Energy Research Abstracts

Abstracts 7087-9199

Office of Scientific and Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction for the Department of Energy's scientific and technical information (STI) program and maintains a centralized base of support to assist Departmental elements in planning, developing, and implementing STI activities. DOE-originated and worldwide literature and software on advances in subjects of interest to DOE researchers are collected, processed, and disseminated using computerized databases, publications, and other media.

This information collection, containing over three million citations, represents a major national resource of scientific and technical information. In addition to information from DOE and its contractors, DOE acquires information through its international partnerships with the International Energy Agency's Energy Technology Data Exchange (ETDE), a consortium comprised of members from North America and Europe, Japan and Korea; the International Atomic Energy Agency's International Nuclear Information System, representing 80 countries; bilateral agreements with foreign governments; exchange agreements with other U.S. government agencies; and contracts with private information organizations and professional societies.

The subject scope of this information extends beyond energy, covering basic scientific studies in such areas as radiology, atomic and nuclear physics, radiation and nuclear chemistry, superconductivity, supercomputers, the environment, health and safety, waste management, nuclear medicine, and arms control.

Major DOE databases are available within the United States through DIALOG Information Services and STN International and outside the United States through formal governmental exchange agreements. DOE and DOE contractor offices can access the databases online through the Integrated Technical Information System (ITIS) maintained by OSTI.

Energy Research Abstracts

Coverage

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports and patent applications originated by the U.S. Department of Energy, its laboratories, energy centers, and contractors, as well as theses and conference papers and proceedings issued by these organizations in report form. Audiovisual materials, computer media (magnetic tapes, diskettes, etc.), and engineering drawings are included in this definition. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations, *provided* that the full text of the document has been received by OSTI. Foreign report information is obtained through the International Energy Agency's 18-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. The purpose of this publication is to announce documents produced or obtained by DOE that are not so readily available as journal articles, books, or patents.

Scope

The scope of *ERA* encompasses DOE's research, development, demonstration, and technology programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for online searching as records within the Energy Science and Technology Database (EDB). The current-year records are available on the Integrated Technical Information System (ITIS).

Availability

DOE and DOE contractors can obtain *ERA* (regular issues and annual indexes) by using VISA, MasterCard, or OSTI deposit accounts. Contact the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA (regular issues and annual indexes) is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Managing Editor, Leota S. Kane
Technical Editor, Barry C. Steele

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

Australia	Norway
Brazil	Poland
Canada	Republic of Korea
Denmark	Spain
Finland	Sweden
France	Switzerland
Germany	The Netherlands
Italy	United Kingdom
Japan	United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 79 countries and 15 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a database for online retrieval. The database serves as well for the production of numerous OSTI publications.

How To Read A Citation

The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Date of publication.** If not known, a processing date is in brackets.
9. **Number of pages** or page range. Prices are based on total pages unless special pricing applies.
10. **Language** of document if non-English.
11. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
12. **Sponsoring organization.**
13. **Contract or grant number.**
14. **Secondary identifying number;** may be a conference number.
15. **Conference title, location, and date,** if applicable.
16. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
17. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
18. **Drop note** or explanatory statement.
19. **Abstract.**
20. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1990. (CONF-900724-Vol.1: Indoor Air '90: 5th international conference on indoor air quality and climate, Toronto (Canada), 29 Jul - 3 aug 1990). In Indoor air '90: The fifth international conference on indoor air quality and climate. Volume 1: Final report. 786p. Order Number DE90017786. Source: NTIS.

Air pollution in houses caused by combustion of coal is more serious than that by combustion of natural gas and methane (primarily by SO_2 and NO_2). The gas concentration after cooking is higher than that before cooking, and it is higher in kitchen than in bedroom and outdoor. There were mutations in the extract from TSP in 30m^2 air in the bedroom, kitchen and outdoor, where coal and natural gas were used. The supernatant saliva activity of children whose family uses coal is significantly lower than that of pumping streams.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 2 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) OSTI prices are based on total pages unless special pricing applies. The public should order from NTIS or from one of the other agencies listed in the citation. NTIS price codes may continue to appear in some records. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts*. Descriptions of entries in these indexes follow.

Corporate Author Index
The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index
Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index
This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index
DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**

Report Number Index
Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438–T1 15:18494 NTIS, OSTI E 1.99: DE89007246 MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the database records.* The following list includes all of the 38 first-level and the 313 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

Numerical Listing of Categories

01 COAL LIGNITE, AND PEAT
- 03 Preparation
- 04 Processing
- 05 Products and By-Products
- 06 Properties and Composition
- 08 Waste Management

7087 (DOE/PC/90308–T2) **A new model of coal-water interaction and relevance for dewatering. Final report.** Suuberg, E.M.; Yun, Y.; Lilly, W.D.; Leung, K.; Gates, T.; Otake, Y.; Deevi, S.C. Brown Univ., Providence, RI (United States). Div. of Engineering. [1995]. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90308. Order Number DE95005767. Source: OSTI; NTIS; GPO Dep.

This project was concerned with developing an improved understanding of how moisture is held in coals. There is a concern that the historically held view, that capillary condensation in pores plays a significant role, could not be correct, since the coal shrinks and swells in response to moisture loss and gain. Thus there is no well-defined pore system for holding the moisture. This appears true for a range of ranks from lignite to high volatile bituminous coal. Instead, it appears that something more like classical swelling of coals in solvents is responsible. This study examined this hypothesis by various means, considering both the mixing thermodynamics of coal and water (or coal and other swelling solvents) and by examining coal's elastic response. The conclusion is that water does indeed behave like many other swelling solvents, but is a somewhat poor swelling solvent. The structure of the water swollen coal appears to remain fairly glassy, implying that many non-covalent crosslinks remain unbroken. The water interacts with coal only at certain types of adsorption sites. This is consistent with a second historical view that polar functionality is responsible for water retention. The filling of these sites, somewhat surprisingly, appeared to involve a strong enthalpic driving force, rather than the entropic driving force that characterizes solvent swelling in other solvents. The practical importance of these results for thermal dewatering processes is that the historical view is supported. That is, that pyrolytic polar group removal is necessary. An alternative suggestion, based upon attempts to further crosslink coal, has not received support.

7088 (DOE/PC/90314–T1) **Hydrocarbon-oil encapsulated air bubble flotation of fine coal. 1st Quarterly report, October 1, 1990–December 31, 1990.** Peng, F.F. West Virginia Univ., Morgantown, WV (United States). [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90314. Order Number DE95005503. Source: OSTI; NTIS; GPO Dep.

In the froth flotation process, whether accomplished In a conventional stirred tank flotation cell, in a column flotation cell, in an air sparged cyclone flotation or in a static-tube cell by using microbubbles, it requires the addition of large quantity of surfactants such as frother and/or collector (or promoter). In coarse coal flotation, special reagents are used such as high molecular weight frothers, the collector with a non-ionic, low foam emulsifier, Sherex Shur Coal 159 or Sherex Shur Coal 168 blended with fuel oil No. 2. These reagents in liquid forms are directly added into the coal pulp in the flotation cell. Frequently, a conditioning tank is required to achieve the dispersion of the reagents. The dispersion of the collector such as hydrocarbon-oil (insoluble or partially soluble) by a mechanical mixer in the coal pulp is often inadequate. In this work, in order to demonstrate the effectiveness of collector droplet size and dispersion on froth flotation processes, a unique gasified collector dispersion and oil-coated bubble generation system was used. The hydrocarbon oil collector was gasified at a temperature approximately 40 degrees C above the fractionation temperature of the collector to avoid pyrolysis. Gasified collector is first mixed in the air stream and transported to the air diffusion hood in the flotation cell. The oil-coated air bubbles were then generated and diffused into solid-water phases.

7089 (DOE/PC/90314–T2) **Hydrocarbon-oil encapsulated bubble flotation of fine coal. Technical progress report for the sixth quarter, January 1, 1992–March 30, 1992.** Peng, F.F.; Cho, E.H. West Virginia Univ., Morgantown, WV (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90314. Order Number DE95005504. Source: OSTI; NTIS; GPO Dep.

Collector dispersion plays an important role in fine coal flotation because the hydrophobicity and thus flotation rate/selectivity may be increased by dispersing the collector. In this study, four modes of collector dispersion techniques were tested. They were mechanical agitation, ultrasonic energy dispersed collector addition, atomized collector addition, and gasified collector addition. These methods were tested on the flotation of four different ranks of the coal samples of -600μm size (-30 mesh US sieve, or -28 mesh Tyler sieve). In addition to flotation experiments, induction time of bubble attachment to the bed of fine coal particles was measured. The ultrasonic energy dispersed and atomized collector addition techniques enhanced flotation yield and most significantly improved the kinetics of fine coal flotation. The gasified collector flotation method could increase the selectivity of separation and decrease the collector consumption. The combustible recovery by the gasified collector flotation was lower than that by the conventional method but the selectivity by the former method was higher than that by the latter method. Application of the four different collector dispersion methods enhanced the hydrophobic character of all the four ranks of the coal samples as was evidenced by the induction time measurement as well as the flotation responses.

7090 (DOE/PC/90314–T3) **Hydrocarbon-oil encapsulate bubble flotation of fine coal. Technical progress report for the seventh quarter, April 1, 1992–June 30, 1992.** Peng, F.F. West Virginia Univ., Morgantown, WV (United States). [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90314. Order Number DE95005505. Source: OSTI; NTIS; GPO Dep.

This reporting period has been devoted in the study of lyophobic characteristics of six ranks of coals which were selected for the study of hydrocarbon-oil encapsulated bubble flotation of fine coals. Additionally, the coal particle surfaces treated with collector using various collector dispersion techniques are also tested in the film flotation. The experimental techniques and instruments used for the measurement of hydrophobicity and floatability of fine coals include (1) Film flotation, (2) Induction timer, (3) Hallimond cell and (4) stirred tank flotation cell are given. The static float and sink test known as the film flotation process were used to characterize the wetting behaviors of the fine coal surfaces. In this flotation technique, the coal particles were tested on the interface of a series of aqueous methanol solution of different surface tensions. The distributions of lyophobic particles as the function of the wetting surface tensions of the particles were obtained. From the frequency distribution of critical surface tensions, the parameters such as the mean critical surface tension, dispersion and average contact angle for the coal particle surfaces were calculated. These parameters characterized the heterogeneity of the coal particle surfaces and correlated well with the induction time, floatability and flotation response data obtained from Hallimond cell and a stirred tank cell. Furthermore, the frequency distributions of hydrophobic surface sites of the particle surfaces were also derived from the results of film flotation tests. These frequency distributions were extended to interpret and predict the flotation rates and recoveries for the coal samples without treating and coal samples treated with collector using various collector dispersion techniques.

7091 (DOE/PC/90314–T4) **Hydrocarbon-oil encapsulate bubble flotation of fine coal. Technical progress report for the eighth quarter, July 1, 1992–September 30, 1992.** Peng, F.F. West Virginia Univ., Morgantown, WV (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract FG22-90PC90314. Order Number DE95005506. Source: OSTI; NTIS; GPO Dep.

A portion of this reporting period has been consumed in the following tasks: (1) development of air-water-frother sparging system using an assemble of two sets of atomizers; (2) conducting the column flotation tests followed $2^6 \times 1/4$ fractional factorial design; (3) to develop a collector gasifier system for formation of hydrocarbon-oil encapsulated bubbles. To effectively remove sulfur and mineral matters from coal, the coal particles must be ground to minus 75 μm (minus 200 U.S. sieve) or less to liberate the pyrite and mineral matters from the coal matrix. As reported in a previous report (Fifth Quarterly report), in order to effectively reduce ash content in fine clean coal products using a 3-in. flotation column, the height of the column must be increased to increase the depth of the frother and the residence time of coal particles in the flotation column. In this study, a series of column flotation tests were conducted on freshly ground minus 75 μm Upper Freeport seam coal. The flotation column is equipped with froth washing device as well as two sets of atomizers for sparging the air-water and frother mixture. The operation of column flotation involves the multiplicity of control variables. Thus, three phases of work plan were used to minimize the number of tests. In this report, the results of column flotation tests obtained in the third phase of the experiment work are reported. The column flotation is capable of achieving 90 percent or more of combustible recovery and 70 percent or more of ash rejection from the raw coal contained 20 percent or greater ash content. The main objectives of this reporting period are: (1) to establish a test procedure, and to determine the optimal height of flotation column and operating conditions for cleaning minus 75 μm Upper Freeport seam coal, and (2) to extend the test procedure and the operating conditions established to clean various seam coals using a hydrocarbon-oil encapsulated bubble flotation.

7092 (DOE/PC/90314–T5) **Hydrocarbon-oil encapsulated bubble flotation of fine coal. Technical progress report for the ninth quarter, October 1, 1992–December 31, 1992.** Peng, F.F. West Virginia Univ., Morgantown, WV (United States). Dept. of Mineral Processing Engineering. [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90314. Order Number DE95005507. Source: OSTI; NTIS; GPO Dep.

A main portion of this reporting period has been consumed in the following tasks to establish the base line for hydrocarbon oil encapsulated bubble flotation: (1) to measure the residence time distribution and formulate the axial dispersion model of 1-in. I.D. flotation column, (2) to obtain the optimum operating conditions using three phase experiment design approach followed the fractional factorial design, (3) to develop the column scale-up procedure and formulate recovery predicting model for flotation column, (4) to apply the models developed to design a 3-in. ID flotation column and predicting the cleaning results, (5) to test the collector gasification system installed on the 3-in. I.D. flotation column for hydrocarbon-oil capsulated bubble flotation of fine coal. Column flotation of minus 47 μm (-400 US sieve) Pittsburgh No. 8 seam coal was carried out to study the column scale-up procedure using one-inch column. The dispersion model of nonideal flow was applied to describe the hydrodynamic state within the column. This model may be used to predict the collection zone recovery of column flotation in scale-up procedure if the column flotation is a first-order rate process. Residence Time Distribution (RTD) data of the column flotation were measured to determine the parameters of the model. It was found that an empirical distribution, logarithmic normal distribution can describe the RTD curve well. The effects of operating variables and column geometry on the Peclet number, Pe, which measure the extent of axial dispersion were studied and an empirical expression of Pe was obtained. Using the dispersion model, the column flotation of fine coal recovery can be predicted.

7093 (DOE/PC/90314–T6) **Hydrocarbon-oil encapsulated air bubble flotation of fine coal. Technical progress report for the second quarter, January 1, 1991–March 31, 1991.** Peng, F.F. West Virginia Univ., Morgantown, WV (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90314. Order Number DE95005508. Source: OSTI; NTIS; GPO Dep.

The objective of the present work is to have a good understanding on the fundamentals of modes of reagent/collector dispersion and adsorbing collector on the bubbles to improve the selectivity and recovery of fine coal flotation. A portion of this reporting period has been consumed in building experimental apparatus and equipment. These include an automated flotation machine, a computer-based induction time apparatus, a bubble charge measuring apparatus, continuous flotation column, etc. An automated flotation machine was constructed for Denver model D-12 with 2- and 4-liter cells. The standard test procedure was established for using the machine with improved pulp level control and constant frother removal to minimize the human error. The flotation results of Upper Freeport coal sample showed a good reproducibility for using the improved automatic flotation machine/cell. The reagentless flotation was conducted in a Hallimond tube to determine the hydrophobicity of coal particles. Upper Freeport coal samples were used for all of the tests including -30 mesh, -200 mesh and -400 mesh U.S. sieves coal samples. High floatability was obtained for Upper Freeport coal samples. The significant entrainment of fine particles were observed for coal samples with -200 mesh and -400 mesh U.S. Sieve samples. The electrokinetic properties of coal particles from Upper Freeport seam was determined as the function of pH, frother or collector concentrations. The IEP of -200 mesh coal particle was at pHaw.53. The zeta potential of the coal particles with or without addition of MIBC or kerosene were exhibited negative values for pH greater than 3 and decreased with increasing pH values. The coal particles with kerosene has the higher zeta-potential value than that of particles with MIBC or free of frother/collector. The negative zeta-potential of coal sample was also observed regardless of MIBC concentration employed.

7094 (DOE/PC/90314–T7) **Hydrocarbon-oil encapsulated air bubble flotation of fine coal. Technical progress report for the third quarter, April 1, 1991–June 30, 1991.** Peng, F.F. West Virginia Univ., Morgantown, WV (United States). Dept. of Mineral Processing Engineering. [1995]. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90314. Order Number DE95005509. Source: OSTI; NTIS; GPO Dep.

This report is concerned with the progress made during the third period of the two year project. A significant portion of this reporting period has been consumed in measurement of induction time of oil-free and oil-coated bubbles, modification of collector gasifier, hydrocarbon oil encapsulated flotation tests and float and sink analyses of various rank of coal samples, building a 1-inch column cell, as well as building the ultrasound collector emulsification apparatus. Induction time has been measured using an Electronic Induction Timer. The results indicate that alteration of chemical properties of air bubble by applying hydrocarbon oil or reagent can drastically improve the rate of flotation process. Various techniques have been employed in hydrocarbon oil encapsulated flotation processes to further enhance the selectivity of the process, which include: (1) gasified collector flotation with addition of gasified collector into the air stream in the initial stage; (2) two-stage (rougher-cleaner) gasified collector flotation; and (3) starvation gasified collector flotation by addition of gasified collector at various flotation times. Among these, three techniques used in hydrocarbon oil encapsulated flotation process, the starvation flotation technique provides the best selectivity.

7095 (DOE/PC/90314–T8) **Hydrocarbon-oil encapsulated bubble flotation of fine coal. Technical progress report for the fourth quarter, July 1, 1991–September 30, 1991.** Peng, F.F. West Virginia Univ., Morgantown, WV (United States). [1995]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90314. Order Number DE95005510. Source: OSTI; NTIS; GPO Dep.

This report is concerned with the progress made during the fourth period of the research Project, Grant no. DE-FG22-90-PC90314. A main portion of this reporting period has been consumed in the following tasks: (i) induction time measurement for the coal particles prepared by using various modes of collector addition techniques; (ii) ultrasonic energy dispersed collector flotation tests; (iii) natural floatability measurement using Hallimond tube flotation cell; (iv) preparation and operation of 3-inch column

cell, and (v) preparation of wettability measurement using film flotation method. The coal samples used in this period of work are four ranks of coal samples from Mammoth (Anthracite), Lower Kittanning, Upper Freeport and Pittsburgh No. 8 seam coals. The results showed that a drastic improvement in the flotation rate and yield were achieved by using the ultrasonic energy dispersed collector flotation compared to that of conventional flotation. The techniques of direct liquid addition and addition of ultrasonic energy dispersed collector are mainly for alteration of the hydrophobicity distribution of coal particle surfaces. On the contrary, the gasified collector addition to the gas phase technique is for alteration of the chemical properties of bubble surfaces. Among these techniques, however, the results showed that the hydrocarbon oil encapsulated bubble flotation is more selective than either ultrasonic energy dispersed collector flotation process or conventional flotation process. Induction time measurement was continued and extended to the coal samples received in this period of work, using oil free air bubble and oil-coated air bubbles. Induction time for oil-coated bubbles is significantly shorter than that of oil-free bubbles for all the coal samples used. A good agreement between flotation responses and induction time were obtained for all the coal samples under the conditions of various modes of collector dispersion.

7096 (DOE/PC/92206–T7) **Bench-scale testing of the micronized magnetite process. Quarterly technical progress report No. 1, July–September 1994.** AMAX R and D, Inc., Pittsburgh, PA (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC92206. Order Number DE95005769. Source: OSTI; NTIS; GPO Dep.

The primary project objectives are: test the feasibility (ie., magnetite losses) of a fully-integrated, conventional wet-drum separator circuit for magnetite recovery. If losses are too high (greater than 10 #/ton), we will try HGMS.; determine the impact of changing recirculating media quality on heavymedia cyclone performance. If losses are low (less than 5#/ton), the magnetite changes will be insignificant. The only changes will then be degree of fine-coal contamination of the media. The testing will be done with 2 to 3 grades of micronized magnetite (differing sizes and perhaps qualities), and 2 to 3 different bituminous coals (Pittsburgh and a softer coal). The secondary objectives, in which Custom Coals is also interested, include: Test the application of drain and rinse screens down to finer sizes than previously tested (200 to 325 mesh); determine the feasibility of using single circuitry to feed a wider size range (28 x 325 mesh). During July 1994, Custom Coals, Int. and AMAX R&D signed the novation agreement switching the prime contract for the Micronized Magnetite Project to Custom Coals. However, no project work was performed during July and August, 1994. The major focus of the work performed in September was: Finalizing the Equipment List for major purchases; finalizing the Circuit Flowsheet and P&ID. This report summarizes the results from those efforts, and introduces the new project objectives, schedule, an budget. The final section contains the major priorities for the next quarter (October through December, 1994).

7097 (DOE/PC/92246–T7) **Development of enhanced sulfur rejection processes. Final technical progress report, July 1–September 30, 1993.** Yoon, R.H.; Luttrell, G.; Adel, G.; Richardson, P.E. Virginia Center for Coal and Minerals Processing, Blacksburg, VA (United States). 12 Nov 1993. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92246. Order Number DE95005551. Source: OSTI; NTIS; GPO Dep.

Research at Virginia Tech led to the development of two complementary concepts for improving the removal of inorganic sulfur from many eastern US coals. These concepts are referred to as Electrochemically Enhanced Sulfur Rejection (EESR) and Polymer Enhanced Sulfur Rejection (PESR). The EESR process uses electrochemical techniques to suppress the formation of hydrophobic oxidation products believed to be responsible for the floatability of coal pyrite. The PESR process uses polymeric reagents that react with pyrite and convert floatable middlings, i.e., composite particles composed of pyrite with coal inclusions, into hydrophilic particles. These new pyritic-sulfur rejection processes do not require significant modifications to existing coal preparation facilities, thereby enhancing their adoptability by the coal industry. It is believed that these processes can be used simultaneously to maximize the rejection of both well-liberated pyrite and composite coal-pyrite particles. The technical research was initiated on October 1, 1992, and a detailed work plan and work schedule (Task 1) were developed. During this reporting period, research was conducted to evaluate the liberation characteristics of various pyrite samples (Task 2), to further characterize the oxidation behavior of pyrite using electrochemical and X-ray photoelectron spectroscopy and evaluate the use of sacrificial anode materials as a practical method of depressing pyrite (Task 5), and investigate the use of polymers containing a variety of functional groups to depress pyrite (Task 6).

7098 (DOE/PC/92521–T193) **Removal of pyrite and trace elements from waste coal by dissolved-CO_2 flotation and chelating agents. Final technical report, September 1, 1993–August 31, 1994.** Shiao, S.Y. (Babcock and Wilcox Co., New Orleans, LA (United States)); Ho, K. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1994]. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-92PC92521. Order Number DE95005564. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project was to use ultrafine bubbles generated by dissolved $C0_2$ to recover useable fuel, and reject pyrite and other minerals from a waste coal in flotation. In addition, a chelating agent was used to remove trace metals from the froth products. Illinois No. 6 waste coal obtained from a refuse thickener of a coal cleaning circuit was used as the feed in flotation. The as-received waste coal had a top size of 2400 microns. The waste coal was ground to −75 microns (−200 mesh) and −44 microns (−325 mesh). The as-received and the ground waste coal samples were subjected to flotation. Dissolved-CO_2 flotation tests were performed mainly in a 3-inch diameter by 8 feet high packed column under various test conditions. Some tests were also performed in a 2-inch diameter microbubble column for comparison. The flotation performance of the waste coal in the microbubble column was higher than that for the packed column. The packing in the packed column hindered the coal flotation. The separation efficiency of the ground coal was less than that for the asreceived coal. Flotation of the waste coal was also performed in the packed column using coarser bubbles generated by dispersed $C0_2$ and air. The separation efficiency of the ground waste coal of 44 microns top size was higher than that for dissolved-CO_2 flotation. Additives were used to modify the waste coal surfaces. Triton-X 100, a nonionic surfactant and EDTA, a chelating agent, increased the separation efficiency of the waste coal.Most of the trace metals in coal were reduced in different degrees by flotation. Triton X-100 or EDTA enhanced removal of chromium, nickel, and selenium. Applying EDTA to the froth products further removed lead significantly.

7099 (DOE/PC/93203–T4) **Electrostatic beneficiation of coal. Quarterly technical progress report, July 1, 1994–September 30, 1994.** Mazumder, M.K.; Lindquist, D.; Tennal, K.B. Arkansas Univ., Little Rock, AR (United States). Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93203. Order Number DE95006244. Source: OSTI; NTIS; GPO Dep.

Experiments were continued to measure average charge for the negative fraction, for the positive fraction and for the non-separated fraction. Freshly ground Illinois No. 6 coal was used. Construction of the parallel plate separator was continued. Results on triboelectric separation of coal powder are reported. Charge-to-mass ratios were measured for coal using the E-SPART Analyzer. Development continued on an optical image analysis method. Preliminary data were obtained on the surface content and surface area of the coal powders.

7100 (DOE/PC/94116–T1) **Emissions reductions in coal-fired home heating stoves through use of briquettes. Quarterly report, April 1, 1994–June 30, 1994.** Jozewicz, W. Acurex Corp., Research Triangle Park, NC (United States). 28 Jul 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94PC94116. Order Number DE95005554. Source: OSTI; NTIS; GPO Dep.

The objective of the work is to create a commercially successful venture to market a low-emission coal briquette to the residential heating market in Krakow. Drilling Phase I, small quantities of the

briquetted product will be manufactured and tested. Five Polish coals and two Polish sources of binder material will be tested to determine their amenability to forming briquettes. Small-scale combustion tests will also be performed during Phase I to determine the effectiveness of the briquettes in reducing emissions. A preliminary engineering review for the Phase II briquetting plant will also be performed. Construction of a new plant in Katowice to serve the Krakow market is being considered. This quarter has been a period of startup for this project. Contractual requirements have been completed with several partners. One proposed partner has withdrawn; a replacement organization has been identified. An assistant project manager has been hired and deployed to Krakow. Several deliverables have been completed including the Draft Project Management Plan, Foreign Travel Report, Hazardous Substance Plan, and the Test Plan for Akademia Gorniczo Hutnicza (AGH). Official appraisals for Przedsiebiorstwo Energetyki Cieplnej (PEC) and INCO Veritas have also been delivered. Initial briquetting experiments have been completed. Several presentations were made and two papers were submitted for conferences that will be held in the next quarter.

7101 (DOE/PC/94116–T2) **Emissions reductions in coal-fired home heating stoves through use of briquettes. Quarterly report, July 1, 1994–September 30, 1994.** Acurex Environmental Corp., Research Triangle Park, NC (United States). 28 Oct 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94PC94116. Order Number DE95005763. Source: OSTI; NTIS; GPO Dep.

This quarter has seen additional experimentation in the briquette formulation. Several combustion tests have been performed. Many of the results are presented here, though the organics analysis is still in progress. Several deliverables have been completed. These include the revised proposal requested by the US Department of Energy (DOE) and a revised Project Management Plan. Two presentations were made, and a paper was submitted for a conference to be held next quarter. Facility modifications have been proceeding at Euromining Consulting's Brikpol facility at Bogdanka. Business development, however, is on hold while Acurex Environmental awaits DOE's approval of the revised proposal and a revised contract.

7102 (DOE/MC/26366–3962) **A calcium oxide sorbent process for bulk separation of carbon dioxide.** Harrison, D.P. Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Chemical Engineering. Oct 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26366. Order Number DE95006089. Source: OSTI; NTIS; GPO Dep.

Feasibility is being studied for a high-temperature, high-pressure process for bulk separation of CO_2 from coal-derived gas. In Phase I, an electrobalance reactor was used toestablish the technical feasibility of the regenerable sorbent process. Phase II involved scaleup from microgram to gram quantities sof sorbent and a switch from the electrobalance reactor to a fixed-bed reactor with capability for feed and product gas analysis.

7103 (DOE/MC/27391–3943) **Scale-up of mild gasification to a process development unit. Quarterly report, February 1994–May 1994.** Doane, E.P.; Carty, R.H.; Foster, H. Kerr-McGee Coal Corp., Oklahoma City, OK (United States). Nov 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC27391. Order Number DE95000038. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to develop the IGT Mild-Gasification (MILDGAS) process for near-term commercialization. The specific objectives of the program are to: (1) design, construct, and operate a 24-tons/day adiabatic process development unit (PDU) to obtain process performance data suitable for further design scaleup; (2) obtain large batches of coal-derived co-products for industrial evaluation; (3) prepare a detailed design of a demonstration unit; (4) develop technical and economic plans for commercialization of the NMDGAS process. The project team that is performing the initial phases of the PDU development are: Kerr-McGee Coal Corporation (K-M Coal), the Institute of Gas Technology (IGT), Bechtel Corporation (Bechtel), and Southern Illinois University at Carbondale (SIUC). The MILDGAS process is a continuous closed system for producing liquid and solid (char) co-products at mild operating conditions up to 50 psig and 1300°F. It is capable of processing a wide range of both eastern caking and western noncaking coals. The 1 ton/hr PDU facility that is to be constructed is comprised of a 2.5-ft ID adiabatic gasifier for the production of gases, coal liquids, and char; a three-stage condensation train to condense and store the liquid products; and coal feeding and char handling equipment. The facility will also incorporate support equipment for environmentally acceptable disposal of process waste. This quarter, the bids from Bateman Engineering and Kilborn Engineering were analyzed and Kilborn appeared to be the successful bidder. Negotiations with Kilborn Engineering to finalize the exact scope and cost of their bid were undertaken but Kilborn is unwilling to assume the standard flowdown liability clause. Because of this impasse, alternatives to Kilborn are being explored.

7104 (DOE/MC/29246–3941) **Hot coal gas desulfurization with manganese-based sorbents. Final report, September 1992–December 1994.** Hepworth, M.T.; Slimane, R.B. Minnesota Univ., Minneapolis, MN (United States). Nov 1994. 165p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29246. Order Number DE95000034. Source: OSTI; NTIS; GPO Dep.

The focus of much current work being performed by the Morgantown Energy Technology Center (METC) of the Department of Energy on hot coal-derived fuel gas desulfurization is in the use of zinc-based sorbents. METC has shown interest in formulating and testing manganese-based pellets as alternative effective sulfur sorbents in the 700 to 1200°C temperature range. To substantiate the potential superiority of Mn-based pellets, a systematic approach toward the evaluation of the desulfurizing power of single-metal sorbents is developed based on thermodynamic considerations. This novel procedure considered several metal-based sorbents and singled out manganese oxide as a prime candidate sorbent capable of being utilized under a wide temperature range, irrespective of the reducing power (determined by CO_2/CO ratio) of the fuel gas. Then, the thermodynamic feasibility of using Mn-based pellets for the removal of H_2S from hot-coal derived fuel gases, and the subsequent oxidative regeneration of loaded (sulfided) pellets was established. It was concluded that MnO is the stable form of manganese for virtually all commercially available coal-derived fuel gases. In addition, the objective of reducing the H_2S concentration below 150 ppMv to satisfy the integrated gasification combined cycle system requirement was shown to be thermodynamically feasible. A novel process is developed for the manufacture of Mn-based spherical pellets which have the desired physical and chemical characteristics required.

7105 (DOE/MC/29246–3944) **Hot coal gas desulfurization with manganese-based sorbents.** Hepworth, M.T.; Ben-Slimane, R. Minnesota Univ., Minneapolis, MN (United States). Dec 1994. 24p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). DOE Contract AC21-92MC29246. Grant USDI-BM/C0299002-Mod.3. Order Number DE95000036. Source: OSTI; NTIS; GPO Dep.

The focus of work being performed on Hot Coal Gas Desulfurization at the Morgantown Energy Technology Center is primarily in the use of zinc ferrite and zinc titanate sorbents; however, prior studies indicated that an alternate sorbent, manganese dioxide-containing ore in mixture with alumina (75 wt % ore + 25 wt % Al_2O_3) may be a viable alternative to zinc-based sorbents. Manganese, for example, has a lower vapor pressure in the elemental state than zinc hence it is not as likely to undergo depletion from the sorbent surface upon loading and regeneration cycles. Also manganese oxide is less readily reduced to the elemental state than iron hence the range of reduction potentials for oxygen is somewhat greater than for zinc ferrite. In addition, thermodynamic analysis of the manganese-oxygen-sulfur system shows it to be less amenable to sulfation than zinc ferrite. Potential also exists for

utilization of manganese at higher temperatures than zinc ferrite or zinc titanate. This annual topical report documents progress in pelletizing and testing via thermo-gravimetric analysis of individual pellet formulations of manganese ore/alumina combinations and also manganese carbonate/alumina with two binders, dextrin and bentonite.

7106 (DOE/MC/29444–3984) **Toms Creek Integrated Gasification Combined Cycle Demonstration Project. Quarterly progress report, July 1, 1994–September 30, 1994.** Wahlroos, H. (Enviropower, Inc., Tampere (Finland)); Ghazanfari, R.; Horvath, A.; Mojtahedi, W. TAMCO Power Partners, Williamsport, PA (United States); Enviropower, Inc., Tampere (Finland). [1994]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-93MC29444. Order Number DE95006221. Source: OSTI; NTIS; GPO Dep.

This Quarterly report for the period ending September 30, 1994, summarizes work done by Tampella Power Corporation. Site specific heat and material balances were prepared for possible alternate sites, plant cost estimates were prepared and reviewed, and the gasification pilot plant in Tampere, Finland, was visited.

7107 (DOE/MC/30012–3980) **Advanced sulfur control concepts in hot-gas desulfurization technology: Phase 1, Feasibility of the direct production of elemental sulfur during the regeneration of high temperature desulfurization sorbents.** Lopez, A.; White, J.; Groves, F.R.; Harrison, D.P. Louisiana State Univ., Baton Rouge, LA (United States). Oct 1994. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-94MC30012. Order Number DE95006160. Source: OSTI; NTIS; GPO Dep.

This topical report de-scribes the results of Phase 1 research performed during the first six months of a three-year contract to study the feasibility of the direct production of elemental sulfur during the regeneration of high temperature desulfurization sorbents. Much effort has gone into the development of a high-temperature meal oxide sorbent process for removal of H_2S from the coal gas. A number of sorbents based upon metals such as zinc, iron, manganese and others have been studied. In order for high temperature desulfurization to be economical it is necessary that the sorbents be regenerated to permit multicycle operation. Current methods of sorbent regeneration involve oxidation of the metal sulfide to reform the metal oxide and free the sulfur as SO_2. An alternate regeneration process in which the sulfur is liberated in elemental form is preferable. The overall objective of the current research is to study simpler and economically superior processing of known sorbents capable of producing elemental sulfur during regeneration. This topical report summarizes the first steps of this effort. A literature search has been completed to identify possible regeneration concepts and to collect relevant thermodynamic, kinetic, and process data. Three concepts involving reaction with SO_2, partial oxidation using an $O_2 - H_2O$ mixture, and steam regeneration have been identified. The first two concepts result in the direct production of elemental sulfur while H_2S is the product of steam regeneration. This concept is of potential interest, however, since existing Claus technology can be used to convert H_2S to elemental sulfur. Following the literature search, a thermodynamic analysis, based upon free-energy minimization was carried out to evaluate candidate sorbents for possible use with the three regeneration concepts.

7108 (DOE/METC/C–94/7150) **Pilot gasification and hot gas cleanup operations.** Rockey, J.M.; Galloway, E.; Thomson, T.A.; Rutten, J.; Lui, A. USDOE Morgantown Energy Technology Center, WV (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). (CONF-9406131–66: Coal-fired power systems: advances in IGCC and PFBC review meeting, Morgantown, WV (United States), 21-23 Jun 1994). Order Number DE95003385. Source: OSTI; NTIS; GPO Dep.

The Morgantown Energy Technology Center (METC) has an integrated gasification hot gas cleanup facility to develop gasification, hot particulate and desulfurization process performance data for IGCC systems. The objective of our program is to develop fluidized-bed process performance data for hot gas desulfurization and to further test promising sorbents from lab-scale screening studies at highpressure (300 psia), and temperatures (1,200°F) using coal-derived fuel gases from a fluid-bed gasifier. The 10-inch inside diameter (ID), nominal 80 lb/hr, air blown gasifier is capable of providing about 300 lb/hr of low BTU gas at 1,000°F and 425 psig to downstream cleanup devices. The system includes several particle removal stages, which provide the capability to tailor the particle loading to the cleanup section. The gas pressure is reduced to approximately 300 psia and filtered by a candle filter vessel containing up to four filter cartridges. For batch-mode desulfurization test operations, the filtered coal gas is fed to a 6-inch ID, fluid-bed reactor that is preloaded with desulfurization sorbent. Over 400 hours of gasifier operation was logged in 1993 including 384 hours of integration with the cleanup rig. System baseline studies without desulfurization sorbent and repeatability checks with zinc ferrite sorbent were conducted before testing with the then most advanced zinc titanate sorbents, ZT-002 and ZR-005. In addition to the desulfurization testing, candle filters were tested for the duration of the 384 hours of integrated operation. One filter was taken out of service after 254 hours of filtering while another was left in service. At the conclusion of testing this year it is expected that 3 candles, one each with 254, 530, and 784 hours of filtering will be available for analysis for effects of the exposure to the coal gas environment.

7109 (DOE/MT/93005–4) **Simultaneous removal of H_2S and NH_3 in coal gasification processes. Quarterly report, July 1, 1994–September 30, 1994.** Jothimurugesan, K.; Adeyiga, A.A.; Gangwal, S.K. Hampton Univ., VA (United States). Dept. of Engineering. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93MT93005. Order Number DE95005382. Source: OSTI; NTIS; GPO Dep.

The objective of this study is to develop advanced high-temperature coal gas desulfurization mixed-metal oxide sorbents with stable ammonia decomposition materials at 550-800°C (1022-1472°F). The specific objectives of the project are to: (i) develop combined sorbent-catalyst materials capable of removing hydrogen sulfide to less than 20 ppmv and ammonia by at least 90 percent. (ii) Carry out comparative fixed-bed studies of absorption and regeneration with various formulations of sorbent-catalyst systems and select most promising sorbent-catalyst type. (iii) Conduct long-term (at least 30 cycles) durability and chemical reactivity in the fixed-bed with the superior sorbent-catalyst.

7110 (DOE/PC/79819–12) **Bench-scale development of coal/oil co-processing technology. Twelfth quarterly report, 1 July–30 September 1990.** Duddy, J.E.; Panvelker, S.V. Hydrocarbon Research, Inc., Princeton, NJ (United States). Nov 1990. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-87PC79819. Order Number DE95005204. Source: OSTI; NTIS; GPO Dep.

This quarterly progress report presents the status of work on the Bench-Scale Development of Coal/Oil Co-Processing Technology. The technology being developed is the HRI Coal/Oil Co-Processing Technology based on two-stage catalytic, ebullated-bed processing. Bench-scale work is being performed at Hydrocarbon Research, Inc. (HRI) with laboratory-scale support work by the Alberta Research Council (ARC). Activities during the 12th quarter of this project have included the following: A contract modification was executed to extend the program through the end of 1990 and to add a bench-scale operation; A draft of the Topical Report No. 1 was delivered to DOE; Bench Run No. 9 was completed evaluating the effect of coal concentration on reactivity in once-through operations.

7111 (DOE/PC/89788–T15) **Novel process for depolymerization of coal to C_2-C_4 hydrocarbons. Final report, 1 September 1989–31 August 1993.** Wiser, W.H.; Oblad, A.G. Utah Univ., Salt Lake City, UT (United States). 8 Jul 1994. 238p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89PC89788. Order Number DE95000355. Source: OSTI; NTIS; GPO Dep.

A principal objective of this work was to study the conversion of coal to $C_2 - C_4$ hydrocarbons in a two-stage reactor system. Coal was converted to liquids at 440°C in a stirred batch autoclave using tetralin as the hydrogen donor solvent. The liquids produced were separated from the unreacted coal and ash by filtration. The liquids were then fed into a second stage fixed bed reactor containing sulfided Ni-Mo/Al_2O_3 and SiO_2-Al_2O_3 catalyst. The liquids

were hydrocracked on the dual functional catalyst giving high yields of C_2 – C_4. hydrocarbons. The pressure was 1800 psi and the temperatures were in the range of 425 to 500°C. The kinetic parameters of the conversion of coal liquids to gases were determined. The activation energy was determined.

7112 (DOE/PC/89903–T16) **Molecular biological enhancement of coal desulfurization: Cloning and expression of the sulfoxide/sulfone/sulfonate/sulfate genes in pseudomonads and Thiobacillae. First quarterly report, July 1989–September 1989.** Krawiec, S. Lehigh Univ., Bethlehem, PA (United States). Center for Molecular Bioscience and Biotechnology. 20 Oct 1989. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89903. Order Number DE95004453. Source: OSTI; NTIS; GPO Dep.

This contract was established on July 20, 1989. This first quarterly report pertains to the isolation, identification, and acquisition of organisms, perceived refinements to the fluorescent spray plate technique, optimization of mating protocols, production of autotrophs, refinement of procedures for the isolation of plasmids, and definition of procedures to be used in the identification and use of R primes.

7113 (DOE/PC/89903–T17) **Molecular biological enhancement of coal desulfurization: Cloning and expression of the sulfoxide/sulfone/sulfonate/sulfate genes in pseudomonads and Thiobacillae. Third quarterly report, January 1990–March 1990.** Krawiec, S. Lehigh Univ., Bethlehem, PA (United States). Center for Molecular Bioscience and Biotechnology. 20 Apr 1990. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89903. Order Number DE95004454. Source: OSTI; NTIS; GPO Dep.

This contract was established on July 20, 1989. This first quarterly report pertains to the isolation, identification, and acquisition of organisms, perceived refinements to the fluorescent spray plate technique, optimization of mating protocols, production of autotrophs, refinement of procedures for the isolation of plasmids, and definition of procedures to be used in the identification and use of R primes. A mating regime has been developed which effectively selects against soil transconjugants serving as donors and for recipients derived from P. aeruginosa 278583. Three methionine auxotrophs and a histidine auxotroph have been generated in P. aeruginosa 27853 by transposon mutagenesis. A new lysis by alkali method has been successfully used to prepare plasmids R68.45, pLA2917, and pRK2013.

7114 (DOE/PC/89903–T18) **Molecular biological enhancement of coal desulfurization. Final report.** Krawiec, S. Lehigh Univ., Bethlehem, PA (United States). Dept. of Molecular Biology. [1995]. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89903. Order Number DE95004455. Source: OSTI; NTIS; GPO Dep.

Fresh isolates of bacteria presumptively identified as R. erythropolis unequivocally have a $DbtS^+$ phenotype. The production of OH-BP from either DBT or $DBTO_2$ was confirmed by difference spectroscopy, HPLC, and mass spectrometry. The temperature, pH, and means of supplying the thiophenic or sulfonic sole source of sulfur were optimized. The maximal rate of growth of the organism, its affinity for sulfone, and the extent to which substrate was converted to product were determined by using batch, fed batch, and continuous cultures. For strain N1-36, the maximum specific growth rate was 0.235 hr^{-1} which corresponds to a minimal generation time of 2.95 hr. The K_s was estimated to be 0.39 μM. With 100 μM DBT as the sole sulfur source, approximately 40 μM OH-BP are produced (after 40 hr of growth); with 100 μM $DBTO_2$ as the sole sulfur source, approximately 70 μM OH-BP are produced (after 40 hr of growth). The desulfurization activity is repressed by $SO_4^=$ OH-BP does not serve as a carbon source. The $DbtS^+$ phenotype of the R. erythropolis isolates is stable and discrete. The isolates selectively remove sulfur from DBT, a compound which models a refractory form of organic sulfur in compounds characteristic of fossil fuels. The desulfurization occurs with no oxidation of carbon-carbon bonds. The stability and specificity (along with genetic regulation) indicate that microbial desulfurization in a real phenomenon in which a noxious element is removed without significantly affecting the calorific value of the substrate. Additional characterization (and optimization) would provide the basis of a very important form of fossil fuel beneficiation.

7115 (DOE/PC/91027–1) **Macromolecular structure analysis and effective liquefaction pretreatment. Quarterly technical progress report, 1 January 1991–31 March 1991.** Suuberg, E.M.; Yu, Y.; Lilly, W.D. Brown Univ., Providence, RI (United States). Div. of Engineering. [1991]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91027. Order Number DE95005702. Source: OSTI; NTIS; GPO Dep.

This project studies swelling of coals by solvents with application to coal liquefaction. Solvent swelling offers a measure of how well the insoluble 3-D network structure of coal has been disrupted. Preliquefaction swelling of coals can also be a valuable processing step: it may be used to introduce catalysts into the structure, or merely to loosen the structure so that donor solvent entry is promoted or retrograde reactions are inhibited. A class of solvents was investigated for introducing highly dispersed catalysts into the structure of coal: short-chain alkyl naphthalenes and alcohol-alkyl naphthalene mixtures; Utah Blind Canyon coal was used. Effects of thermal treatment on macromolecular structure of coal was also investigated, using combined differential scanning calorimetry and solvent swelling. Results on bituminous coals show that this combination can provide new insights into the complicated prepyrolysis or preliquefaction changes that occur in coals.

7116 (DOE/PC/91027–2) **Macromolecular structure analysis and effective liquefaction pretreatment. Quarterly technical progress report, 1 April 1991–30 June 1991.** Suuberg, E.M.; Yun, Y.; Lilly, W.D. Brown Univ., Providence, RI (United States). Div. of Engineering. [1991]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91027. Order Number DE95005703. Source: OSTI; NTIS; GPO Dep.

Differential scanning calorimetry (DSC) and solvent swelling were used to evaluate structural changes at low temperatures (<350 C) before any major pyrolytic bond breakage occurs. Results reveal existence of reversible structural changes together with an irreversible transition, centered around 200-300 C in three high volatile bituminous coals, and 300 to 400 C in higher rank bituminous coals. DSC thermograms appear to correlate with THF swelling profiles, to furnish information on structural relaxation. The temperature of the structural relaxation appears lower than that for major thermal degradation under atmospheric pressure.

7117 (DOE/PC/91027–3) **Macromolecular structure analysis and effective liquefaction pretreatment. Quarterly technical progress report, 1 July 1991–30 September 1991.** Suuberg, E.M.; Yun, Y.; Lilly, W.D. Brown Univ., Providence, RI (United States). Div. of Engineering. [1991]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91027. Order Number DE95005704. Source: OSTI; NTIS; GPO Dep.

Studies were carried out on effects of heating rate and solvent swelling on glass transition in coal and on elastic behavior of coals in mercury porosimeter.

7118 (DOE/PC/91027–4) **Macromolecular structure analysis and effective liquefaction pretreatment. Annual technical report, [October 1991–December 1991].** Suuberg, E.M.; Yun, Y.; Lilly, W.D. Brown Univ., Providence, RI (United States). Div. of Engineering. Feb 1992. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91027. Order Number DE95005705. Source: OSTI; NTIS; GPO Dep.

This report is divided into 5, stand-alone chapters. After a chapter on the approach of the project, the nd chapter presents an introduction to combining different techniques for analyzing pre- pyrolysis changes in macromolecular configuration. The 3rd chapter amplifies on the nd chapter and considers the behavior of a wider range of ranks. The 4th chapter concerns synergistic effects of mixed solvents in inducing desired structural changes in coals (CS_2 + electron donor solvents; aromatic hydrocarbon-alcohol or HC-alcohol mixtures). Finally, the 5th chapter is a brief on the efforts to characterize the structure of coals using elasticity measurements.

7119 (DOE/PC/91027–5) **Macromolecular structure analysis and effective liquefaction pretreatment. Quarterly technical progress report, 1 January 1992–31 March 1992.** Suuberg, E.M.;

Yun, Y.; Lilly, W.D. Brown Univ., Providence, RI (United States). Div. of Engineering. [1992]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91027. Order Number DE95005706. Source: OSTI; NTIS; GPO Dep.

This report is divided into: effects of aerial oxidation on macromolecular structure of pretreated coals, and physical transitions in low-rank coals. Heat-treated (structurally relaxed) coals are sensitive to aerial oxidation, but on a scale of hours, not minutes, even above 100 C. Upper Freeport coal's swellability was enhanced by oxidation, its extractability decreased; Pittsburgh No. 8 coal's swellability was decreased, its extractability largely unaffected. it is suggested that aerial oxidation is concerned with certain specific components in coal structure, irrespective coal rank or pretreatment. DSC results on as-recieved low-rank coals were overshadowed by a large endothermic peak of water evaporation up to 250 C.

7120 (DOE/PC/91027–6) **Macromolecular structure analysis and effective liquefaction pretreatment. Quarterly technical progress report, 1 April 1992–30 June 1992.** Suuberg, E.M.; Yun, Y.; Lilly, W.D. Brown Univ., Providence, RI (United States). Div. of Engineering. [1992]. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91027. Order Number DE95005707. Source: OSTI; NTIS; GPO Dep.

Experiments show that combined DSC-solvent swelling provide insight into heat- and solvent-induced macromolecular structural changes in coal. In Pittsburgh No. 8 bitu. coal, there is a structural transition at 250 to 400 C. There are thermally induced (prepyrolysis) structural relaxations in bituminous coals at 270-430 C that make them more easily penetrable, swellable, and extractable in solvents. These relaxations are not observed in subbituminous and lignite; in these low-rank coals, gradual crosslinking with temperature was dominant. In medium and low volatile bituminous rank, the relaxation was much more pronounced. As in polymers, the relaxation transitions in coals depend strongly on heating rate. No relaxation was caused by pyridine preswelling of coals of rank higher than high volatile bituminous. Heat appears to disrupt the structure more than pyridine can; CS_2/pyridine however, relaxes the structure of Upper Freeport coal. Even strong solvents cannot swell high-rank coals more than 10% at <250 C, whereas heat treatment above 300 C and mixed solvents enhance the swellability. Origin of efficacy in swelling of a medium volatile rank coal by mixed solvents of CS_2 appears to be physical; similar bonding interactions are disrupted by this synergistic solvent action and by heat.

7121 (DOE/PC/91027–7) **Macromolecular structure analysis and effective liquefaction pretreatment. Quarterly technical progress report, 1 July 1992–30 September 1992.** Suuberg, E.M.; Yun, Y.; Lilly, W.D. Brown Univ., Providence, RI (United States). Div. of Engineering. [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91027. Order Number DE95005708. Source: OSTI; NTIS; GPO Dep.

This 7th quarterly report mainly deals with elastic properties of coal measured by Dynamic Mechanical Analysis (DMA), Differential Scanning Calorimetry (DSC), and solvent swelling, for two bituminous coals. More detailed aerial oxidation effects and sample pressing effects in DSC are also described. A transition related to coal moisture loss is more visible in DMA and solvent swelling than in DSC. Good reproducibility in DMA depends on reproducibility of forming sample pellets; small cracks was a problem.

7122 (DOE/PC/91027–8) **Macromolecular structure analysis and effective liquefaction pretreatment. Eighth quarterly technical progress report, [October–December 1992].** Suuberg, E.M. Brown Univ., Providence, RI (United States). Div. of Engineering. 11 Jun 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91027. Order Number DE95005709. Source: OSTI; NTIS; GPO Dep.

This project deals with the nature of bond cleavage and formation that occur during heating of coals under liquefaction conditions. This report summarizes the use of differential scanning calorimetry (DSC) and solvent swelling. Results are reported separately for bituminous coals and lower ranks. DSC in as-received low-rank coals were overshadowed by a large endothermic peak due to water evaporation up to 250 C. Solvent swelling indicates that crosslinking predominates >150 C; thus thermal pretreatment may not be advantageous. Solvent preswelling of some low rank coals in pyridine may offer some small advantages in terms of increase pyrolysis liquid yields. Presence of solvent during flash pyrolysis may suppress some of the crosslinking reactions.

7123 (DOE/PC/91029–T3) **Refining and end use of coal liquids. Quarterly report, April–June 1994.** Bechtel Corp., San Francisco, CA (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC91029. Order Number DE95005521. Source: OSTI; NTIS; GPO Dep.

Bechtel, with Southwest Research Institute, Amoco Oil R&D, and the M.W. Kellogg Co. as subcontractors, initialed a study on November 1, 1993, for the U.S. Department of Energy's (DOE's) Pittsburgh Energy Technology Center (PETC) to determine the most cost effective and suitable combination of existing petroleum refinery processes needed to make specification transportation fuels or blending stocks, from direct and indirect coal liquefaction product liquids. This 47-month study, with an approved budget of $4.4 million dollars, is being performed under DOE Contract Number DE-AC22-93PC91029. A key objective is to determine the most desirable ways of integrating coal liquefaction liquids into existing petroleum refineries to produce transportation fuels meeting current and future, e.g. year 2000, Clean Air Act Amendment (CAAA) standards. An intregral part of the above objectives is to test the fuels or blends produced and compare them with established ASTM fuels. The comparison will include engine tests to ascertain compliance of the fuels produced with CAAA and other applicable fuel quality and performance standards. The final part of the project includes a detailed economic evaluation of the cost of processing the coal liquids to their optimum products. The cost analyses is for the incremental processing cost; in other words, the feed is priced at zero dollars. The study reflects costs for operations using state of the art refinery technology; no capital costs for building new refineries is considered. Some modifications to the existing refinery may be required. Economy of scale dictates the minimum amount of feedstock that should be processed.

7124 (DOE/PC/91039–T11) **Highly dispersed catalysts for coal liquefaction. Quarterly report No. 12, May 23, 1994–August 22, 1994.** Hirschon, A.S.; Wilson, R.B. SRI International, Menlo Park, CA (United States). 18 Oct 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91039. Order Number DE95005768. Source: OSTI; NTIS; GPO Dep.

Objectives are to study the effect of pretreatment methods on the two- stage liquefaction process; in particular, the effects of dispersed catalysts and carbon monoxide atmospheres. This report concentrated on Tasks 1 and 2: analytical support and laboratory scale operation (Fe, Mo, Ni catalysts).

7125 (DOE/PC/91050–T8-Vol.1) **Advanced direct coal liquefaction concepts. Executive summary, Volume 1.** Berger, D.J. (Canadian Energy Development, Inc., Edmonton, AB (Canada)); Parker, R.J.; Simpson, P.L. Canadian Energy Development, Inc., Edmonton, AB (Canada); Alberta Research Council, Edmonton, AB (Canada). Jul 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91050. Order Number DE95004256. Source: OSTI; NTIS; GPO Dep.

The economics and oil yields of advanced coal liquefaction are described.

7126 (DOE/PC/91050–T8-Vol.4) **Economic feasibility study: CFR advanced direct coal liquefaction process. Volume 4.** Canadian Energy Development, Inc., Edmonton, AB (Canada); Alberta Research Council, Edmonton, AB (Canada); Kilborn Ltd., Toronto, ON (Canada). Sep 1994. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91050. Order Number DE95004258. Source: OSTI; NTIS; GPO Dep.

Preliminary technical and economic data are presented on the CFR Advanced Coal Liquefaction Process. Operating cost estimates and material balances are given.

7127 (DOE/PC/91050–T9) **Advanced direct coal liquefaction concepts. Quarterly report, April 1–June 30, 1994.** Berger, D.J. (Canadian Energy Development, Inc., Edmonton, AB

(Canada)); Parker, R.J.; Simpson, P.L. Canadian Energy Development, Inc., Edmonton, AB (Canada); Alberta Research Council, Edmonton, AB (Canada). [1994]. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC91050. Order Number DE95005560. Source: OSTI; NTIS; GPO Dep.

The experimental part of the project was completed this quarter. The technical and economic assessment of the process is in progress. Work is well advanced on the preparation of the final report and Phase 2 proposal. Two stage liquefaction of Illinois No. 6 coal was successfully accomplished using a flow-through stirred autoclave system for the first stage followed by a counterflow reactor in the second stage. With this arrangement, coal conversions in the range of 93–95% were achieved with distillable oil yields up to 51% wt on MAF coal. It is believed that higher distillable oil yields should be achievable with solvent recycle and/or more optimized operating conditions.

7128 (DOE/PC/91054–T12) **Effect of pretreating of host oil on coprocessing. Quarterly progress report, July 1–September 30, 1994.** Wender, I.; Tierney, J.W. Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. 24 Oct 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91054. Order Number DE95005189. Source: OSTI; NTIS; GPO Dep.

The principal objective of this research is to gain information on the role that host petroleum-derived oils (1,000 F+), as well as that of catalytically treated host oils, play when used as liquefaction solvents in coprocessing with coal. The host oil will be extensively characterized and then pretreated in ways which involve catalytic reactions such as hydrogenation and hydrocracking. The pretreated oils will then be characterized by elemental analysis, catalytic dehydrogenation, distillation, GC-MS, and NMR. The effect of the host oil on coprocessing with coal will be compared to that obtained using catalytically modified host oils. When appropriate, model compounds will be used to study specific reactions brought about by the pretreatments. Experimental methods, materials, and results to date are described.

7129 (DOE/PC/91055–T9) **The role of the resid solvent in coprocessing with finely divided catalysts. Quarterly report, July–September, 1994.** Curtis, C.W. Auburn Univ., AL (United States). Dept. of Chemical Engineering. [1994]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91055. Order Number DE95005176. Source: OSTI; NTIS; GPO Dep.

This progress report describes the continuation of coal-resid coprocessing reactions which have been performed during the last two quarters. During the past two quarters, Maya and FHC-623 resids were evaluated as whole resids and as the hexane soluble fractions in noncatalytic and catalytic reactions at 400 C with Pittsburgh No. 8 bituminous coal and Blind Canyon bituminous coal. During this current quarter, reactions have been performed with the saturate fraction of these resids. In order to evaluate the role of the different components in resids, the hexane fractions of the resids were separated into saturate and aromatic fractions. The saturate fraction should contain the majority of the naphthenes present in the resid. The saturate fractions were reacted with coal at the same liquefaction conditions as the whole resids and the hexane soluble fractions of the resid. In the catalytic reactions, a Mo naphthenate precursor was used in the presence of sulfur. The catalyst generate din situ was MoS_2. The effect of different reaction conditions on the resid was monitored by gas chromatography in which the retention times of the eluting peaks were determined. The amount of eluent present at different retention times was determined and compared. The effect of the resid solvent system and catalytic treatment on coal behavior during liquefaction was determined by the amount of coal conversion to THF solubles and solvent fractionation of the reaction products.

7130 (DOE/PC/91056–T7) **Molecular catalytic coal liquid conversion. Quarterly progress report.** Stock, L.M.; Yang, S. Chicago Univ., IL (United States). Dept. of Chemistry. 30 Jun 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91056. Order Number DE95005175. Source: OSTI; NTIS; GPO Dep.

Research work has concentrated on the two general tasks that were described in the original proposal. The first task concerns the development of molecular organometallic homogeneous catalysts that can be used in the hydrogenation of coal liquids. The second concerns non-metallic organic bases which can activate dihydrogen for arene hydrogenation, and that can also be used in the conversion of coal liquids. A series of organometallic compounds which were reported to exhibit good catalytic activities for the homogeneous hydrogenation of aromatic hydrocarbons have been synthesized and characterized. Current research on the second task was designed to investigate whether such basic reagents ranging from hydroxide to hydrosulfide ion and amide ion can accomplish the addition of dihydrogen to pure compounds and coal liquids and to simultaneously remove heteroatoms from them. The authors worked this quarter to study the influence of temperature, hydrogen pressure, catalyst concentration, as well as the character of the solvent on the hydrogenation of naphthalene to tetralin. The results are shown.

7131 (DOE/PC/91281–T12) **Low severity coal liquefaction promoted by cyclic olefins. Quarterly report, July–September, 1994.** Curtis, C.W. Auburn Univ., AL (United States). Dept. of Chemical Engineering. [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91281. Order Number DE95005196. Source: OSTI; NTIS; GPO Dep.

Previous research indicates that the cyclic olefin, 1,4,5,8,9,10-hexahydroanthracene (HHA), is one of the most effective hydrogen donors tested under low severity conditions. A mild acidic pretreatment of the coal prior to liquefaction has proven to be significant in increasing conversion of low rank coals under low severity conditions as well. Coal conversion can also be improved by employing hydrotreating catalysts. In this study, reactions with coal mild acidic pretreatment were performed with cyclic olefins with and without catalysts. These reactions provided the data to prove whether catalysts are effective under low severity conditions. Evaluating the effect of these three factors (mild acidic pretreatment, hydrogen donation by cyclic olefins, and the use of slurry phase catalysts) on the reactivity of low severity coal liquefaction was the basis of this study. By examining the results, it is clear that the combination of all of the most favorable factors produced coal conversions of more than 50%. The effectiveness of HHA was tested by performing reactions without a cyclic olefin which produced substantially lower coal conversion, thus proving how effective hydrogen donation by cyclic olefins is in low severity coal liquefaction. The mild acidic pretreatment demonstrated its effectiveness on increasing the conversion low rank coals. By promoting higher conversion for the lignite than for the subbituminous coal, suggested that the lower the rank is, the better mild acidic pretreatment works. The catalyst MoNaph proved its effectiveness in low severity coal liquefaction, too, although the reactions with the other slurry phase catalysts NiOct was not effective. Also, synergy among the mild acid pretreatment, HHA and MoNaph occurred yielding high coal conversions for both coals.

7132 (DOE/PC/91288–T14) **High temperature electrochemical separation of H_2S from coal gasification process streams. Quarterly progress report, July 1, 1994–September 30, 1994.** Winnick, J. Georgia Inst. of Tech., Atlanta, GA (United States). School of Chemical Engineering. [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91288. Order Number DE95005770. Source: OSTI; NTIS; GPO Dep.

A method of polishing coal synthesis gas by an electrochemical membrane operation is being perfected. The operation takes advantage of an electrochemical potential gradient rather than conventional techniques, separating the H_2S from the coal gas stream, leaving only H_2 to enrich the exiting fuel gases. Sulfur is the by-product that is carried away by a separate inert sweep gas and condensed downstream. The technology is attractive due to simplicity as well as economics when compared to alternatives. Experimental analysis was not possible this quarter due to a change of laboratories. This change makes possible improved experimental conditions. Predominant work dealt with improving the current process, improving the oven structure to accommodate a controlled

atmosphere heating, regulating oven conditions using resistance control, etc.

7133 (DOE/PC/91311–T12) **Configurational diffusion of asphaltenes in fresh and aged catalyst extrudates. Quarterly progress report, 20 June 1994–20 September 1994.** Guin, J.A. Auburn Univ., AL (United States). Dept. of Chemical Engineering. [1994]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91311. Order Number DE95005184. Source: OSTI; NTIS; GPO Dep.

Asphaltenes are a complex multi-component diffusion system, and thus to obtain a better understanding of such a complex system, the author developed a mathematical adsorption-diffusion simulation model for multi-component systems. A numerical method was developed for the solution of the mathematical model. The model developed for the multi-component system is an extension of the work performed during the past year concerning adsorptive-diffusion systems. The effects of model parameters on the model solution were studied theoretically. It was found that the uptake rate of a component was not only dependent on the diffusion rate, but also on the adsorption capacity and molecule size. The interaction between diffusion rate, adsorption capacity and molecule size may result in crossover(s) for uptake rate of one component with other components during the adsorption-diffusion process. Next quarter uptake experiments using asphaltenes will be performed. A simplified mathematical diffusion model for complicated mixtures such as asphaltenes will be developed and numerically solved. The diffusion behavior of asphaltenes in catalyst pores will be studied by fitting the experimental data with the diffusion model.

7134 (DOE/PC/92147–7) **Catalytic multi-stage liquefaction of coal. Seventh quarterly report-final, April 1, 1994–June 30, 1994.** Comolli, A.G.; Johanson, E.S.; Lee, L.K.; Pradhan, V.R.; Stalzer, R.H. Hydrocarbon Research, Inc., Princeton, NJ (United States). Jul 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC92147. Order Number DE95005205. Source: OSTI; NTIS; GPO Dep.

The overall objective of this program is to produce liquid fuels from coal by direct liquefaction at a cost that is competitive with conventional fuels. Specifically, this continuous bench-scale program contains provisions to examine new ideas in areas such as: low temperature pretreatments, more effective catalysts, on-line hydrotreating, new coal feedstocks, other hydrogen sources, more concentrated coal feeds and other highly responsive process improvements while assessing the design and economics of the bench-scale results. This quarterly report covers work on Laboratory Scale Studies, Continuous Bench-Scale Operations, Technical Assessment and Project Management.

7135 (DOE/PC/92246–T6) **Development of enhanced sulfur rejection processes. Final technical progress report, fifth quarter, October 1–December 31, 1993.** Yoon, R.H.; Luttrell, G.; Adel, G.; Richardson, P.E. Virginia Center for Coal and Minerals Processing, Blacksburg, VA (United States). Oct 1994. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92246. Order Number DE95005181. Source: OSTI; NTIS; GPO Dep.

Two complementary concepts for improving the removal of inorganic sulfur from many eastern US coals are the Electrochemically Enhanced Sulfur Rejection (EESR) and Polymer Enhanced Sulfur Rejection (PESR). The EESR process uses electrochemical techniques to suppress the formation of hydrophobic oxidation products believed to be responsible for the floatability of coal pyrite. The PESR process uses polymeric reagents that react with pyrite and convert floatable middlings (composite particles composed of pyrite with coal inclusions) into hydrophilic particles. It is believed that these processes can be used simultaneously to maximize the rejection of both well-liberated pyrite and composite coal-pyrite particles. During the current reporting period, work was conducted in the following areas: studies of the liberation characteristics of various pyrite samples, identification of oxidation products on pyrite using XPS technique, studies of reagent adsorption on pyrite using FTIR and contact angles, identification of the most effective sacrificial anode material for depressing pyrite, and identification of the most effective polymer for depressing pyrite. Some of the more significant findings made during the current reporting periods are as follows: (1) liberation characteristics of Illinois No. 6 coal have been determined, (2) effects of pH and electrochemical potentials on the flotation of coal and mineral pyrite have been established, (3) an effective method of keeping coal pyrite under reducing conditions and, hence, preventing self-induced flotation has been developed, and (4) an effective polymeric pyrite depressant has been identified.

7136 (DOE/PC/92527–T8) **Hindered diffusion of coal liquids. Quarterly report No. 8, June 18, 1994–September 17, 1994.** Tsotsis, T.T. (University of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering); Sahimi, M.; Webster, I.A. University of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering. [1994]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92527. Order Number DE95006205. Source: OSTI; NTIS; GPO Dep.

Experiments on transport of coal- and petroleum-derived asphaltenes using catalytic membranes were continued. Results did not agree with published data. Aggregations/delamination phenomena of asphaltenes in resins and in solution were studied. Extensive Monte Carlo calculations were carried out of the adsorption of large aggregates and molecules both in a single pore and in a porous medium consisting of a large number of pores. Diffusion coefficients were very sensitive to pore space characteristics.

7137 (DOE/PC/92550–8) **Evaluation of hyperbaric filtration for fine coal dewatering. Eighth quarterly technical progress report, July 1, 1994–September 30, 1994.** Parekh, B.K. (Univ. of Kentucky, Lexington, KY (United States)); Leonard, J.W.; Hogg, R.; Fonseca, A. Kentucky Univ., Lexington, KY (United States). Research Foundation. [1995]. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92550. Order Number DE95005201. Source: OSTI; NTIS; GPO Dep.

Most of the coal presently used by the utility industry is cleaned at preparation plants employing wet processes. Water, while being the mainstay of coal washing, is also one of the least desirable components in the final product. Coarse coal (+3/4 inch) is easily dewatered to a 3-4 percent moisture level using conventional vibrating screens and centrifuges. However, the main problem of excess product moisture occurs in fine (minus 28 mesh) coal and refuse. Even though fines may constitute only about 20 percent of a contemporary cleaning plant feed, they account for two-thirds of the product surface moisture. This high surface moisture offsets many of the benefits of coal cleaning, and can easily undercut the ongoing programs on recovery of fine clean from refuse as well as producing an ultra-fine super clean coal fuel. Currently, most of the coal preparation plants utilize vacuum disk or drum filter technology for dewatering of the fine coal, providing dewatered product containing about 25 percent moisture. The coal industry would prefer to have a product moisture in the range of 10 to 15 percent. Although the desired product quality can be obtained using thermal dryer, there are problems associated with this technology such as high capital costs and a source of air pollution. In the present research project, an alternative to thermal drying, hyperbaric filtration which has shown potential in lowering moisture content in fine coal to less than 20 percent level, is being investigated in detail. The project will develop fundamental information on particle-liquid interaction during hyperbaric filtration and apply the knowledge in developing optimum conditions for the pilot plant testing of the hyperbaric filter system.

7138 (DOE/PC/93054–4) **A characterization and evaluation of coal liquefaction process streams. Quarterly technical progress report, June 29–September 30, 1994.** Robbins, G.A.; Brandes, S.D.; Winschel, R.A.; Burke, F.P. CONSOL, Inc., Library, PA (United States). Oct 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-94PC93054. Order Number DE95005173. Source: OSTI; NTIS; GPO Dep.

The objectives of this project are to support the DOE direct coal liquefaction process development program and to improve the interaction between direct coal liquefaction process development and analytical chemistry. Independent analyses of well-established methods will be obtained of samples produced in direct coal liquefaction processes under evaluation by DOE. Additionally, analytical instruments and techniques which are currently underutilized for

the purpose of examining coal-derived samples will be evaluated. The data obtained from this study will be used to help guide current process development and to develop an improved data base on coal and coal liquids properties. A sample bank will be established and maintained for use in this project and will be available for use by other researchers. The reactivity of the non-distillable resids toward hydrocracking at liquefaction conditions (i.e., resid reactivity) will be examined. From the literature and data experimentally obtained, a mathematical kinetic model of resid conversion will be constructed. It is anticipated that such a model will provide insights useful for improving process performance and thus the economics of direct coal liquefaction. Progress during the first quarter of the contract period is described.

7139 (DOE/PC/94207–T1) **High temperature electrochemical polishing of H_2S from coal gasification process streams. Quarterly progress report, August 1, 1994–September 30, 1994.** Winnick, J. Georgia Inst. of Tech., Atlanta, GA (United States). School of Chemical Engineering. [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94207. Order Number DE95006242. Source: OSTI; NTIS; GPO Dep.

A high temperature electrochemical cell capable of polishing hydrogen sulfide from fuel gas streams is being perfected. The operation, to be used in compliance with high efficiency energy conversion systems, takes advantage of an electrochemical potential gradient instead of typical separation techniques to separate hydrogen sulfide from the fuel gas stream leaving hydrogen to enrich the exiting gases. Vaporoussulfur is the by-product carried downstream by a separate inert sweep gas and condensed. The Electrochemical Membrane Separator (EMS), the focus of experimental work, purges a fuel gas contaminated with H_2S. This is done by reducing the most electro-active species in the gas stream. In this case, H_2S is reduced by the following: $H_2S + 2e^- \rightarrow H_2 + S^{2-}$. A membrane which contains sulfide ions in a molten salt electrolyte will act to transport the ions across to the anode. If the membrane is impermeable to H_2 diffusion from the cathode side, an inert sweep gas can be used to carry the vaporous oxidized sulfur downstream to be condensed. Work began this quarter to improve experimental conditions (laboratory & equipment enhancement). The oven containing the (EMS) is the main focus of improvement readjusting spatial requirements conforming to the controlled environmental emissions equipment while creating a controlled atmosphere gauntlet to unfavorable reactions with electrolytic species.

7140 (FAAR–23/1993, pp. 87-91) **Aerosol particle characteristics from pressurised fluidised bed coal gasification.** Lind, T. (Technical Research Centre of Finland, Espoo (Finland). Aerosol Technology Group); Kauppinen, E.I.; Jokiniemi, J.K.; Kurkela, E.; Pakkanen, T.; Berner, A. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

A method was developed to sample aerosol particles from the pressurised fluidised bed gasification (PFG) product gas in process conditions up to 1.0 MPa and 700 deg C. The aerosol pressure and temperature were kept constant in order to avoid aerosol transformations during sampling. The experiments were conducted in Otaniemi PDU-scale PFG test facility operated at 0.5 MPa. Three different coals were gasified during the experiments. Limestone was used as sorbent material in experiments with two of the coals. The results indicate, that the mass size distributions of the aerosol particles formed in coal PFG consist of at least two modes in the size range D_p = 0.6-10 μm, one at about 5 μm, the other one in the sub micron size range. The calcium and potassium contents of high temperature impactor (HTI) collected samples were analysed for dilute HNO_3 soluble fractions with GFAAS. The calcium content of the aerosol particles was almost size independent in the particles smaller than 10 μm, whereas potassium showed enrichment in small particles.

7141 (FAAR–23/1993, pp. 119-124) **Moving granular bed filter research at Delft University of Technology.** Nykaenen, J. (Imatran Voima Oy, Vantaa (Finland). Air Pollution Control Group); Zevenhoven, C.A.P.; Andries, J.; Hein, K.R.G. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

The granular bed filter research at Delft University of Technology (DUT) was started in 1987. The main task of the current work is to determine the effect of changes in the combustion process on particle removal efficiency of the Moving Granular Bed Filter (MGBF). The efficiency of the filter is determined while burning subbituminous or bituminous coals, or coal together with biomass. One goal is to study the particle removal rate while burning with recirculated carbon dioxide and oxygen instead of air. To find out the effect of partial gasification, CO_2O_2 combustion is carried out also at substoichiometric conditions. In addition, the project includes the comparison of the removal efficiencies of a ceramic filter and MGBF. And finally, the alkali concentrations before and after both particle removal equipments are measured. First tests with the MGBF at high temperature and high pressure show that there are still problems in operating MGBF continuously in PFBC-conditions. The efficiency was reduced by re-entrained agglomerates and the cleaning Or granules included some difficulties. Nevertheless, it was shown that MGBF allows for operation at constant pressure drop.

7142 (KE–93003G) **A study on the briquetting by improving the carbonization.** Son, E.K. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Lee, S.H.; Park, J.S.; Lim, Y.J. No corporate text available. Dec 1993. 102p. (In Korean). Order Number DE95744271. Source: OSTI; NTIS (US Sales Only).

The molten caustic leaching(MCL) process using NaOH as leachant was tested in order to improve the quality of Korean anthracite. The properties of Korean anthracite were changed significantly after treatment with MCL except for the graphitic coal. (author). refs., figs., tabs.

7143 (DOE/MT/92019–T2) **Effect of coal beneficiation process on rheology/atomization of coal water slurries. Quarterly progress report, August 1–October 31, 1994.** Ohene, F. Grambling State Univ., LA (United States). Dept. of Chemistry. [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92MT92019. Order Number DE95005193. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to perform experiments to understand the effect of coal beneficiation processes and high shear rheological properties on the atomization of coal-water slurries (CWS). In the atomization studies, the mean drop size of the CWS sprays will bed determined at various air-to-CWS ratios. A correlation between the high shear rheological properties, particle size distributions and the atomization will be made in order to determine the influence of these parameters on the atomization of CWS. During this past quarter, experimental studies on pressure dependent atomization of coal-water slurries and simulated fluids were continued. Surface tension, oscillatory, high and low shear flow behavior of the slurries were also performed.

7144 (DOE/PC/90287–T15) **Further studies of the effects of oxidation on the surface properties of coal and coal pyrite.** Herrera, M.N. California Univ., Berkeley, CA (United States). 1994. 239p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90287. Order Number DE95006248. Source: OSTI; NTIS; GPO Dep.

The objective of this research was to investigate the oxidation behavior of coal and coal pyrite and to correlate the changes in the surface properties induced by oxidation, along with the intrinsic physical and chemical properties of these organic and inorganic materials, with the behavior in physical coal cleaning processes. This provide more fundamental knowledge for understanding the way in which different factors interact in a medium as heterogeneous as coal. Fourteen coal samples of different ranks ranging from high to medium sulfur content were studied by dry oxidation tests at different temperatures and humidities, and by wet oxidation

tests using different oxidizing agents. The concentration of surface oxygen functional groups was determined by ion-exchange methods. The changes in the coal composition with oxidation were analyzed by spectroscopic techniques. The wettability of as-received and oxidized coal and coal pyrite samples was assessed by film flotation tests. The electrokinetic behavior of different coals and coal pyrite samples was studied by electrokinetic tests using electrophoresis. Possible oxidation mechanisms have been proposed to explain the changes on the coal surface induced by different oxidation treatments.

7145 (DOE/PC/91303–T13) **Semiconductor / electrochemistry of coal pyrite. Technical progress report, July–September, 1994.** Osseo-Asare, K.; Wei, D. Pennsylvania State Univ., University Park, PA (United States). Dept. of Materials Science and Engineering. Oct 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91303. Order Number DE95005182. Source: OSTI; NTIS; GPO Dep.

This project seeks to advance the fundamental understanding of the physicochemical processes occurring at the pyrite/aqueous interface, in the context of coal cleaning, coal desulfurization, and acid mine drainage. Pyrite particles were synthesized by aqueous precipitation and purified by means of solvent extraction to remove elemental sulfur. A purified pyrite sample containing 98.35% FeS_2 was obtained and used in photoelectrochemical experiments. Illumination of pyrite microelectrodes increased both the anodic current and the dissolution rate dramatically, but it had little effect on the cathodic current and the cathodic dissolution. These results indicate that pyrite, as an n-type semiconductor, dissolves anodically through a hole transfer pathway, while cathodic dissolution involves only electron reaction.

7146 (DOE/PC/92251–T7) **Refining of fossil resin flotation concentrate from western coal. Seventh quarter final report, July 1, 1994–September 30, 1994.** Jensen, G.F.; Miller, J.D. Utah Univ., Salt Lake City, UT (United States). 20 Oct 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC92251. Order Number DE95006240. Source: OSTI; NTIS; GPO Dep.

The following equipment was purchased/fabricated to assemble the capacity of the resin-refining circuit: AccuRate dry material screw feeder, air operated feed pumps, solvent extractor, plastic tubings and fittings, unistrut fittings and valves, and nitrogen heater. Some equipment was tested and refining begun.

7147 (DOE/PC/93202–4) **Molecular accessibility in oxidized and dried coals. Quarterly report.** Kispert, L.D. Alabama Univ., University, AL (United States). Dept. of Chemistry. Sep 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93202. Order Number DE95005200. Source: OSTI; NTIS; GPO Dep.

The objective of this research project is to determine the molecular and structural changes that occur in swelled coal as a result of oxidation and moisture loss both in the presence and absence of light using the newly developed EPR spin probe method. The proposed study will make it possible to deduce the molecular accessibility distribution in swelled, oxidized APCS coal for each rank as a function of (1) size (up to 6 nm) and shape, (2) the relative acidic/basic reactive site distributions, and (3) the role of hydrogen bonding as a function of swelling solvents. The advantage of the EPR method is that it permits molecules of selected shape, size and chemical reactivity to be used as probes of molecular accessible regions of swelled coal. From such data an optimum catalyst can be designed to convert oxidized coal into a more convenient form and methods can be devised to lessen the detrimental weathering processes. The observed data for the APCS coals studied to date can be explained in terms of four different processes: one, disruption of weak hydrogen bonds which protect or isolate the interconnected micropore system; two, disruption of weak hydrogen bonds which protect individual micropores; three, the competition of pyridine for the active sites capable of establishing hydrogen bonds or the poisoning of active sites; four, disruption of stronger hydrogen bonds within the macromolecular structure which cause an opening of the structure. The contributions of each of these factors to the spin probe retention with increasing concentrations of pyridine varying up to 5% pyridine are examined. At concentrations above 5% pyridine, the first factor becomes less significant, and variations in the others require greater changes in pyridine concentration.

7148 (DOE/PC/93223–T3) **Surface properties of photo-oxidized bituminous coals. Technical progress report, July–September, 1994.** Mitchell, G.; Zhang, E.; Subbarayan, S.; Davis, A.; Chander, S. Pennsylvania State Univ., University Park, PA (United States). Coal and Organic Petrology Labs. Nov 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93223. Order Number DE95005174. Source: OSTI; NTIS; GPO Dep.

Sample preparation on the coal samples collected during the last report period was slowed so that the authors could take advantage of some analytical opportunities. During this report period, sixteen solid-phase aromatic compounds were evaluated using the fluorometric techniques. In addition, samples of the Pittsburgh seam coal (DECS-23) were prepared and photo-oxidized in blue light for evaluation by Secondary Ion Mass Spectrometry (SIMS) at the University of New South Wales and by Scanning Transmission X-ray Microscopy (STXM) at Brookhaven National Laboratory. These analytical procedures should contribute to the understanding of the chemistry of fluorescence emission and its role in the photo-oxidation of coal (vitrinite) surfaces. Although results from the two outside laboratories are not available for the current report, the preliminary study of aromatic model compounds has been completed. Compared with vitrinite, fluorescence emissions from most of the model compounds were considerably higher. The reason for this was found in the evaluation of compounds with different numbers of condensed aromatic rings and molecular configuration, as well as the type and location with the molecule of heteroatoms and substituents. However, of most importance to this study was the observation that compounds containing carbonyl and carboxylic acid groups possessed relatively high fluorescence emissions and gave positive or dual alteration patterns in response to photo-oxidation. This observation has similarities to results obtained from low-rank and naturally weathered coals which also contain these functional groups.

7149 (DOE/PC/94214–T1) **Organosulphur compounds in coals as determined by reaction with Raney nickel and microscale pyrolysis techniques. First quarterly report, July 1, 1994–September 30, 1994.** Philp, R.P. Oklahoma Univ., Norman, OK (United States). School of Geology and Geophysics. [1994]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94214. Order Number DE95006241. Source: OSTI; NTIS; GPO Dep.

This project is designed to study the nature of sulphur-containing organic compounds and their respective linkages in coals and related materials using a variety of microscale pyrolysis techniques combined with gas chromatography, gas chromatography – mass spectrometry, and gas chromatography – mass spectrometry/mass spectrometry. The majority of the work will be undertaken using a PYRAN pyrolysis system purchased with funds from the DOE University Instrumentation Program. Although significant studies in the past have examined hydrocarbons produced from the pyrolysis of coals, little attention has been directed at studying the heteroatomic components produced in this way. With the use of carefully controlled temperature-programmed pyrolysis reactions it should be possible to obtain information on the relative bond energies of the C-S and S-S bonds being cleaved during coal pyrolysis and to provide a better understanding on the nature of the sulphur bonding in coals. In the experiments performed with Raney nickel and coal, the results showed that while Raney nickel was indeed and excellent degrader of organic sulphur compounds in oils and coal extracts, the recovery from a high sulphur Oklahoman coal was negligible. Following the realization that Raney nickel is of little use in cleaving organosulphur compounds from coals, a new literature review was initiated to determine which possible sulphur chemical degradation method would be an appropriate replacement. After careful consideration of the various possible methods, it would appear that the procedure which will work on solid phases (i.e., coal), will give similar results to the Raney nickel method, and which we may be able to perform here with the least level of expenditure on

new equipment, is the use of nickel(O)cene (bis[1,5-cyclopentadiene]nickel(O)) with lithium aluminum hydride ($LiAlH_4$).

7150 (FAAR–23/1993, pp. 125-130) **Electrostatic precipitator penetration function for pulverised coal combustion aerosols at different boiler loadings.** Ylaetalo, S.I. (Technical Research Centre of Finland, Espoo (Finland). Aerosol Technology Group); Kauppinen, E.I.; Joutsensaari, J.; Jokiniemi, J.K.; Hautanen, J. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

The penetration of fly ash particles through the electrostatic precipitator (ESP) was measured as a function of particle diameter in the size range of 0.02-0.7 μm at a 300 MW boiler during different operating conditions for combustion and electrostatic precipitation by differential mobility analysers (DMA) and condensation nucleus counters (CNC). Gas composition (O_2, CO_2, CO, NO_x and SO_2) and ESP operating voltages and currents were recorded. Measured mobility distributions were inverted to the desired number size distributions by a commercial TSI-algorithm. Fractional penetration functions were calculated as the ratio of number size distributions before and after the ESP, respectively. Penetration functions appeared to depend on the boiler load, ESP voltages and the operation of coal mill. Highest penetration was achieved with the highest boiler load. Bimodal structure of the penetration function was detected when the last section of ESP was mall functioning or turned off. (orig.)

This report presents the results of a three-year program of field testing at an Fluidized-bed combustion (FBC) waste disposal site constructed in western Colorado with the cooperation of the Tri-State Generation and Transmission Association's Nucla power station. Data were collected to characterize: (1) the wastes; (2) the envirorunents in which they were disposed of; and (3) the leaching, migration, and attenuation of regulated or potentially regulated constituents. Data gathered during this study will serve as the basis for an engineering design manual to guide future disposal facility development.

7152 (DOE/MC/26288–3961) **Sonic enhanced ash agglomeration and sulfur capture. Technical progress report, July 1994–September 1994.** Manufacturing and Technology Conversion International, Inc., Santa Fe Springs, CA (United States). [1994]. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26288. Order Number DE95006092. Source: OSTI; NTIS; GPO Dep.

A major concern with the utilization of coal in directly fired gas turbines is the control of particulate emissions and reduction of sulfur dioxide, and alkali vapor from combustion of coal, upstream of the gas turbine. Much research and development has been sponsored on methods for particulate emissions control and the direct injection of calcium-based sorbents to reduce SO_2 emission levels. The results of this research and development indicate that both acoustic agglomeration of particulates and direct injection of sorbents have the potential to become a significant emissions control strategy.

7153 (DOE/MC/30252–3945) **Management of dry flue gas desulfurization by-products in underground mines. Annual report, October 1993–September 1994.** Chugh, Y.P.; Dutta, D.; Esling, S.; Ghafoori, N.; Paul, B.; Sevim, H.; Thomasson, E. Southern Illinois Univ., Carbondale, IL (United States). Dept. of Mining Engineering. Oct 1994. 138p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-93MC30252. Order Number DE95000035. Source: OSTI; NTIS; GPO Dep.

Preliminary environmental risk assessment on the FGD by-products to be placed underground is virtually complete. The initial mixes for pneumatic and hydraulic placement have been selected and are being subject to TCLP, ASTM, and modified SLP shake tests as well as ASTM column leaching. Results of these analyses show that the individual coal combustion residues, and the residues mixes, are non-hazardous in character. Based on available information, including well logs obtained from Peabody Coal Company, a detailed study of the geology of the placement site was completed. The study shows that the disposal site in the abandoned underground mine workings at depths of between 325 and 375 feet are well below potable groundwater resources. This, coupled with the benign nature of the residues and residues mixtures, should alleviate any concern that the underground placement will have adverse effects on groundwater resources. Seven convergence stations were installed in the proposed underground placement area of the Peabody Coal Company No. 10 mine. Several sets of convergence data were obtained from the stations. A study of materials handling and transportation of coal combustion residues from the electric power plant to the injection site has been made. The study evaluated the economics of the transportation of coal combustion residues by pneumatic trucks, by pressure differential rail cars, and by SEEC, Inc. collapsible intermodal containers (CICs) for different annual handling rates and transport distances. The preliminary physico-chemical characteristics and engineering properties of various FBC fly ash-spent bed mixes have been determined, and long-term studies of these properties are continuing.

7154 (DOE/MT/92018–8) **Investigation of combined SO_2/NO_x removal by Ceria sorbents. Quarterly technical progress report, July 1994–September 1994.** Akyurtlu, A. Hampton Univ., VA (United States). Dept. of Engineering. Oct 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92MT92018. Order Number DE95005374. Source: OSTI; NTIS; GPO Dep.

Simultaneous removal of SO_2 and NO_x using a regenerable solid sorbent will constitute an important improvement over the use of separate processes for the removal of these two pollutants from stack gases and possibly eliminate several shortcomings of the individual SO_2 and NO_xremoval operations. This process will allow simple and reliable cleanup of large volumes of stack gases at a competitive cost; produce a concentrated stream of SO_2 which an easily be converted into valuable by-products; be compatible with existing power generation plants; and essentially eliminate the waste materials generated in some other sulfur removal processes. Recent studies at PETC considered cerium oxide as an alternate sorbent to CuO. Ceria improves the resistance of the alumina support to thermal sintering and produces a regeneration off-gas stream that can be easily converted to elemental sulfur. It has a potentially higher sulfur capture capacity than copper. It is readily available at a moderate cost. Although it is more expensive than copper oxide, since the cost of metal oxide is a small fraction of the total sorbent cost this may not be a significant factor. The objective of this research is to determine the effects of ammonia on the sulfation of the sorbent; to determine the effects of fly ash on the sulfation and regeneration of the sorbent; to obtain a rate expression for the regeneration of alumina-supported CeO_2 sorbents; to model reactor configurations for a commercial scale combined CeO_2/Al_2O_3 sorbent; and to study alternative designs, effects of design variables on the performance of the facility, and the economics of the process using the developed model.

7155 (DOE/PC/90096–T7) **Microbial reduction of SO_2 and NO_x as a means of by-product recovery/disposal from regenerable processes for the desulfurization of flue gas. Technical progress report, September 11, 1992–December 11, 1992.** Sublette, K.L. Tulsa Univ., OK (United States). Center for Environmental Research and Technology. [1992]. 250p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90096. Order Number DE94012353. Source: OSTI; NTIS; GPO Dep.

With the continual increase in the utilization of high sulfur and high nitrogen containing fossil fuels, the release of airborne pollutants into the environment has become a critical problem. The fuel sulfur is converted to SO_2 during combustion. Fuel nitrogen and a fraction of the nitrogen from the combustion air are converted to nitric oxide and nitrogen dioxide, NO_x. For the past five years Combustion Engineering (now Asea Brown Boveri or ABB) and, since 1986, the University of Tulsa (TU) have been investigating the oxidation of H_2S by the facultatively anaerobic and autotrophic bacterium Thiobacillus denitrificans and have developed a process, concept for the microbial removal of H_2S from a gas stream the simultaneous removal of SO_2 and NO by D. desulfuricans and T. denitrificans co-cultures and cultures-in-series was demonstrated. These systems could not be sustained due to NO inhibition of D. desulfuricans. However, a preliminary economic analysis has shown that microbial reduction of SO_2 to H_2S with subsequent conversion to elemental sulfur by the Claus process is both technically and economically feasible if a less expensive carbon and/or energy source can be found. It has also been demonstrated that T. denitrificans can be grown anaerobically on NO(g) as a terminal electron acceptor with reduction to elemental nitrogen. Microbial reduction of NO_x is a viable process concept for the disposal of concentrated streams of NO_x as may be produced by certain regenerable processes for the removal of SO_2 and NO_x from flue gas.

7156 (DOE/PC/90365–T16) **Fundamental mechanisms in flue gas conditioning. Quarterly report, July 1994–September 1994.** Snyder, T.R. Southern Research Inst., Birmingham, AL (United States). 15 Oct 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90365. Order Number DE95005766. Source: OSTI; NTIS; GPO Dep.

This project is divided into four tasks. We developed our Management Plan in Task 1 . Task 2, Evaluation of Mechanisms in FGD Sorbent and Ash Interactions, focuses on characteristics of binary mixtures of these distinct powders. Task 3, Evaluation of Mechanisms in Conditioning Agents and Ash, is designed to examine effects of various conditioning agents on fine ash particles to determine mechanisms by which these agents alter physical properties of ash. We began Tasks 2 and 3 with an extensive literature search and assembly of existing theories. We completed this phase of the project with publication of two special Topical Reports. During the past several quarters we performed our analyses of the samples in our database. Pilot-scale evaluations have begun and will continue during the next two quarters. We will include the results of laboratory and pilot-scale work performed under Tasks 2 and 3 in a Flue Gas Conditioning Model that we will issue under Task 4. The Final Report for the project will also be prepared under Task 4. In our literature reviews reported in Topical Reports 1 and 2, we emphasized the roles adsorbed water can have in controlling bulk properties of powders. The experiments we performed were primarily designed to define the extent to which water affects key properties of ashes, powders, and mixtures of sorbents and ashes. We are currently performing a series of pilot-scale tests designed to determine the effects that adsorbed water has on fabric filtration and electrostatic precipitation of entrained fly ash particles in actual flue gas environments.

7157 (DOE/PC/90548–T14) **LIFAC Sorbent Injection Desulfurization Demonstration Project. Quarterly report No. 15, April–June 1994.** LIFAC North America, Inc., Oakland, CA (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-91PC90548. Order Number DE95005522. Source: OSTI; NTIS; GPO Dep.

In December 1989, the U.S. Department of Energy selected 13 projects for funding under the Federal Clean Coal Technology Program (Round III). One of the projects selected was the project sponsored by LIFAC North America, (LIFAC NA), titled "LIFAC Sorbent Injection Desulfurization Demonstration Project". The host site for this $22 million, three-phase project is Richmond Power and Light's Whitewater Valley Unit No. 2 in Richmond, Indiana. The LIFAC technology uses upper-furnace limestone injection with patented humidification of the flue gas to remove 75-85% of the sulfur dioxide (SO_2) in the flue gas. In November 1990, after a ten (10) month negotiation period, LIFAC NA and the U.S. DOE entered into a Cooperative Agreement for the design, construction, and demonstration of the LIFAC system. This report is the fifteenth Technical Progress Report covering the period April 1, 1994 through the end of June 1994. Due to the power plant's planned outage in March 1991, and the time needed for engineering, design and procurement of critical equipment, DOE and LIFAC NA agreed to execute the Design Phase of the project in August 1990, with DOE funding contingent upon final signing of the Cooperative Agreement.

This report is the sixteenth Technical Progress Report covering the period July 1, 1994 through the end of September 1994. Due to the power plant's planned outage in March 1991, and the time needed for engineering, design and procurement of critical equipment, DOE and LIFAC NA agreed to execute the Design Phase of the project in August 1990, with DOE funding contingent upon final signing of the Cooperative Agreement.

7159 (DOE/PC/93256–T4) **Electric Power Research Institute: Environmental Control Technology report to the Steering Committee, July 1994. [Monthly report].** Electric Power Research Inst., Palo Alto, CA (United States). [1994]. 70p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract FG22-94PC93256. Order Number DE95005562. Source: OSTI; NTIS; GPO Dep.

Operations and maintenance continued this month at the Electric Power Research Institute's Environmental Control Technology Center. Testing on the 4.0 MW Pilot Wet FGD unit continued this month with the completion of the Tampa Electric Company (TECo) Tailored Collaboration project and resumption of the High Velocity Scrubbing test block. Additional testing in Phase II of the Toxics Removal/Carbon Injection test block was conducted concurrently with the Pilot FGD testing. On the Cold-Side Selective Catalytic Reduction (SCR) unit, testing continued this month as ammonia slip measurements were conducted at baseline conditions. A layer of catalyst material was removed from one side of the unit this month; it will be replaced with a new catalyst layer during a scheduled outage period in September.

7161 (PINSTECH-RIAD–136) **Isotopic and chemical characterization of coal in Pakistan.** Qureshi, R.M. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Radiation and Isotope Application Div.); Hasany, S.M.; Javed, T.; Sajjad, M.I.; Shah, Z.; Rehman, H. Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Radiation and Isotope Application Div. Nov 1993. 23p. Order Number DE95615651. Source: OSTI; NTIS (US Sales Only); INIS.

Stable carbon isotope ratios (delta^{13}C PDB) and toxic/trace element concentration levels are determined for Tertiary coal samples collected from seven coal fields in Pakistan. No systematic isotope effects are found in the process of coal liquefaction from peat to Tertiary lignites and sub bituminous coal. Similarly, no age effects are observed during the Tertiary regime. The observed variations in the carbon isotopic composition of coal obtained from 'Sharigh coal field' and the 'Sor-Range/Degari coal field' in Baluchistan are attributed to the depositional environments. More sampling of stable carbon isotope analysis are required to validate these observations. Significant concentrations of toxic elements such as S, Cr, Cd and Pb in Makarwal coal may pose environmental and engineering/operational problems for thermal power plants. (author).

7162 (ETDE-DE–5) **Joint-project transport control system. Sub-project: Set-up of a material flow control with integration into the district control center's infrastructure. Final report.** Hagen, G.; Melzer, H. Ruhrkohle AG, Essen (Germany). Sep 1994. 104p. Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326645H. Order Number DE95738150. Source: OSTI; NTIS (US Sales Only).

Within the project, a transport control system was developed. The system was to monitor by 100% the material transport in the underground workings, and assure computer-controlled transport, for optimising transport management, for monitoring the rolling stock in terms of state and availability, and for allowing state-oriented maintenance of the rolling stock. For vehicle-position monitoring, a stationary laser scanner was developed. The almost 100% position monitoring is the basis for comprehensive and correct information flow and for computer-based transport management, also developed within the project. An absolutely necessary component of the transport control system is the newly developed voice and data radio communication allowing rapid data transmission as well as transport-relevant information transmission directly and to the correct adress from the control center. A machine-health monitoring system (diagnostics) monitors diesel-powered rolling stock during travel, and supports maintenance by allowing computer-based machine-health diagnostics to the maintenance staff. The concept also provides for a data exchange with the maintenance planning system allowing change-over from the periodicel preventive maintenance and repair planning to need-oriented maintenance. (orig.)

7163 (ETDE-DE–6) **Automation in mining - sensor for position monitoring. Mining requirements, machine integration, testing. Final report.** Dahlhaus, N. Ruhrkohle Bergbau AG, Herne (Germany). Aug 1994. 68p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0328901E. Order Number DE95738700. Source: OSTI; NTIS (US Sales Only).

For further development and automation of mining machinery and equipment it is necessary in many cases to have information on the position of a machine or a part of a machine relative to its surroundings or relative to the north. In the joint project 'Sensor for Position Monitoring' two-axial and three-axial position identification systems of different measuring exactitude were developed. The sensor may be, for various application cases, the bases for cost-effective automation. This work in view of fielding needs to be taken on in the near future by the mine operators and the suppliers of mining equipment. (orig.)

7164 (ETDE-DE–7) **Development and testing of new methods for prevention and suppression of spontaneous combustion fires in coal mining. Final report.** Guntau, A.; Hein, N. Ruhrkohle AG, Herne (Germany). Sep 1994. 78p. Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 01HD018. Order Number DE95738149. Source: OSTI; NTIS (US Sales Only).

Spontaneous combustion in coal mining always used to be a risk to the underground crews and to profitability. There is not full understanding yet of the physico-chemical interactions resulting in spontaneous combustion of coal so that for the field, reliable forecasts cannot be made. The results of this R+D project comprises four contributions to a solution complex problem: - A filed survey of preventive measures against spontaneous combustion in current operation yielded updated and quantifiable instructions for preventing spontaneous combustion within the framework of future planning. - The results of a newly developed laboratory method for determination of the coal's proneness to spontaneous combustion, on the basis of non-isothermal pyrolysis kinetics were well congruent with available data from the mine fire statistics of the past 20 years. - Analysis and assessment of tracer gases (in particular CO, H_2, C_2H_4) of spontaneous combustion processes underground allow an estimate of the temperatures prevailing in a given location of a fire. - The prototype of a novel measuring unit allows rapid spotting of mine fires in the caved-in goafs, and thus optimisation of nitrogen application for firelighting. 7166 (DOE/PC/90314–T9) **Hydrocarbon-oil encapsulated air bubble flotation of fine coal. Technical progress report for the fifth quarter, October 1, 1991–December 30, 1991.** Peng, F.F. West Virginia Univ., Morgantown, WV (United States). [1995]. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90314. Order Number DE95005511. Source: OSTI; NTIS; GPO Dep.

A main portion of this reporting period has been consumed in the following tasks: (i) Contact angle measurement using gasified collector encapsulated bubble; (ii) wettability measurement using film flotation method; (iii) induction time measurement; (iv) conducting atomized collector flotation tests in a stirred tank cell; (v) developing the experimental design and conducting a column flotation test. The coal samples used in this period of work are five ranks of coal samples from Mammoth, Lower Kittanning, Upper Freeport, Pittsburgh No. 8 and Wyodak seam coals. To better understand the fundamental steps involved in the modes of collector addition techniques in the froth flotation, contact angle, wettability and induction time were measurement. It was found increasing in the contact angles and decreasing in the induction time for a hydrocarbon-oil encapsulated air bubble compared to those for an oil-free bubble for all the coal samples measured. These observations may account for the improved flotation kinetics and, hence, the recovery with the hydrocarbon-oil encapsulated bubbles. Two level fractional factorial experimental design were developed for conducting the column flotation tests to obtain the optimal operating conditions. In the first series of the tests, seven operating parameters were considered with 16 runs. Based on those results, subsequently, the second experimental design was developed for six operating parameters with 16 runs. The third experiment design was formulated with three most significant operating parameters with 8 runs. A high combustible recovery was obtained for -200 mesh Upper Freeport coal sample. However, the results indicated

that for further reduction of the ash content of the froth product, the height of column flotation cell needed to be increased.

7167 (DOE/EA–0575) **Fundamental Fluidization Research Project. Environmental Assessment.** USDOE Morgantown Energy Technology Center, WV (United States). Jan 1994. 18p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95002669. Source: OSTI; NTIS; GPO Dep.

Morgantown Energy Technology Center proposes to conduct fundamental research on fluidization technology by designing, constructing, and operating a 2-foot diameter, 50-foot high, pressurized fluidized-bed unit. The anticipated result of the proposed project would be a better, understanding of fluidization phenomena under pressurized and high velocity conditions. This improved understanding would, provide a sound basis for design and scale-up of pressurized circulating fluidized-bed combustion (PCFBC) processes for fossil energy applications. Based on the analysis in the EA, DOE has determined that the proposed action is not a major, Federal action significantly affecting the quality of the human environment, within the meaning of the National Environmental Policy Act (NEPA) of 1969. Therefore, the preparation of an Environmental Impact Statement is not required and the Department is issuing this FONSI.

7168 (DOE/MC/27205–3964) **AFBC co-firing of coal and hospital waste. Quarterly progress report, August 1, 1994–October 31, 1994.** Stuart, J.M. Donlee Technologies, Inc., York, PA (United States). 31 Jan 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-91MC27205. Order Number DE95006154. Source: OSTI; NTIS; GPO Dep.

The project objective is to design, construct, install, operator training and start-up a circulating fluidized bed combustion system at the Lebanon Pennsylvania Veteran's Affairs Medical Center. This unit will co-fire coal and hospital waste providing inexpensive and efficient destruction of both general and infectious hospital waste and steam generation. The steam generated is as follows: The State permitting process required for construction is completed. Operating permits will be obtained after construction has been completed. Construction and equipment fabrication continues. The purchase of the equipment from vendors continues. The installation of the equipment at site started August 15, 1994. The piping began during October and continues.

7169 (DOE/MC/27362–3860) **Blast furnace granular coal injection project. Annual report, January–December 1993.** Bethlehem Steel Corp., PA (United States). Jun 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-91MC27362. Order Number DE94012286. Source: OSTI; NTIS; GPO Dep.

This initial annual report describes the Blast Furnace Granular Coal Injection project being implemented at Bethlehem Steel Corporation's (BSC) Burns Harbor, Indiana, plant. This installation will be the first in the United States to employ British Steel technology that uses granular coal to provide part of the fuel requirement of blast furnaces. The project will demonstrate/assess a broad range of technical/economic issues associated with the use of coal for this purpose. These include: coal grind size, coal injection rate, coal source (type) and blast furnace conversion method. Preliminary Design (Phase 1) began in 1991 with detailed design commencing in 1993. Construction at Burns Harbor (Phase 2) began in August 1993. Construction is expected to complete in the first quarter of 1995 which will be followed by the demonstration test program (Phase 3). Progress is described.

7170 (DOE/PC/89774–T11) **Modeling of single char combustion, including CO oxidation in its boundary layer.** Lee, C.H.; Longwell, J.P.; Sarofim, A.F. Massachusetts Inst. of Tech., Cambridge, MA (United States). 25 Oct 1994. 190p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-89PC89774. Order Number DE95005557. Source: OSTI; NTIS; GPO Dep.

The combustion of a char particle can be divided into a transient phase where its temperature increases as it is heated by oxidation, and heat transfer from the surrounding gas to an approximately constant temperature stage where gas phase reaction is important and which consumes most of the carbon and an extinction stage caused by carbon burnout. In this work, separate models were developed for the transient heating where gas phase reactions were unimportant and for the steady temperature stage where gas phase reactions were treated in detail. The transient char combustion model incorporates intrinsic char surface production of CO and CO_2, internal pore diffusion and external mass and heat transfer. The model provides useful information for particle ignition, burning temperature profile, combustion time, and carbon consumption rate. A gas phase reaction model incorporating the full set of 28 elementary C/H/O reactions was developed. This model calculated the gas phase CO oxidation reaction in the boundary layer at particle temperatures of 1250 K and 2500 K by using the carbon consumption rate and the burning temperature at the pseudo-steady state calculated from the temperature profile model but the transient heating was not included. This gas phase model can predict the gas species, and the temperature distributions in the boundary layer, the CO_2/CO ratio, and the location of CO oxidation. A mechanistic heat and mass transfer model was added to the temperature profile model to predict combustion behavior in a fluidized bed. These models were applied to data from the fluidized combustion of Newlands coal char particles. 52 refs., 60 figs.

7171 (DOE/PC/89805–T9) **Cross-flow, filter-sorbent-catalyst for particulate, SO_2 and NO_x control. Final report.** Benedek, K. (Little (Arthur D.), Inc., Cambridge, MA (United States)); Flytzani-Stephanopoulos, M. Little (Arthur D.), Inc., Cambridge, MA (United States). May 1994. 119p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89805. Order Number DE95001934. Source: OSTI; NTIS; GPO Dep.

This report describes work performed on a new concept for integrated pollutant control: An active filter comprised of layered, gas permeable membranes that act as a particle filter, an SO_2 sorbent, and a NO_x, reduction catalyst. The focus of the research program documented in this final report is the development of the sorbent/catalyst materials that are the basis of such an emission control system. The device investigated in this program will simultaneously remove particulates, SO_2 and NO_x, from combustion exhaust gases. Sulfur dioxide capture and nitrogen oxide reduction are achieved with a reg le, mixed-metal oxide sorbent-catalyst. The device is a filter with layered walls: A small-pore layer is a barrier to particles, and a macroporus active layer is a SO_2 sorbent and a catalyst for the selective catalytic reduction of NO_x. The small-pore layer could be an inert ceramic that provides structural strength to the unit and protects the active (sorbent-catalyst) material from abrasion or contamination from fly ash particles. We have found that 95–100% removal efficiency of SO_2 and 60–90% removal of NO_x, is achievable with the use of mixed-metal oxide sorbent-catalysts in the device. The ceramic filters are barriers to particles and typically have removal efficiencies of 99.9%.

7172 (DOE/PC/91161–T9) **A coal-fired combustion system for industrial process heating applications. Quarterly technical progress report, April 1994–June 1994.** Vortec Corp., Collegeville, PA (United States). 30 Jul 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91161. Order Number DE95004313. Source: OSTI; NTIS; GPO Dep.

This advanced combustion system research program is for the development of innovative coal-fired process heaters which can be used for high temperature melting, smelting and waste vitrification processes. The process heater systems to be developed have multiple use applications; however, the Phase III research effort is being focused on the development of a process heater system to be used for producing value added vitrified glass products from boiler/incinerator ashes and industrial wastes. The primary objective of the Phase III project is to develop and integrate all the system components, from fuel through total system controls, and then test the complete system in order to evaluate its potential

marketability. During the past quarter, the major effort was concentrated on completing the modifications to the test facility and completing a Test Plan for the long duration testing. The system modifications included the installation and shakedown testing of the new coal storage and feeding system, modifications to the existing batch handling system, and integration of a single wheel mineral wool fiberizer. All of the modifications required to conduct 100 hrs of continuous testing have now been completed. The test program will consist of one test run, with a duration of 100 hours at a nominal feed rate of 1000 lbs/hr. Throughout the test, the CMS will be fired with coal and a coal by-product (i.e. coal-fired boiler flyash) as the primary fuels. Natural gas will be used as an auxiliary fuel as necessary to provide process trim. The feedstock will consist of a coal-fired utility boiler flyash and any glass forming agents required to produce a stable, fully-reacted vitrified product. The fly ash, supplied by PENELEC, contains between 6 and 12% by weight of carbon because of the low NOx burners on the PENELEC boilers. Therefore, a substantial portion of the required thermal input will come from the fly ash.

7173 (DOE/PC/91308–12) **Particulate behavior in a controlled-profile pulverized coal-fired reactor: A study of coupled turbulent particle dispersion and thermal radiation transport. Quarterly technical progress report, June 15–September 14, 1994.** Queiroz, M.; Webb, B.W. Brigham Young Univ., Provo, UT (United States). [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91308. Order Number DE95005198. Source: OSTI; NTIS; GPO Dep.

Improved understanding of the fundamental processes involved in pulverized-coal combustion is needed to make the energy extraction more efficient and the combustion byproducts environmentally safe. This proposal seeks to characterize the local particulate concentration, velocity, and size distribution in a well-controlled, parametrically-varied laboratory-scale reactor using a new laser diagnostic technique. This newly-developed technique is the only one currently available for the investigation of aspherical particles. The particulate data will be collected simultaneously with local gas temperature and wall radiant heat flux distributions. Although the study proposed here is primarily designed to provide experimental data not currently available for the evaluation of turbulent particle dispersion and radiation models, comparisons of analytical predictions and the experimental data obtained will be performed, using appropriate submodels integral to comprehensive pulverized-coal combustion codes existent at Brigham Young University. During the twelfth quarter progress has been made in the following areas: (1) reduction of experimental data recently collected; and (2) particle dispersion modeling. This report summarizes findings from these two areas.

7174 (DOE/PC/92159–T9) **Air toxics evaluation of ABB Combustion Engineering Low-Emission Boiler Systems.** Wesnor, J.D. (ABB/Combustion Engineering, Inc., Windsor, CT (United States)). ABB/Combustion Engineering, Inc., Windsor, CT (United States); Energy and Environmental Research Corp., Irvine, CA (United States). 26 Oct 1993. 212p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92159. Order Number DE95002579. Source: OSTI; NTIS; GPO Dep.

The specific goals of the program are to identify air toxic compounds that might be emmitted from the new boiler with its various Air Pollution Control device for APCD alternatives in levels of regulatory concern. For the compounds thought to be of concern, potential air toxic control methodologies will be suggested and a Test Protocol will be written to be used in the Proof of Concept and full scale tests. The following task was defined: Define Replations and Standards; Identify Air Toxic Pollutants of Interest to Interest to Utility Boilers; Assesment of Air Toxic By-Products; State of the Art Assessment of Toxic By-Product Control Technologies; and Test Protocol Definition.

7175 (DOE/PC/92190–T6) **Fundamental study of ash formation and deposition: Effect of reducing stoichiometry. Quarterly report No. 6, 1 July–30 September 1994.** Helble, J.J. (Physical Sciences, Inc., Andover, MA (United States)); Bool, L.E.; Huffman, G.P.; Huggins, F.E.; Shah, N.; Peterson, T.W.; Gallien, D.; Sarofim, A.F.; Zeng, Taofang,. Physical Sciences, Inc., Andover, MA (United States). Nov 1994. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC92190. Order Number DE95006206. Source: OSTI; NTIS; GPO Dep.

The work discussed in highlights the accomplishments of the sixth quarter of this two year project. This includes University of Kentucky Moessbauer and computer controlled scanning electron microscopy (CCSEM) analysis of combustion ash samples generated by MIT and PSI Technologies (PSIT); a discussion of the MIT test results; a discussion of the University of Arizona's ongoing efforts in drop tube reactor combustion testing; and additional analysis of ash deposition data by PSIT. Recently completed University of Kentucky analyses of combustion ash samples are presented. Specifically, Moessbauer analysis of a size graded sample of beneficiated Pittsburgh No. 8 coal was compared with the same analysis performed on a utility grind sample. A much lower percentage of sulfate was found in the size graded, <75 μm sample prepared by MIT than in the utility grind sample studied by PSIT. Moessbauer analysis of ash samples generated from combustion of this size-graded coal at MIT demonstrated increasing iron-containing glass formation with increasing oxygen partial pressure. CCSEM analyses of the Silverdale coal (United Kingdom, bituminous) and ash samples derived from this coal in combustion testing at PSIT are also presented. Iron aluminosilicate formation was observed for these samples.

7176 (DOE/PC/92528–7) **Char particle fragmentation and its effect on unburned carbon during pulverized coal combustion. Quarterly report, April 1–June 30, 1994.** Diaz, R.; Mitchell, R.E. Stanford Univ., CA (United States). High Temperature Gasdynamics Lab. Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92528. Order Number DE95005203. Source: OSTI; NTIS; GPO Dep.

The knowledge obtained during the course of this project will be used to predict accurately the overall mass loss rates of coals based on the mineral content and porosity of their chars. The work will provide a means of assessing reasons for unburned carbon in the ash of coal fired boilers and furnaces. During this quarter, the particle population model, discussed in the previous quarterly, was used to characterize the fragmentation observed during extraction of char samples from the laminar flow reactor. Because present measurements of the particle distribution were performed with a single orifice tube with a lower particle size limit of about 5 μm, curve fits to the measured size distributions were used to estimate the number of particles below about 5 μm. These estimates were then used with the model in the characterizations. Using the particle population model, the authors determined that about 0.1% of the particles placed in the particle feeder produced small fragments during the particle extraction and collection on filter paper. The fragmentation was characterized as attrition, where small fragments are shed from the particle periphery leaving the sizes of particles almost unchanged, (and hence leaving the number of particles in the larger size fractions essentially the same). Based on these results, the authors feel confident that char fragmentation associated with burning can be distinguished from char fragmentation associated with the sampling process. During burning, the dominant mode of fragmentation is likely to be characterized as breakage, where the number of particles in the larger size fractions decreases as fragmentation progresses.

7177 (DOE/PC/93221–T4) **Combustion of pulverized coal in vortex structures. Quarterly progress report number 4, July 1–September 30, 1994.** Gollahalli, S.R. Oklahoma Univ., Norman, OK (United States). School of Aerospace and Mechanical Engineering. Oct 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93221. Order Number DE95005183. Source: OSTI; NTIS; GPO Dep.

The overall objectives of the project are: (1) to investigate the changes in the characteristics of large scale vortex structures in the shear layer caused by the introduction of inert solid particles in one of the feed streams; (2) to understand the effects of pyrolyzing solids on the shear layer behavior; (3) to study the effect of combustion of the pyrolysis products on the shear layer structure, heat release rate, and pollutant emission characteristics; and (4) to study the effect of modifying the shear layer characteristics on the

ensuing flame behavior. The work performed in this quarter consisted of the following tasks: (1) design, fabrication, and debugging of the particulate feeding system, (2) automating the data acquisition system. In the next quarter, the author plans to work on flow visualization of the shear layer and velocity field measurements with and without nonreacting particulates.

7178 (DOE/PC/93226–T4) **Investigation of mineral transformations and ash deposition during staged combustion. Quarterly technical progress report, July 1–September 30, 1994.** Harb, J.N. Brigham Young Univ., Provo, UT (United States). 3 Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93226. Order Number DE95005194. Source: OSTI; NTIS; GPO Dep.

Progress during the fourth quarter of a three-year study was made in three areas: (1) coal selection and characterization (Task 1), (2) combustor modifications and preliminary testing (Task 2), and (3) sample analysis (Task 4). A detailed CCSEM analysis of the mineral content of Pittsburgh #8 was performed during the quarter. This analysis includes identification of the major mineral phases found in the coal, as well as quantification of the association between the organic and inorganic phases. A large fraction of the minerals were excluded (greater than 80% mineral), although a significant fraction of the minerals was found in particles which were greater than 20% coal. Associations between specific minerals were also examined on a particle-by-particle basis. These associations provide information on the potential for coalescence of mineral grains to form complex ash species. In addition to coal analysis, the first extended coal-fired tests were completed this quarter. The deposition probe and particle collection system were also completed and tested. The reactor system performed very well, with the exception of some feeding problems which will be resolved during the next quarter. Initial samples of combustion products from the Black Thunder coal were collected and analyzed. Finally, specific tasks for the next quarter have been identified and reported.

7179 (DOE/PC/94211–T1) **Co-firing high sulfur coal with refuse derived fuels. Technical progress report No. 1, [September–November 1994].** Pan, Wei-Ping; Riley, J.T.; Lloyd, W.G. Western Kentucky Univ., Bowling Green, KY (United States). Dept. of Chemistry. 30 Nov 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94211. Order Number DE95006243. Source: OSTI; NTIS; GPO Dep.

This project is being coordinated with an ongoing project at Western Kentucky University that is being supported by the Southeastern Regional Biomass Energy Program through the Tennessee Valley Authority. Fluidized bed combustion tests will be performed on municipal solid waste blended with high-sulfur and high-chlorine coals in a laboratory scale combustor. The purpose of the tests is to evaluate combustion performance, the extent of the inorganic acid gases (HCl and SO_x) and chlorinated organic compound formation, the effect of chlorine species on SO_2 removal with a sorbent, and the effect of sulfur species on the formation of chlorinated organic compounds from MSW for a range of bed temperatures, excess air levels, MSW/coal ratios, and S/Cl ratios. Flue gas samples will be collected and analyzed at three locations: free board, cyclone inlet, and cyclone outlet. Analytical methods used will include ion chromatography, gas chromatography, and mass spectrometry. Waste stream ash samples will be collected from the cyclone catch and analyzed for unburned carbon, chlorine, chlorinated benzenes, polychlorinated biphenyls, chlorinated phenols, dioxins, furans, and metal content. Major, minor, and trace elements in the ash will be determined by x-ray fluorescence and inductively coupled plasma-atomic emission spectroscopy. Accomplishments for the first quarter are presented.

7180 (FAAR–23/1993, pp. 7-12) **Numerical simulation of vapour-aerosol dynamics in high temperature processes.** Jokiniemi, J.K. (Technical Research Centre of Finland, Espoo (Finland). Aerosol Technology Group); Lazaridis, M.; Lehtinen, K.E.J.; Kauppinen, E.I. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science*. 292p. Order Number DE95737628. Source: OSTI; NTIS.

In solid and liquid fuel combustion processes aerosol particles are formed from volatilised species and from non-volatilised mineral inclusions. The behaviour of these particles is of great importance when considering slagging and fouling in commercial boilers and toxic flue gas emissions. In this study we have constructed a general ABC (Aerosol Behaviour in Combustion) computer model to describe the formation, growth and deposition of aerosol particles formed from vapour species and ash components in combustion processes. So far this model has been applied for alkali species behaviour in pulverised and fluidized bed coal combustion processes as well as kraft recovery boilers.

7181 (FAAR–23/1993, pp. 69-74) **Real scale studies on alkali metal transformations in atmospheric CFBC of coal.** Lind, T. (Technical Research Centre of Finland, Espoo (Finland). Aerosol Technology Group.); Kauppinen, E.I.; Jokiniemi, J.K.; Maenhaut, W.; Maekinen, M. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science*. 292p. Order Number DE95737628. Source: OSTI; NTIS.

In this study, we address the sodium and potassium behaviour during the combustion of bituminous coal in a real-scale circulating fluidised bed. The bituminous coal and limestone additive used in the study were carefully characterised for composition and particle size distributions (PSD). The ash PSDs and compositions after the combustion were characterised from ESP-collected fly ash and boiler bottom ash. Experiments were carried out to determine the aerosol characteristics, i.e. the detailed fly ash particle size distributions in the particle size range 0.01-70 μm, and the gas compositions at conditions immediately before the electrostatic precipitator (ESP). A numerical aerosol simulation model was developed to describe the combustion aerosol dynamics. The model combined with local chemical equilibrium calculations was used to study the behaviour of particulate matter and gaseous species in the aerosol formed in the FBC.

7182 (FAAR–23/1993, pp. 81-86) **Field studies on ash transformation during pulverized coal combustion of bituminous coal.** Joutsensaari, J. (Technical Research Centre of Finland, Espoo (Finland). Aerosol Technology Group); Kauppinen, E.I.; Jokiniemi, J.K. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science*. 292p. Order Number DE95737628. Source: OSTI; NTIS.

In this study, we have focused on ash vaporization and condensation behaviour in the real scale pulverized combustion of bituminous coal from Poland. Gas phase fly ash particle mass, number and composition size distributions were determined experimentally at conditions upstream the electrostatic precipitator (ESP) by utilizing advanced aerosol measurement methods. The morphology of fly ash particles was studied by SEM (Scanning Electroni Microscopy). In addition, we characterized in detail the parent coal with respect to distribution of mineral matter by CCSEM (Computer Controlled Scanning Electron Microscopy) and CF (Chemical fractionation) methods. Both bottom and fly ash collected by the ESP were analyzed using CCSEM to observe the reactions between organically bound inorganic species and mineral inclusions during the combustion process. The vaporization behaviour of both organically and inorganically distributed mineral species is discussed based on experimental data.

7183 (FAAR–23/1993, pp. 112-117) **Particle emissions from pressurized fluidized bed combustion.** Jalovaara, J. (Helsinki Univ. of Technology, Otaniemi (Finland). Dept. of Energy Engineering); Hippinen, I. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). This presentation reports a part of the study of particle emissions and their reduction using a fibrous, layered, ceramic candle filter in pressurized fluidized bed combustion made at Helsinki University of Technology during 1991-1992.

7184 (FAAR–23/1993, pp. 167-172) **Fine particle aspects of fluidized bed processes.** Horio, M. (Tokyo Univ. of Agriculture

and Technology (Japan). Dept. of Chemical Engineering). Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science*. 292p. Order Number DE95737628. Source: OSTI; NTIS.

Fluidization is a unique unit operation of chemical engineering rich in topics of research and developments. In 1960's, when the fundamental formulation of dense suspension was completed and bubble models such as Davidson's became the basic tools for analysis and design, the purely scientific interest in the fluidization phenomena that has been held by physical scientists seemed to have faded away. However, the spectrum of fluidization has become quite wide. In the 60's we did not have 'fast fluidization' nor 'group C (cohesive) powders'. Now in the 90's again the attitude to look at fluidization as a natural phenomenon of particle suspensions is becoming more important. In this article the historical developments of knowledge on fluidization is reviewed and energetics and phase transition of dispersed solids are discussed. (orig.)

7185 (FAAR–23/1993, pp. 173-178) **Simultaneous in-situ measurements of temperature and size of burning char particles in a fluidized bed furnace by means of fiber optic pyrometry.** Stenberg, J. (Tampere Univ. of Technology (Finland). Plasma Technology Lab.); Hernberg, R. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science*. 292p. Order Number DE95737628. Source: OSTI; NTIS.

Fluidized bed combustion is a particularly demanding environment for diagnostics. Important parameters are fuel particle temperature, size and their interrelation, and further, the spatial distribution of fuel particles in the reactor. It has been demonstrated that the pyrometric fiber optic probe is a very viable tool for particle diagnostics in a fluidized bed furnace. In addition to the temperature of the bed and fuel particles it is capable of producing valuable results regarding the size of fuel particles as well. The size information in combination with the particle temperature can serve the study many different aspects of interest in fluidized bed technology, like fuel reactivity, furnace dynamics etc.

7186 (TTKK-LT–90) **Combustion experiments of fuel gases in atmospheric fluidized bed combustor test rig.** Wallen, V. Tampere Univ. of Technology (Finland). Thermal Engineering. 1993. 22p. Order Number DE95737622. Source: OSTI; NTIS.

This paper describes the combustion measurements done in a bubbling fluidized bed combustor at Tampere University of Technology. This study forms a part of a larger project, the object of which is to develop a total model for ignition and combustion of the volatile matter released from solid high-volatile fuel in a bubbling fluidized bed. In modelling of fluidized bed combustor it is important to describe correctly the combustion reactions and the phases in which they occur. In peat combustion, although a large percentage of the heat content can be contained within the volatiles, the mechanism of volatile combustion has not been determined so far. In a fluidized bed every sand particle acts like a wall and the so-called 'wall effects' have a strong influence on the combustion mechanism. Therefore combustion models in which the wall reactions are not included cannot be used in the particulate or in the bubble phase of a fluidized bed. The moisture present in bed was found to be of great importance especially when carbon monoxide was used as fuel gas. The effect of moisture to the reaction rate of carbon monoxide-air mixture was found to be opposite to that measured in air. This means, that correlations for carbon monoxide oxidation found in the literature cannot be used when modelling combustion inside a fluidized bed. The results presented in this paper are some of those I got from nearly 300 test runs. A lot more experiments have to be made with different fuel gases before we can better understand the nature of volatile combustion in fluidized bed.

The objective of this project is to integrate advanced geoscience and reservoir engineering concepts with the goal of quantifying the dynamics of fluid-rock and fluid-fluid interactions as they relate to

reservoir architecture and lithologic characterization. This interdisciplinary effort will integrate geological and geophysical data with engineering and petrophysical results through reservoir simulation. Subcontractors from Stanford University and the University of Texas at Austin (UT) are collaborating on the project. Several members of the PRRC staff are participating in the development of improved reservoir description by integration of the field and laboratory data, as well as in the development of quantitative reservoir models to aid performance predictions.

7192 (DOE/BC/14896–4) **Geological and petrophysical characterization of the Ferron Sandstone for 3-D simulation of a fluvial-deltaic reservoir. Quarterly report, July 1–September 30, 1994.** Allison, M.L. (Utah Geological and Mineral Survey, Salt Lake City, UT (United States)). USDOE Bartlesville Project Office, OK (United States). 30 Oct 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14896. Order Number DE95005334. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to develop a comprehensive, interdisciplinary, and quantitative characterization of a fluvial-deltaic reservoir which will allow realistic inter-well and reservoir-scale modeling to be developed for improved oil-field development in similar reservoirs world-wide. The geological and petrophysical properties of the Cretaceous Ferron Sandstone in east-central Utah will be quantitatively determined. Both new and existing data will be integrated into a 3-D representation of spatial variations in porosity, storativity, and tensorial rock permeability at a scale appropriate for inter-well to regional-scale reservoir simulation. Results could improve reservoir management through proper infill and extension drilling strategies, reduction of economic risks, increased recovery from existing oil fields, and more reliable reserve calculations. Transfer of the project results to the petroleum industry is an integral component of the project.

7193 (DOE/BC/14970–1) **Gypsy Field project in reservoir characterization. Quarterly progress report, May 19–September 30, 1994.** O'Meara, D.J. Jr. Oklahoma Univ., Norman, OK (United States). Center for Reservoir Characterization. [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94BC14970. Order Number DE95005315. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to use the extensive Gypsy Field laboratory and data set as a focus for developing and testing reservoir characterization methods that are targeted at improved recovery of conventional oil. The Gypsy Field laboratory consists of coupled outcrop and subsurface sites which have been characterized to a degree of detail not possible in a production operation. Data from these sites entail geological descriptions, core measurements, well logs, vertical seismic surveys, a 3D seismic survey, crosswell seismic surveys, and pressure transient well tests. The overall project consists of four interdisciplinary sub-projects which are closely interlinked: Modeling deposition environments; Integrated 3D seismic interpretation; Sweep Efficiency; and Tracer testing. During this quarter, main activities involved three sub-projects: Modeling Depositional Environments. The use of thin-plate and tension splines for detecting discontinuities in geological or petrophysical properties was examined. In an example derived from the Gypsy outcrop, tension splines were clearly superior. Integrated 3D Seismic Interpretation. A three-dimensional geological model of the Gypsy subsurface site has been constructed using 3D seismic data, constrained by well log and core data. Eight seismic horizons were mapped based on seismic data yielding geometrical information on major sand and shale zones. Sweep Efficiency. As a first step in examining the cubature method as an alternative to IMPES schemes, the equations and a numerical scheme have been formulated for two-dimensional flow in heterogeneous reservoirs. Development has begun on a computer program for implementing this numerical scheme.

7194 (NEI-NO–472) **The perspectives of Norwegian petroleum resources.** Nystad, A.N. (Norwegian Petroleum Directorate (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1993. 9p. (CONF-930567–1: 14. Bergen conference on oil and economics, Bergen (Norway), 10-11 May 1993). Order Number DE95737640. Source: OSTI; NTIS.

In order to relate the remaining Norwegian petroleum resources to a time perspective one has to make assumptions of the future production of oil and gas. If there is assumed an average annual oil production of 80 million tons (the average the last 5 years) and an average annual gas production of 65 million ton oil equivalent (t.o.e.), which is a realistic future level of exploitation, the oil resources will last for approximately 45 years and the gas resources for approximately 80 years. There is expected that the future resources will be more challenging to find, exploit and commercialize, than those resources which are discovered so far. It is therefore important to follow strategies which maintain a high economical efficiency in all phases of the petroleum activity by looking into the possibilities for improvements. This is a continuous process which is important in order to maintain the Norwegian Continental Shelf internationally competitive. Profitable projects within improved oil recovery from existing fields, technical solutions which make it possible to exploit smaller oil and gas fields and cost efficient ways in order to discover the remaining resources on the Norwegian Shelf must be established. The remaining petroleum resources give a long term perspective in relation to the future petroleum activities on the Norwegian Shelf. 4 figs.

7195 (DOE/BC–94/1) **Enhanced oil recovery. Progress review, October–December 1993.** USDOE Bartlesville Project Office, OK (United States). 31 Dec 1993. 117p. Sponsored by USDOE, Washington, DC (United States). Order Number DE94000200. Source: OSTI; NTIS; GPO Dep.

This document details current research in the area of enhanced recovery of petroleum as sponsored by the DOE. Progress reports are provided for over thirty projects.

7196 (DOE/BC/14654–T6) **Simulation studies to evaluate the effect of fracture closure in the performance of naturally fractured reservoirs. Third quarterly progress report.** Dauben, D.L. K and A Energy Consultants, Inc., Tulsa, OK (United States). 15 Jul 1992. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14654. Order Number DE95005803. Source: OSTI; NTIS; GPO Dep.

The study has two principal objectives: (1) to evaluate the effects of fracture closure on the recovery of oil and gas reserves from naturally fractured petroleum or natural gas reservoirs, (2) to evaluate procedures for improving the recovery of these reserves using innovative fluid injection techniques to maintain reservoir pressure and mitigate the impact of fracture closure. The total scope of the study has been subdivided into three main tasks: baseline studies (non-pressure sensitive fractures), studies with pressure sensitive fractures, and innovative approaches for improving oil recovery.

7197 (DOE/BC/14654–T8) **Simulation studies to evaluate the effect of fracture closure on the performance of naturally fractured reservoirs. Annual report.** K and A Energy Consultants, Inc., Tulsa, OK (United States). Nov 1992. 134p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14654. Order Number DE95005805. Source: OSTI; NTIS; GPO Dep.

The second year of this three-year research program to evaluate the effect of fracture closure on the recovery of oil and gas from naturally fractured reservoirs has been completed. The overall objectives of the study are to: (1) evaluate the reservoir conditions where fracture closure is significant, and (2) evaluate innovative fluid injection techniques capable of maintaining pressure within the reservoir. Simulation studies have been conducted with a dual porosity simulator capable of simulating the performance of vertical and horizontal wells. Each simulation model has been initialized with properties typical of the Austin Chalk reservoir in Pearsall Field, Texas. During year one, simulations of both vertical and horizontal well performance were made assuming that fracture permeability was insensitive to pressure charge. The results confirmed that horizontal wells could increase both rate of oil recovery and total oil recovery from naturally fractured reservoirs. During the second year the performances of the same vertical and horizontal wells

were evaluated with the assumption that fracture permeability was a function of reservoir pressure. This required repetition of most of the natural depletion cases simulated in year one while invoking the pressure-sensitive fracture permeability option. To investigate sensitivity to in situ stress, two stress conditions were simulated for each primary variable. The water injection cases, begun in year one, were extended to include most of the reservoir parameters investigated for natural depletion, including fracture permeability as a function of net stress and the use of horizontal wells. The results thus far confirm that pressure-sensitive fractures degrade well performance and that the degradation is reduced by water injection pressure maintenance. Furthermore, oil recovery can be significantly increased by water injection pressure maintenance.

7198 (DOE/BC/14654–T9) **Simulation studies to evaluate the effect of fracture closure on the performance of naturally fractured reservoirs. Annual report.** K and A Energy Consultants, Inc., Tulsa, OK (United States). Oct 1991. 129p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14654. Order Number DE95005806. Source: OSTI; NTIS; GPO Dep.

The first of a three-year research program to evaluate the effect of fracture closure on the recovery of oil and gas from naturally fractured reservoirs has been completed. The objectives of the study are to (1) evaluate the reservoir conditions where fracture closure is significant, and (2) evaluate innovative fluid injection techniques capable of maintaining pressure within the reservoir. Simulation studies were conducted with a dual porosity simulator capable of simulating the performance of vertical and horizontal wells. Each simulator was initialized using properties typical of the Austin Chalk reservoir in Pearsall Field, Texas. Simulations of both vertical and horizontal well performance were made assuming that fracture permeability was insensitive to pressure change. Sensitivity runs indicate that the simulator is predicting the effects of critical reservoir parameters in a logical and consistent manner. The results to-date confirm that horizontal wells can increase both oil recovery rate and total oil recovery from naturally fractured reservoirs. The year one simulation results will provide the baseline for the ongoing study which will evaluate the performance degradation caused by the sensitivity of fracture permeability to pressure change, and investigate fluid injection pressure maintenance as a means to improve oil recovery performance. The study is likely to conclude that fracture closure decreases oil recovery and that pressure support achieved through fluid injection could be beneficial in improving recovery.

7199 (DOE/BC/14662–15) **Quantitation of microbial products and their effectiveness in enhanced oil recovery. Final report.** Zhang, X.; Knapp, R.M.; McInerney, M.J. Oklahoma Univ., Norman, OK (United States). Feb 1995. 154p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14662. Order Number DE95000121. Source: OSTI; NTIS; GPO Dep.

A three-dimensional, three-phase, multiple-component numerical simulator was developed to investigate transport and growth of microorganisms in porous media and the impacts of microbial activities on oil recovery. The microbial activities modeled in this study included: (1) growth, retention, chemotaxis, and end product inhibition of growth, (2) the formation of metabolic products, and (3) the consumption of nutrients. Major mechanisms for microbial enhanced oil recovery (MEOR) processes were modeled as follows: (1) improvement in sweep efficiency of a displacement process due to in situ plugging of highly-permeable production zones by cell mass or due to improved mobility control achieved by increasing the viscosity of the displacing fluid with a biopolymer, and (2) solubilization and mobilization of residual oil in porous media due to the reduction of the interfacial tension between oleic and aqueous phases by the production of a biosurfactant. The numerical solutions for mathematical models involved two steps. The distributions of pressure and phase saturations were solved from continuity equations and Darcy flow velocities for the aqueous phase were computed. This was followed by the solution of convection-dispersion equations for individual components. Numerical solutions from the proposed model were compared to results obtained from analytical equations, commercial simulators, and laboratory experiments. The comparison indicated that the model accurately quantified microbial transport and metabolism in porous media, and predicted additional crude oil recovery due to microbial processes. 50 refs., 41 figs., 26 tabs.

7200 (DOE/BC/14664–12) **Polysaccharides and bacterial plugging. Final report, 1992–1993.** Fogler, H.S. Michigan Univ., Ann Arbor, MI (United States). Feb 1995. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14664. Order Number DE95000127. Source: OSTI; NTIS; GPO Dep.

In situ core plugging experiments and transport experiments, using the model bacteria Leuconostoc m., have been conducted. Results demonstrated that cellular polysaccharide production increases cell distribution in porous media and caused an overall decrease in media permeability. Further, a parallel core plugging experiment was conducted and showed the feasibility of this system to divert injection fluid from high permeability zones into low permeability zones within porous media as is needed for profile modification. To implement this type of application, however, controlled placement of cells and rates of polymer production are needed. Therefore, kinetic studies were performed. A kinetic model was subsequently developed for Leuconostoc m. bacteria. This model is based on data generated from batch growth experiments and allows for the prediction of saccharide utilization, cell generation, and dextran production. These predictions can be used to develop injection strategies for field implementation. Transport and in situ growth micromodel experiments have shown how dextran allow cells to remain as clusters after cell division which enhanced cell capture and retention in porous media. Additional Damkohler experiments have been performed to determine the effects of the nutrient injection rate and nutrient concentration on the rate of porous media plugging. As shown experimentally and as predicted by a model for in situ growth, an increase in nutrient concentration and/or its injection rate will result in a faster rate of porous media plugging. Through continuum model simulations, it has been shown that the initial cell profiles play a key role on the core plugging rate. Controlling the location of the inoculating cells is thus another key factor in using bacteria for profile modification.

7201 (DOE/BC/14831–12) **Assist in the recovery of bypassed oil from reservoirs in the Gulf of Mexico. Quarterly status report (final), July 1–September 30, 1994.** Schenewerk, P.A. Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Petroleum Engineering. 30 Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14831. Order Number DE95005344. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to assist the recovery of non contacted oil from known reservoirs on the Outer Continental Shelf in the Gulf of Mexico. Mature offshore reservoirs, declining oil reserves, declining production, and other natural forces are accelerating the abandonment of offshore oil resources and production platforms. As these offshore wells are plugged and the platforms are abandoned, an enormous volume of remaining oil will be permanently abandoned. Significant quantities of this oil could be recovered using advanced technologies now available if the resource can be identified. This project will proceed under three broad phases: (1) Analysis – TORIS level data will be collected on the major fields located in the piercement salt dome province of the Gulf of Mexico Outer Continental Shelf. Representative reservoirs will be studied in detail in order to evaluate undeveloped and attic oil reserve potential. These detailed investigations will be used to calibrate the TORIS level predictive models. The recovery potential of advanced secondary and enhanced oil recovery processes and the exploitation of undeveloped and attic oil zones for salt dome reservoirs in the Gulf of Mexico will be assessed. (2) Supporting Research – Supporting research will focus on the modification of public domain reservoir simulation models to accurately simulate the conditions encountered in the piercement salt dome province of the Gulf of Mexico. Laboratory research will focus on the development of fluid relationships that will be used in the simulation of miscible and immiscible processes in the project area. (3) Technology Transfer – A significant effort is planned to transfer the

results of this project to potential users of the technology. Technology transfer activities will also provide feedback channels that will help keep the analysis and supporting research focused on the most important problems associated with this project.

7202 (DOE/BC/14856–1) **A model technology transfer program for independent operators: Kansas Technology Transfer Model (KTTM).** Schoeling, L.G. Kansas Univ., Lawrence, KS (United States). Energy Research Center. Sep 1993. 133p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92BC14856. Order Number DE95001703. Source: OSTI; NTIS; GPO Dep.

This report describes the development and testing of the Kansas Technology Transfer Model (KTTM) which is to be utilized as a regional model for the development of other technology transfer programs for independent operators throughout oil-producing regions in the US. It describes the linkage of the regional model with a proposed national technology transfer plan, an evaluation technique for improving and assessing the model, and the methodology which makes it adaptable on a regional basis. The report also describes management concepts helpful in managing a technology transfer program. The original Tertiary Oil Recovery Project (TORP) activities, upon which the KTTM is based, were developed and tested for Kansas and have proved to be effective in assisting independent operators in utilizing technology. Through joint activities of TORP and the Kansas Geological Survey (KGS), the KTTM was developed and documented for application in other oil-producing regions. During the course of developing this model, twelve documents describing the implementation of the KTTM were developed as deliverables to DOE. These include: (1) a problem identification (PI) manual describing the format and results of six PI workshops conducted in different areas of Kansas, (2) three technology workshop participant manuals on advanced waterflooding, reservoir description, and personal computer applications, (3) three technology workshop instructor manuals which provides instructor material for all three workshops, (4) three technologies were documented as demonstration projects which included reservoir management, permeability modification, and utilization of a liquid-level acoustic measuring device, (5) a bibliography of all literature utilized in the documents, and (6) a document which describes the KTTM.

7203 (DOE/BC/14860–8) **Detailed evaluation of the West Kiehl alkaline-surfactant-polymer field project and it's application to mature Minnelusa waterfloods. Technical progress report, July–September, 1994.** Pitts, M.J. Surtek, Inc., Golden, CO (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14860. Order Number DE95005332. Source: OSTI; NTIS; GPO Dep.

The objective is to (1) quantify the incremental oil produced from the West Kiehl alkaline-surfactant-polymer project by classical engineering and numerical simulation techniques, (2) quantify the effect of chemical slug volume on incremental oil in the two swept areas of the field, (3) determine the economics of the application of the alkaline-surfactant-polymer technology, (4) forecast the results of injecting an alkaline-surfactant-polymer solution to mature waterfloods and polymer floods, and (5) provide the basis for independent operators to book additional oil reserves by using the alkaline-surfactant-polymer technology. A geological study of 72 Minnelusa field surrounding the West Kiehl is complete. Of the 72 fields, 35 were studied in detail and, from these 35 fields, Prairie Creek South and Simpson Ranch were selected for numerical simulation as representative of Minnelusa waterfloods and polymer floods, respectively. This report documents the numerical simulation waterflood, polymer flood, alkaline-surfactant flood and alkaline-surfactant-polymer flood predictions from the West Kiehl, Simpson Ranch and Prairie Creek South fields.

7204 (DOE/BC/14861–5) **Horizontal oil well applications and oil recovery assessment. Technical progress report-final, July 1994–September 1994.** McDonald, W.J. Maurer Engineering, Inc., Houston, TX (United States). 3 Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14861. Order Number DE95005333. Source: OSTI; NTIS; GPO Dep.

Thousands of horizontal wells are being drilled each year in the U.S.A. and around the world. Horizontal wells have increased oil and gas production rates 3 to 8 times those of vertical wells in many areas and have converted non-economic oil reserves to economic reserves. However, the use of horizontal technology in various formation types and applications has not always yielded anticipated success. The primary objective of this project is to examine factors affecting technical and economic success of horizontal well applications. The project's goals will be accomplished through six tasks designed to evaluate the technical and economic success of horizontal drilling, highlight current limitations, and outline technical needs to overcome these limitations. Data describing operators experiences throughout the domestic oil and gas industry will be gathered and organized. Canadian horizontal technology will also be documented with an emphasis on lessons the U.S.A. industry can learn from Canada's experience. MEI databases containing detailed horizontal case histories will also be used. All these data will be categorized and analyzed to assess the status of horizontal well technology and estimate the impact of horizontal wells on present and future domestic oil recovery and reserves.

7205 (DOE/BC/14862–7) **Productivity and injectivity of horizontal wells. Quarterly report, July 1, 1994–September 30, 1994.** Fayers, F.J. Stanford Univ., CA (United States). Dept. of Petroleum Engineering. [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14862. Order Number DE95005338. Source: OSTI; NTIS; GPO Dep.

This quarterly report is entirely devoted to presenting samples of the results of the data analyses for horizontal drilling studies. In addition, a data compilation of Excel worksheets containing data on two-phase flow measurements at the Marathon Oil Company is discussed. Complete data analyses will be presented in the next annual report.

7206 (DOE/BC/14875–5) **Research program on fractured petroleum reservoirs. Quarterly progress report, July 1–September 30, 1994.** Firoozabadi, A. Reservoir Engineering Research Inst., Palo Alto, CA (United States). 30 Oct 1994. 100p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93BC14875. Order Number DE95005326. Source: OSTI; NTIS; GPO Dep.

This report describes results from three projects. Project 1, Miscible displacement in fractured/layered porous media, studies the crossflow in the medium incorporating gravity, viscous, and phase behavior effects. Part 1 covers layered media, and part 2 covers fractured media. Project 2, Supersaturation, critical saturation and residual gas saturation in porous media, investigates the solution gas-drive process in heavy and light oil reservoirs. The third project studies the waterflood performance of tight rock in fractured and layered reservoirs.

7207 (DOE/BC/14881–9) **Improving reservoir conformance using gelled polymer systems. Quarterly progress report, July 1–September 30, 1994.** Green, D.W.; Willhite, G.P. Kansas Univ. Center for Research, Inc., Lawrence, KS (United States). 1 Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14881. Order Number DE95005346. Source: OSTI; NTIS; GPO Dep.

The general objectives are to (1) to identify and develop gelled polymer systems which have potential to improve reservoir conformance of fluid displacement processes, (2) to determine the performance of these systems in bulk and in porous media, and (3) to develop methods to predict the capability of these systems to recover oil from petroleum reservoirs. This work focuses on three types of gel systems an aqueous polysaccharide (KUSP 1) system that gels as a function of pH, the chromium(III)-polyacrylamide system and the aluminum citratepolyacrylamide system. Laboratory research is directed at the fundamental understanding of the physics and chemistry of the gelation process in bulk form and in porous media. This knowledge will be used to develop conceptual and mathematical models of the gelation process. Mathematical models will then be extended to predict the performance of gelled polymer treatments in oil reservoirs. Technical progress is described for three studies: Physical and chemical characterization of gel systems (chemical reaction kinetics of KUSP1); Mechanisms of in situ gelation; and Mathematical modeling of gel systems.

7208 (DOE/BC/14883–8) **Surfactant-enhanced alkaline flooding for light oil recovery. Quarterly report, April 1–June 30, 1994.** Wasan, D.T. Illinois Inst. of Tech., Chicago, IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14883. Order Number DE95005370. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to develop a very cost-effective method for formulating a successful surfactant-enhanced alkaline flood by appropriately choosing mixed alkalis which form inexpensive buffers to obtain the desired pH (between 8.5 and 12.0) for ultimate spontaneous emulsification and ultra-low tension. In addition, the novel concept of pH gradient design to optimize flood water conditions will be tested.

7209 (DOE/BC/14883–9) **Surfactant-enhanced alkaline flooding for light oil recovery. Quarterly report, July 1–September 30, 1994.** Wasan, D.T. Illinois Inst. of Tech., Chicago, IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14883. Order Number DE95005371. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to develop a very cost-effective method for formulating a successful surfactant-enhanced alkaline flood by appropriately choosing mixed alkalis which form inexpensive buffers to obtain the desired pH (between 8.5 and 12.0) for ultimate spontaneous emulsification and ultra-low tension. In addition, the novel concept of pH gradient design to optimize flood water conditions will be tested.

7210 (DOE/BC/14884–9) **Surfactant loss control in chemical flooding: Spectroscopic and calorimetric study of adsorption and precipitation on reservoir minerals. Quarterly technical progress report, April 1, 1994–June 30, 1994.** Somasundaran, P. Columbia Univ., New York, NY (United States). 31 Aug 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14884. Order Number DE95005358. Source: OSTI; NTIS; GPO Dep.

The aim of this contract is to elucidate the mechanisms underlying adsorption and surface precipitation of flooding surfactants on reservoir minerals. Effect of surfactant structure, surfactant combinations and other inorganic and polymeric species will also be determined. Solids of relevant mineralogy and a multi-pronged approach consisting of micro & nano spectroscopy, microcalorimetry, electrokinetics, surface tension and wettability will be used to achieve the goals. The results of this study should help in controlling surfactant loss in chemical flooding and also in developing optimum structures and conditions for efficient chemical flooding processes.

7211 (DOE/BC/14884–10) **Surfactant loss control in chemical flooding: Spectroscopic and calorimetric study of adsorption and precipitation on reservoir minerals. Quarterly technical progress report, July 1, 1994–October 31, 1994.** Somasundaran, P. Columbia Univ., New York, NY (United States). 1 Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14884. Order Number DE95005359. Source: OSTI; NTIS; GPO Dep.

Interactions between surfactants and solids can be understood completely by studying desorption as well as adsorption. During this report period, desorption of tetradecyl trimethyl ammonium chloride (TTAC) and pentadecylethoxylated nonyl phenol (NP-15) mixtures from the alumina-water interface was studied. It was found that in tetradecyl trimethyl ammonium chloride (TTAC) rich mixtures the desorption of the two surfactants from the interface was controlled by the TTAC and was similar to the desorption of TTAC alone. At high concentrations the adsorption of the mixtures was reversible. At low concentrations, however, the desorption of TTAC showed some positive hysteresis. Since the adsorption of NP-15 was dependent upon the presence of TTAC, polyethoxylated nonyl phenol (NP-15) also, like TTAC, showed some positive desorption hysteresis. In contrast, the desorption of both these surfactants from a 1:1 TTAC:NP-15 mixture showed some negative hysteresis. It was clear that the desorption behavior of the components in the mixture system studied here can be controlled by adjusting the ratio of the two surfactants. With an increase of NP-15 in the mixtures, the desorption of surfactants becomes easier. In an attempt to understand adsorption and desorption behavior of mixed surfactant systems, regular solution theory was used to model the interactions between tetradecyl trimethyl ammonium chloride (TTAC) and nonyl phenol polyethoxylated alcohol with fifteen ethylene oxide groups (NP-15). The interaction parameter P and the monomer concentrations were calculated for different mixtures.

7212 (DOE/BC/14891–4) **Interdisciplinary study of reservoir compartments. Quarterly technical progress report, July 1, 1994–September 30, 1994.** Van Kirk, C.W. Colorado School of Mines, Golden, CO (United States). 28 Oct 1994. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14891. Order Number DE95005339. Source: OSTI; NTIS; GPO Dep.

This DOE research project was established to document the integrated team approach for solving reservoir engineering problems. A field study integrating the disciplines of geology, geophysics, and petroleum engineering will be the mechanism for documenting the integrated approach. This is an area of keen interest to the oil and gas industry. The goal will be to provide tools and approaches that can be used to detect reservoir compartments, reach a better reserve estimate, and improve profits early in the life of a field.

7213 (DOE/BC/14951–8) **Integrated approach towards the application of horizontal wells to improve waterflooding performance. Quarterly technical progress report, July 1–September 30, 1994.** Kelkar, M.G.; Liner, C.; Kerr, D. Tulsa Univ., OK (United States). [1994]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14951. Order Number DE95005330. Source: OSTI; NTIS; GPO Dep.

The overall purpose of the proposed project is to improve secondary recovery performance of a marginal oil field through the use of a horizontal injection well. The location and direction of the well will be selected based on the detailed reservoir description using integrated approach. The authors expect that 2 to 5% of original oil in place will be recovered using this method. This should extend the life of the reservoir by at least 10 years. The overall report is divided into three sections. In the first section, the authors discuss the new results based on the cross bore hole seismic surveys. In the second section, they discuss the geological description of the Self Unit based on Formation Microscanner Imaging (FMI) analysis. In the last section, they present the flow simulation results under different scenarios followed by the economic evaluation. Based on their economic evaluation they believe that drilling a horizontal injectional well may not be a viable option under the present oil price scenario.

7214 (DOE/BC/14952–10) **Secondary oil recovery from selected Carter sandstone oilfields–Black Warrior Basin, Alabama. Final report.** Anderson, J.C. Anderman/Smith Operating Co., Denver, CO (United States). Feb 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14952. Order Number DE95000125. Source: OSTI; NTIS; GPO Dep.

Producibility problems, such as low reservoir pressure and reservoir heterogeneity, have severely limited oil production from the Central Bluff and North Fairview fields. Specific objectives for this project were: To successfully apply detailed geologic and engineering studies with conventional waterflood technologies to these fields in an effort to increase the ultimate economic recovery of oil from Carter sandstone fields; To extensively model, test and evaluate these technologies; thereby, developing a sound methodology for their use and optimization; and To team with Advanced Resources International and the US DOE to assimilate and transfer the information and results gathered from this study to other oil companies to encourage the widespread use of these technologies. At Central Bluff, water injection facilities were constructed and water injection into one well began in January 1993. Oil response from the waterflood has been observed at both producing wells. One of the producing wells has experienced early water breakthrough and a concomitant drop in secondary oil rate. A reservoir modeling study was initiated to help develop an appropriate operating strategy for Central Bluff. For the North Fairview unit waterflood, a previously abandoned well was converted for water injection which began in late June 1993. The reservoir is being repressurized, and unit water production has remained nil since flood

start indicating the possible formation of an oil bank. A reservoir simulation to characterize the Carter sand at North Fairview was undertaken and the modeling results were used to forecast field performance. The project was terminated due to unfavorable economics. The factors contributing to this decision were premature water breakthrough at Central Bluff, delayed flood response at North Fairview and stalled negotiations at the South Bluff site.

7215 (DOE/BC/14954–8) **Improved secondary recovery demonstration for the sooner unit. 3rd Quarter technical report, calendar year 1994, June 1, 1994–September 30, 1994.** Diversified Operating Corp., New Raymer, CO (United States). 31 Jul 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14954. Order Number DE95005360. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to demonstrate the effectiveness of geologically targeted infill drilling and improved reservoir management to obtain maximum oil recovery from the Sooner Unit in the Denver-Julesburg (D-J) Basin. The Sooner Unit Field is located about 100 miles northeast from Denver, Colorado and produces from the fluvial-deltaic Cretaceous "D" Sand formation at an average depth of 6,200 ft. The first phase of the project will involve multi-disciplinary reservoir characterization and recovery identification in which high-density 3-D seismic, detailed stratigraphy and engineering analysis will be used to identify optimum infill well sites and production/withdrawal schedules. One well will be drilled during this phase to obtain data pertinent to seismic activities. The second phase will involve implementation of the selected technologies by drilling geologically targeted infill wells and establishing production/injection schedules. Evaluation of results from the second phase will be performed using reservoir simulation, transient well tests and careful production tests of producing wells. The objective will be to compare the prediction of ultimate recovery resulting from the implementation of these technologies with that which would have occurred in the absence of these technologies. The success of this project and effective technology transfer should prompt-re-appraisal of older waterflood projects and implementation of new projects in oil provinces such as the D-J Basin.

7216 (DOE/BC/14958–T2) **Green River Formation water flood demonstration project, Uinta Basin, Utah. Quarterly technical progress report, July 1–September 30, 1994.** Lomax, J.D. (Lomax Exploration Co., Salt Lake City, UT (United States)); Nielson, D.L.; Deo, M.D. Lomax Exploration Co., Salt Lake City, UT (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14958. Order Number DE95005322. Source: OSTI; NTIS; GPO Dep.

The project is designed to increase recoverable petroleum reserves in the United States. The Green River Formation in Utah's Uinta Basin contains abundant hydrocarbons that are not easily recovered by primary means. The successful Lomax Monument Butte Unit water flood will be evaluated under this contract, and based on this information, water floods will be initiated in nearby Travis and Boundary units. In 1987, Lomax Exploration Company started a water flood in the Monument Butte Unit of a Douglas Creek member of the Green River Formation. This was a low-energy, geologically heterogeneous reservoir producing a waxy crude oil. Primary production yielded about 5% of the OOIP. Due to the water flood project, total production will yield an estimated recovery of 20% OOIP. Technical progress is reported on field activities at the Monument Butte unit and the Travis unit; geologic characterization of the stratigraphy of the Travis, Monument Butte, and Boundary areas; and reservoir simulations of the Travis unit.

7217 (DOE/BC/14960–6) **Post waterflood CO_2 miscible flood in light oil, fluvial - dominated deltaic reservoirs. Technical progress report, 4th quarter, fiscal year 1994, July 1, 1994–September 30, 1994.** Texaco Exploration and Production, Inc., New Orleans, LA (United States). 15 Oct 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14960. Order Number DE95005367. Source: OSTI; NTIS; GPO Dep.

Production from the Port Neches project has reached a new high of 500 BOPD, as shown. Production from several wells has improved after changing WAGer and CO_2 injection patterns. The WAG process appears to be effective in FDD reservoirs. The WAT process has improved the oil production rates and simultaneously decreased the CO_2 production rates from wells with high GOR. Material balance calculations indicate that the reservoir pressure remained relatively flat, and a new BHP will be taken this month to verify the calculations. Total CO_2 injection is averaging about 9.5 MMCFD, including 3.9 MMCFD purchased from Cardox, as shown, and the balance is recycled from the producing wells. Over 50% of the gas was produced from one well, Khun No. 33. A CO_2 injection line was installed to huff-puff well Khun No. 6 that did not respond yet to CO_2 injection in well Khun No. 17. After injecting a limited CO_2 volume in well Khun No. 6, this will be followed by a short shut-in period, then the well will be placed on production.

7218 (DOE/BC/14963–4) **West Hackberry Tertiary Project. Quarterly technical progress report, June 3, 1994–September 2, 1994.** Gillham, T.H. Amoco Production Co., Houston, TX (United States). 31 Aug 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14963. Order Number DE95005368. Source: OSTI; NTIS; GPO Dep.

The goal of the West Hackberry Tertiary Project is to demonstrate the technical and economic feasibility of combining air injection with the Double Displacement Process for tertiary oil recovery. The Double Displacement Process is the gas displacement of a water invaded oil column for the purpose of recovering oil through gravity drainage. The novel aspect of this project is the use of air as the injection fluid. The target reservoir for the project is the Camerina C-1,2,3 Sand located on the West Flank of West Hackberry Field in Cameron Parish, Louisiana. If successful, this project will demonstrate that the use of air injection in the Double Displacement Process can economically recover oil in reservoirs where tertiary oil recovery is presently uneconomic.

7219 (DOE/BC/14963–6) **West Hackberry tertiary project. Quarterly technical progress report, September 3, 1994–December 2, 1994.** Gillham, T.; Cerveny, B.; Turek, E. Amoco Production Co., Houston, TX (United States). 30 Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14963. Order Number DE95005369. Source: OSTI; NTIS; GPO Dep.

The goal of the West Hackberry Tertiary Project is to demonstrate the technical and economic feasibility of combining air injection with the Double Displacement Process for tertiary oil recovery. The Double Displacement Process is the gas displacement of a water invaded oil column for the purpose of recovering oil through gravity drainage. The novel aspect of this project is the use of air as the injection fluid. The target reservoir for the project is the Camerina C-1,2,3 Sand located on the West Flank of West Hackberry Field in Cameron Parish, Louisiana. If successful, this project will demonstrate that the use of air injection in the Double Displacement Process can economically recover oil in reservoirs where tertiary oil recovery is presently uneconomic. The target reservoir has not produced since January of 1993 when the last of the reservoir's producing wells watered out.

7220 (DOE/BC/14977–1) **Improved efficiency of miscible CO_2 floods and enhanced prospects for CO_2 flooding heterogeneous reservoirs. Quarterly technical progress report, April 14, 1994–June 30, 1994.** Grigg, R.B.; Heller, J.P.; Schechter, D.S. New Mexico Inst. of Mining and Technology, Socorro, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94BC14977. (PRRC–94-26). Order Number DE95005318. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to improve the effectiveness of CO_2 flooding in heterogeneous reservoirs. The intent is to investigate new concepts that can be applied by field operators within the next two to five years. Activities will consist of experimental research in three closely related areas: (1) further exploration of the applicability of selective mobility reduction (SMR) in the use of foam flooding, (2) possible higher economic viability of floods at slightly reduced CO_2 injection pressures, and (3) taking advantage of gravitational forces during low IFT, CO_2 flooding in tight, vertically fractured reservoirs.

7222 (DOE/BC/14983–2) **Recovery of bypassed oil in the Dundee Formation using horizontal drains. Quarterly report, 4th quarter, FY 1994.** Wood, J.R. Michigan Technological Univ., Houghton, MI (United States). Oct 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14983. Order Number DE95005341. Source: OSTI; NTIS; GPO Dep.

Well data, including drillers' logs, wireline logs, and seismic data, from the Crystal and other Dundee hydrocarbon fields in the Michigan basin, have been acquired. Digitized logs of 342 wells that currently produce or have produced from the Dundee Formation in the seven-county study area have been purchased from Maness Petroleum Company. Multiple logs exist for each well, and include gamma ray, caliper, lithodensity, neutron porosity, various types of resistivity, and some sonic logs. Twenty to thirty cores of the Dundee Formation from throughout the state of Michigan are currently available. Cuttings samples are also available from 60 to 100 Michigan wells. The storage locations of many of these core and cuttings samples have been identified, but sampling has not yet begun. A well has been designed and permitted and will soon be drilled. This well will have both a horizontal and a vertical leg. The vertical leg well will be cored through the producing interval of the Dundee Formation and the cores will be analyzed for porosity, permeability, and fluid saturations. A full set of well logs will be run, including gamma ray, porosity, resistivity, and geochemistry logs. This data will be incorporated into the existing database for the project area and used to calibrate the MWD (Measurement While Drilling) logs which will be run during the drilling of the horizontal leg. The horizontal leg will be drilled as a sidetrack from the vertical test well. If commercial amounts of hydrocarbons are encountered, the horizontal well will be placed on production. Drilling is expected to commence in late 1994 or early 1995, after completion of an environmental survey.

7223 (DOE/BC/14984–1) **Improved recovery demonstration for Williston Basin carbonates. Quarterly report, June 1–September 30, 1994.** Luff Exploration Co., Denver, CO (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14984. Order Number DE95005314. Source: OSTI; NTIS; GPO Dep.

The purpose of this project is to demonstrate targeted infill and extension drilling opportunities, better determinations of oil in place, methods for improved completion efficiency and the suitability of waterflooding in certain shallow-shelf carbonate reservoirs in the Williston Basin, Montana, North Dakota and South Dakota. The majority of technical efforts during the first quarter have been concentrated on the Ordovician Red River formation in Bowman and Harding counties of North and South Dakota. The Cold Turkey Creek field area has been identified as the most suitable candidate for a 3-D seismic survey. Approximately 145 km of 1970's and 1980's vintage 2-D seismic data in Bowman county, N.D. have been cataloged for possible reprocessing. Reprocessing of these older data has been successful for 14 lines over 56 km. A 2-D seismic line has been shot over the SW Amor field area. This high-fold line is a prelude to 3-D survey design parameters and better understanding of a candidate Red River reservoir for testing water injectivity and possible unitization for secondary recovery by waterflooding. Seismic modeling of seismic shear response has begun for the Ratcliffe study area in Richland county, Montana. Secondary recovery operations by water injection and reservoir parameters have been studied by history matching using computer simulation at the West Buffalo Red River B Unit, Harding county, S.D. Results obtained from the West Buffalo history match were applied to a waterflood prediction by computer simulation for the SW Amor field. Reservoir performance parameters for volumetric drainage, transmissibility and water-drive index have been evaluated using Fetkovitch production type-curves for a sampling of Red River wells in N.D.

7224 (DOE/BC/14986–2) **CO_2 Huff-n-Puff process in a light oil shallow shelf carbonate reservoir. Quarterly technical progress report, 3rd quarter, 1994.** Wehner, S.; Smith, V.; Cole, R.; Brugman, B.; Vogt, J. Texaco Exploration and Production, Inc., Midland, TX (United States). 18 Oct 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14986. Order Number DE95005349. Source: OSTI; NTIS; GPO Dep.

The principal objective of the Central Vacuum Unit (CVU) CO_2 Huff-n-Puff (H-n-P) project is to determine the feasibility and practicality of the technology in a waterflooded shallow shelf carbonate environment. The results of parametric simulation of the CO_2 H-n-P process, coupled with the CVU reservoir characterization components will determine if this process is technically and economically feasible for field implementation. The technology transfer objective of the project is to disseminate the knowledge gained through an innovative plan in support of the Department of Energy's (DOE) objective of increasing domestic oil production and deferring the abandonment of shallow shelf carbonate (SSC) reservoirs. Texaco Exploration and Production Inc's. (TEPI) long-term plans are to implement a full-scale miscible CO_2 project in the CVU. However, the current market precludes acceleration of such a capital intensive project. The DOE partnership provides some relief to the associated R and D risks, allowing TEPI to evaluate a proven Gulf-coast sandstone technology in a waterflooded carbonate environment. Technical progress is described on the following studies: Porosity and permeability relationships; Initial water saturation and oil-water contact; Geostatistical realization; and Parametric simulation.

7225 (DOE/BC/14990–1) **Application of reservoir characterization and advanced technology to improve recovery and economic in a lower quality shallow shelf carbonate reservoir. Third quarter 1994, August 3, 1994–September 30, 1994.** Oxy USA, Inc., Welch, TX (United States). 25 Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14990. Order Number DE95005355. Source: OSTI; NTIS; GPO Dep.

The focus of the project is to show that the use of advanced technology can improve the economics of CO_2 projects in low permeability reservoirs. The approach involves the use of tomography and pore throat measurements to enhance reservoir characterization. Cyclic CO_2 stimulations and fracture treatment will be used to increase and facilitate oil recovery to improve project economics. Reservoir description and simulation will be used along with cyclic CO_2 stimulations and fracture treatments to arrive at optimum operating plan to be instituted during the second budget period. Official start-up of the project was August 3, 1994 so September 30, 1994 represents the end of the first quarter. However, work in the area of cyclic CO_2 stimulation and reservoir characterization had taken place prior to this quarter under preaward approval. Objectives to be accomplished during the first quarter included: (1) obtaining petrophysical data, (2) preparation for drilling two observation wells, (3) designing and preparing for tomographic surveys, (4) adding injection surveys to petrophysical database, (5) initiating work on interpreting existing seismic surveys and using results to develop a relationship with petrophysical characterization, (6) began cyclic CO_2 stimulation treatments.

7226 (DOE/MT/93007–4) **Surfactant development for enhanced oil recovery. Fourth quarterly report, July 1, 1994–September 30, 1994.** Morgan State Univ., Baltimore, MD (United States). Sep 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93MT93007. Order Number DE95005378. Source: OSTI; NTIS; GPO Dep.

The objective of this report is to develop surfactant systems(s) that will be suitable for enhanced oil recovery. The developed system will be expected to be stable at high temperatures and exhibit high salinity tolerance.

7227 (NIPER/BDM–0086) **Field application of in situ combustion – past performance/future application: Proceedings.** Sarathi, P. (BDM Oklahoma, Inc., Bartlesville, OK (United States)); Olsen, D. BDM Oklahoma, Inc., Bartlesville, OK (United States); National Inst. for Petroleum and Energy Research, Bartlesville, OK (United States). Feb 1995. 248p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-94PC91008. (CONF-940450–: Field application in situ combustion practices: past, present and future applications, Tulsa, OK (United States), 21-22 Apr 1994). Order Number DE95000130. Source: OSTI; NTIS; GPO Dep.

The contents of this volume represent the collective presentations at a symposium, entitled "Field Application of in Situ Combustion–Past Performance/Future Application," which was held in Tulsa, Oklahoma, April 21–22,1994. This symposium was sponsored by the US Department of Energy (DOE) as part of its technology transfer mission and was organized by BDM-Oklahoma Inc., the management and operation contractor of DOE's National Institute for Petroleum and Energy Research (NIPER). A total of 14 technical papers were presented at the symposium and are included in these Conference Proceedings. These proceedings also included the keynote speaker's address and ensuing discussion along with the summary of panel presentations and discussion. For convenience, the proceedings are assembled into five parts, each containing related materials. The first part includes the six papers presented at the "Technology Assessment" session, followed by the papers discussion section. The second part includes all the papers presented at the "Laboratory Studies" session followed by the papers discussion section. The third part includes the five papers and the ensuing discussion that transpired during the "Case Histories" session. This section also includes a full text of one of the panel member's presentation (Paper ISC-14). The fourth part includes a summary of the panel presentation, and the discussion section. The final part includes the full text of they keynote speaker's address and the ensuing discussion. The papers are included in the order in which they were presented, and the discussion section includes selected questions posed by the audience to the speakers and their responses. Selected papers have been processed separately for inclusion in the Energy Science and Technology Database.

7228 (DOE/MT/92020–8) **Improvement of hydrogen solubility and entrainment in hydrocracker feedstocks. Quarterly technical report, July 1, 1994–September 30, 1994.** Kabadi, V.N. North Carolina Agricultural and Technical State Univ., Greensboro, NC (United States). Dept. of Chemical Engineering. [1995]. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92MT92020. Order Number DE95005313. Source: OSTI; NTIS; GPO Dep.

A thermodynamic model has been developed to predict the solubility of hydrogen in petroleum fractions. The model for solubility of hydrogen in hydrocarbons is developed from the experimental data at temperatures up to 300°C and pressures up to 120 atmospheres, and is based on the method of Sander and et al. It includes an expression for Henry's Law constants for hydrogen in a reference solvent as a function of temperature, the virial equation of state for the vapor and modified UNIFAC correlation for activity coefficients in the liquid phase. Three hydrocarbons are used as the reference solvent, suitable correlations for pures and mixtures, and binary group interaction parameters required in the modified UNIFAC correlation are regressed as functions of temperature using experimental solubility data over a wide range of temperatures. The predicted solubility results are compared with experimental data and it is shown that this model provides a generalized method for hydrogen solubility in hydrocarbon solvents over a much wider range of temperatures and pressures than any other model available. The model will be extended for hydrogen solubility prediction in petroleum fractions using an approximate method for petroleum fraction characterization into molecular weight distributions and functional group compositions. Solubility is computed using the method of continuous thermodynamics. The most significant results of this work is a computer package for computation of hydrogen solubility in petroleum fractions at advanced temperatures and pressures which should be very valuable in the design of hydrocracking operation.

7229 (DOE/PC/90057–T10) **The selective catalytic cracking of Fischer-Tropsch liquids to high value transportation fuels. Quarterly technical progress report No. 5, first quarter fiscal year 1993, October 1, 1992–December 31, 1992.** Reagan, W.J. Amoco Oil Co., Naperville, IL (United States). Research and Development Dept. [1995]. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90057. Order Number DE95005518. Source: OSTI; NTIS; GPO Dep.

Amoco Oil Company, under a contract with the United States Department of Energy, is investigating a selective catalytic cracking process to convert the Fischer-Tropsch gasoline and wax fractions to high value transportation fuels. This report describes the work in the first quarter, fiscal year, 1993.

7230 (DOE/PC/90057–T11) **The selective catalytic cracking of Fischer-Tropsch liquids to high value transportation fuels. Quarterly technical status report for first quarter fiscal year, 1994 - report No. 41, October 1, 1993–December 31, 1993.** Schwartz, M.M. Amoco Oil Co., Naperville, IL (United States). Research and Development Dept. [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90057. Order Number DE95005519. Source: OSTI; NTIS; GPO Dep.

Amoco Oil Company, under a contract with the United States Department of Energy, is investigating a selective catalytic cracking process to convert the Fischer-Tropsch gasoline and wax fractions to high value transportation fuels. Characterization of the IBP-430, 430-650, and 650+ °F fractions of the three pilot plant runs that were made in August, 1993 was completed. Sasol wax was the feedstock for those runs. The catalysts used were 10% steamed USY, 10% steamed Beta, and standard equilibrium USY. A comparison of the economics for using Fischer-Tropsch wax as feedstock for hydrocracking versus catalytic cracking processes was performed. Hydrocracker values are similar to FCC product values for a simple refinery configuration (no Ether Unit). Hydrocracker values are less than FCC product values for a complex refinery configuration (contains Ether Unit). The work in this area is now complete.

7231 (PNL-SA–24557) **New nanophase iron-based catalysts for hydrocracking applications.** Matson, D.W.; Linehan, J.C.; Darab, J.G.; Camaioni, D.M.; Autrey, S.T.; Lui, E. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941144–25: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004942. Source: OSTI; NTIS; GPO Dep.

Development of highly efficient iron-based materials for processes involving carbon-carbon bond cleavage, including petroleum hydrocracking and coal liquefaction, offers the potential for decreasing catalyst costs as well as reducing the need for expensive catalyst recovery and recycling steps. Carbon-carbon bond cleavage catalysts produced in situ at reaction conditions from nanocrystalline hydrated iron oxides, show high activity and selectivity in model compound studies. Two highly active catalyst precursors, ferric oxyhydroxysulfate (OHS) and 6-line ferrihydrite, can be produced by a flow-through hydrothermal powder synthesis method, the Rapid Thermal Decomposition of precursors in Solution (RTDS) process. Model compound studies indicate that both catalyst precursors are active at a 400 C reaction temperature, but that there are significant differences in their catalytic characteristics. The activity of 6-line ferrihydrite is highly dependent on the particle (aggregate) size whereas the activity of the OHS is essentially independent of particle size. These differences are attributed to variations in the crystallite aggregation and particle surface characteristics of the two catalyst precursor materials. Catalytic activity is retained to lower reaction temperatures in tests using OHS than in similar tests using 6-line ferrihydrite.

7232 (DOE/EIA–0380(95/01)) **Petroleum marketing monthly: January 1995, with data for October 1994.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. Jan 1995. 186p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005610. Source: OSTI; NTIS; GPO; GPO Dep.

The Petroleum Marketing Monthly (PMM) provides information and statistical data on a variety of crude oils and refined petroleum products. The publication presents statistics on crude oil costs and refined petroleum products sales for use by industry, government, private sector analysts, educational institutions, and consumers. Data on crude oil include the domestic first purchase price, the f.o.b. and landed cost of imported crude oil, and the refiners' acquisition cost of crude oil. Refined petroleum product sales data include motor gasoline, distillates, residuals, aviation fuels, kerosene, and propane. The Petroleum Marketing Division, Office of Oil and Gas, Energy Information Administration ensures the accuracy, quality, and confidentiality of the published data in the Petroleum Marketing Monthly.

7233 (DOE/EIA–0487(93)) **Petroleum marketing annual 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. Jan 1995. 412p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005364. Source: OSTI; NTIS; INIS; GPO Dep.

The Petroleum Marketing Annual (PMA) contains statistical data on a variety of crude oils and refined petroleum products. The publication provides statistics on crude oil costs and refined petroleum products sales for use by industry, government, private sector analysts, educational institutions, and consumers. Data on crude oil include the domestic first purchase price, the free-on-board (f.o.b.) and landed cost of imported crude oil, and the refiners acquisition cost of crude oil. Sales data for motor gasoline, distillates, residuals, aviation fuels, kerosene, and propane are presented. For this publication, all estimates have been recalculated since their earlier publication in the Petroleum Marketing Monthly (PMM). These calculations made use of additional data and corrections that were received after the PMM publication dates.

7234 (DOE/EIA–0520(95/01)) **International petroleum statistics report.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. Jan 1995. 73p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005790. Source: OSTI; NTIS; GPO; GPO Dep.

This monthly publication provides current data on international oil production, demand, imports, exports, and stocks. Section 1 contains time series data on world oil production, and on oil demand and stocks in the OECD. Section 2 presents an oil supply/demand balance for the world. Section 3 presents data on oil imports by OECD countries. Section 4 presents annual time series data on world oil production and oil stocks, demand, and trade in OECD countries.

7235 (DOE/EIA–0538(94/95-14)) **Winter fuels report.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 13 Jan 1995. 77p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005366. Source: OSTI; NTIS; INIS; GPO Dep.

The Winter Fuels Report is intended to provide concise, timely information to the industry, the press, policymakers, consumers, analysts, and State and local governments on the following topics: distillate fuel oil net production, imports and stocks on a US level and for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; propane net production, imports and stocks on a US level and for PADD's I, II, and III; natural gas supply and disposition and underground storage for the US and consumption for all PADD's, as well as selected National average prices; residential and wholesale pricing data for heating oil and propane for those States participating in the joint Energy Information Administration (EIA)/State Heating Oil and Propane Program; crude oil and petroleum price comparisons for the US and selected cities; and a 6-10 day, 30-Day, and 90-Day outlook for temperature and precipitation and US total heating degree-days by city.

7236 (DOE/EIA–M059/A) **Documentation of the petroleum market model (PMM). Appendix: Model developer's report.** USDOE Energy Information Administration, Washington, DC (United States). Energy Supply and Conversion Div. 28 Dec 1994. 34p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006081. Source: OSTI; NTIS; INIS; GPO Dep.

The Office of Integrated Analysis and Forecasting (OIAF) is required to provide complete model documentation to meet the EIA Model Acceptance Standards. The EIA Model Documentation: Petroleum Market Model of the National Energy Modeling System provides a complete description of the Petroleum Market Model's (PMM) methodology, and relation to other modules in the National Energy Modeling System (NEMS). This Model Developer's Report (MDR) serves as an appendix to the methodology documentation and provides an assessment of the sensitivity of PMM results to changes in input data. The MDR analysis for PMM is performed by varying several sets of input variables one-at-a-time and examining the effect on a set of selected output variables. The analysis is based on stand-alone, rather than integrated, National Energy Modeling System (NEMS) runs. This means that other NEMS modules are not responding to PMM outputs. The PMM models petroleum refining and marketing. The purpose of the PMM is to project petroleum product prices, refining activities, and movements of petroleum into the United States and among domestic regions. In addition, the PMM estimates capacity expansion and fuel consumption in, the refining industry. The PMM is also used to analyze a wide variety of petroleum-related issues and policies, in order to foster better understanding of the petroleum refining and marketing industry and the effects of certain policies and regulations. The PMM simulates the operation of petroleum refineries in the United States, including the supply and transportation of crude oil to refineries, the regional processing of these raw materials into petroleum products, and the distribution of petroleum products to meet regional demands. The essential outputs of this model are product prices, a petroleum supply/demand balance, demands for refinery fuel use, and capacity expansion.

7237 (DOE/IE/10859–T4) **Iran's petroleum policy: Current trends and the future outlook.** Pezeshki, S.; Fesharaki, F. East-West Center, Honolulu, HI (United States). Dec 1994. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-90IE10859. Order Number DE95004466. Source: OSTI; NTIS; INIS; GPO Dep.

The Iranian economy and political situation have undergone radical changes since the 1979 Islamic revolution. The excesses of the early years of the revolution have gradually given way to moderation and a more pragmatic economic policy–based on the principles of the free market. The petroleum policy, as a subset of the economic policies, has been somewhat affected by the political and economic developments in Iran. The petroleum policy has changed from a position of no foreign participation to a position that includes a desire for foreign participation, the text of a model contract, and an attempt to introduce new technologies in the upstream sector. This report provides an overview of the key issues facing the Iranian oil industry and the economic context in which the oil industry is operating in Iran. It describes the evolution of policies meant to move the oil industry toward the free market; it discusses Iran's oil trading partners, the outlook for refining and project investments, and current and likely future developments in the natural gas and petrochemical sectors. In short, the report provides an up-to-date assessment of the Iranian petroleum sector and its likely evolution in the future.

7238 (SR/OOG–94-03) **The Energy Information Administration's assessment of reformulated gasoline: An update.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. Dec 1994. 38p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004836. Source: OSTI; NTIS; INIS; GPO Dep.

This report (Part II) concludes a two part study of The Energy Information Administration's (EIA) assessment of Reformulated Gasoline (RFG). The data contained herein updates EIA's previous findings and analyses on reformulated gasoline as it affects the petroleum industry. The major findings of Part II have not changed considerably from Part I: Supplies of RFG are adequate to meet demand, but a tight supply-demand balance exists, leaving the RFG system with little ability to absorb unexpected supply or delivery system disruption. In December 1994, the estimated demand for RFG was 2.6 million barrels per day, with the production capability just meeting this demand. The study concludes that current prices for RFG are consistent with the costs underlying the product, and the difference in RFG and conventional gasoline indicates confidence in supply. The study also follows the impact of recent events such as: postponement of the Renewable Oxygenate Standard, the decision to require importers to use the U.S. average baseline for limiting emissions, the disruption of the Colonial Pipeline in Texas, and Pennsylvania's request to opt-out of the RFG program.

7239 (DOE/MT/92008–9) **Development of a cost effective environment compliance technology for stripper brine wells. Quarterly report, July 1, 1994–September 30, 1994.** Adewumi, M.A.; Watson, R.W. Pennsylvania State Univ., University Park, PA (United States). 7 Nov 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92008. Order Number DE95005380. Source: OSTI; NTIS; GPO Dep.

The specific objective of the research is to demonstrate that the characteristics of wastewater from stripper oil wells and marginal gas wells are sufficiently similar to be treated under a standardized treatment methodology, that the environmental impacts of the discharge of treated brines from both stripper oil and marginal gas wells can be adequately regulated, and that the inclusion of marginal gas wells in the same category as stripper oil wells is appropriate, especially for wells operating in the Appalachian Basin.

7240 (DOE/MT/92009–9) **Evaluation of the freeze-thaw/evaporation process for the treatment of produced waters. Quarterly technical progress report, July 1, 1994–September 30, 1994.** Boysen, J.; Morotti, J. Resource Technology Corp., Laramie, WY (United States). Jul 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92009. Order Number DE95005383. Source: OSTI; NTIS; GPO Dep.

The use of freeze-crystallization is being increasingly acknowledged as a low-cost, energy-efficient method for purifying contaminated water. Freeze-crystallization has been shown to be effective in removing a wide variety of contaminants from water. Water purification by using natural conditions to promote freezing appears to be an extremely attractive process for the treatment of contaminated water in many areas where natural climatic conditions will seasonally promote freezing. The natural freezing process can be coupled with natural evaporative processes to treat oil and gas produced waters year round in regions where subfreezing temperatures seasonally occur. The objectives of this research are related to development of a commercially-economic natural freeze-thaw/evaporation (FTE) process for the treatment and purification of water produced in conjunction with oil and gas.

Source: OSTI; NTIS (US Sales Only); INIS.

Extraction from fluid deposits leads to later compaction of the porous supporting rock. The cause of this is a change of pressure in the deposit, which depends on the rate and conditions of extraction. The phenomenon of so-called compaction changes the rock mechanics conditions and causes movements of rock and the ground. Many samples show that considerable damage to extraction plant and bores can be caused by the ground movement. To prevent or to minimize these problems, one can take certain technical measures which must, however, be based on a knowledge of compaction and ground movement. This article examines the effect of compaction on the process of movement at the surface or at the bottom of the sea. A critical analysis of previously known methods of calculation leads to the result that further work on the pre-calculation of compaction and subsidence movements above fluid deposits is necessary. From this, a method of calculation is developed and applied to a large natural gas deposit. (orig.)

0210 Legislation and Regulations

7242 (NYSERDA–94-18) **Reformulated gasoline study, executive summary.** Cunningham, R.E. (Turner, Mason & Co., Dallas, TX (United States)); Michalski, G.W.; Baron, R.E.; Lyons, J.M. New York State Energy Research and Development Authority, Albany, NY (United States); Turner, Mason and Associates, Dallas, TX (United States); DRI/McGraw-Hill, Lexington, MA (United States); Sierra Research, Inc., Sacramento, CA (United States). Oct 1994. 45p. Source: OSTI; New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223.

The feasibility of adopting alternative standards for reformulated gasoline (RFG) in New York State has been studied for the New York State Energy Research and Development Authority (the Energy Authority). In addition to Federal RFG (EPA 1) and EPA II, California Air Resources Board RFG (CARB 2) and a modified Federal low sulfur RFG (LS-EPA II) were investigated. The effects of these alternative RFGs on petroleum refinery gasoline production costs, gasoline distribution costs, New York State air quality and the New York State economy were considered. New York has already adopted the California low emission vehicle (LEV) and other emission control programs that will affect vehicles and maintenance. From 1998 to 2012 without the introduction of any type of RFG, these programs are estimated to reduce New York State mobile source summer emissions by 341 tons per day (or 40%) of non-methane hydrocarbons (NMHC) and by 292 tons per day (or 28%) of nitrogen oxides (NO_x), and to reduce winter emissions of carbon monoxide (CO) by 3,072 tons per day (or 39%). By 2012, the planned imposition of Federal RFG will produce further reductions (percent of 1998 levels) of 10 %, 4 % and 11%, respectively, for NMHC, NO_x and CO. If New York State goes beyond EPA II and adopts CARB 2 specifications, further reductions achieved in 2012 are estimated to be very small, equaling 2% or less of 1998 levels of NMHC and NO_x emissions, while CO emissions would actually increase by about 2%. When compared to EPA II over the same time frame, LS-EPA II would produce negligible (less than 1%) reductions in each of the above emissions categories.

7243 (ETDE-DE–10) **Computer assisted diagnostic pig system for preventive damage detection in pipelines.** Mineraloelverbundleitung GmbH Schwedt I.G. (Germany). [1992]. 21p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0327102A. Order Number DE95738903. Source: OSTI; NTIS (US Sales Only).

A diagnostic pig was to be developed for detection of cracks and local corrosion on the inner walls of pipelines for petroleum and petroleum products. This is to facilitate early detection of accident-prove pipeline sectors. (orig.)

7244 (GKSS–94/E/14) **Off-gas purification by means of membrane vapor separation systems.** Ohlrogge, K. (GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Chemie); Wind, J.; Behling, R.D. GKSS-Forschungszentrum Geesthacht GmbH (Germnay). 1994. 15p. (CONF-9310360–2: 8.

symposium on separation science and technology for energy applications, Gatlinburg, TN (United States), 24-28 Oct 1993). Order Number DE95738575. Source: OSTI; NTIS (US Sales Only).

The separation and recovery of volatile hydrocarbon vapors from gasoline tank farm off-gases can in Europe be considered to be a state of the art technology. A new application in the treatment of gasoline vapors is the installation of a membrane module in vapor return lines from petrol dispensers to storage tanks at gasoline stations to enhance in the vapor recovery efficiency of this system. For solvent vapor recovery some membrane systems have been installed in the chemical and pharmaceutical industry. The paper deals with design features and operating experience. (orig.)

7245 (NEI-NO–471) **Structural reliability methods for pipeline design and code calibration.** Sotberg, T. (Stiftelsen for Industriell og Teknisk Forskning (SINTEF), Trondheim (Norway)); Leira, B.J. Norsk Petroleumsforening, Oslo (Norway). 1993. 22p. (CONF-9311279–1: Offshore pipelines, Haugesund (Norway), 30 Nov 1993). Order Number DE95737639. Source: OSTI; NTIS.

The objective of this paper is to illustrate the basic principles, the methodology and the potential with respect to application of structural reliability methods for design of offshore pipelines. The method provides a rational tool to include operational experience and new research findings into the design process. This is achieved by introducing appropriate design criteria which are determined from acceptable safety levels for relevant limiting conditions. Focus is on development of reliability based design criteria as a rational way to manage future offshore projects with an optimal balance between project safety and economy. Finally, some examples of application are given. 16 refs., 5 figs., 9 tabs.

7246 (SAND–94-3093C) **Supai salt karst features: Holbrook Basin, Arizona.** Neal, J.T. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9504100–2: 5. multidisciplinary conference on sinkholes and the engineering and environmental impacts of Karst, Gatlinburg, TN (United States), 1-5 Apr 1995). Order Number DE95004772. Source: OSTI; NTIS; GPO Dep.

More than 300 sinkholes, fissures, depressions, and other collapse features occur along a 70 km (45 mi) dissolution front of the Permian Supai Formation, dipping northward into the Holbrook Basin, also called the Supai Salt Basin. The dissolution front is essentially coincident with the so-called Holbrook Anticline showing local dip reversal; rather than being of tectonic origin, this feature is likely a subsidence-induced monoclinal flexure caused by the northward migrating dissolution front. Three major areas are identified with distinctive attributes: (1) The Sinks, 10 km WNW of Snowflake, containing some 200 sinkholes up to 200 m diameter and 50 m depth, and joint controlled fissures and fissure-sinks; (2) Dry Lake Valley and contiguous areas containing large collapse fissures and sinkholes in jointed Coconino sandstone, some of which drained more than 50 acre-feet ($\sim 6 \times 10^4$ m^3) of water overnight; and (3) the McCauley Sinks, a localized group of about 40 sinkholes 15 km SE of Winslow along Chevelon Creek, some showing essentially rectangular jointing in the surficial Coconino Formation. Similar salt karst features also occur between these three major areas. The range of features in Supai salt are distinctive, yet similar to those in other evaporate basins. The wide variety of dissolution/collapse features range in development from incipient surface expression to mature and old age. The features began forming at least by Pliocene time and continue to the present, with recent changes reportedly observed and verified on airphotos with 20 year repetition. The evaporate sequence along interstate transportation routes creates a strategic location for underground LPG storage in leached caverns. The existing 11 cavern field at Adamana is safely located about 25 miles away from the dissolution front, but further expansion initiatives will require thorough engineering evaluation.

7247 (DOE/PC/92104–T7) **Advanced thermally stable jet fuels. Technical progress report, January 1994–March 1994.** Schobert, H.H.; Eser, S.; Song, C.; Hatcher, P.G.; Walsh, P.M.; Coleman, M.M. Pennsylvania State Univ., University Park, PA (United States). Coll. of Earth and Mineral Sciences. May 1994. 82p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92104. Order Number DE95005555. Source: OSTI; NTIS; GPO Dep.

The Penn State program in advanced thermally stable coal-based jet fuels has five broad objectives. First, the development of mechanisms of degradation and solids formation. Second, quantitative measurement of the growth of sub-micrometer and micrometer-sized particles suspended in fuels during thermal stressing will be performed. Third, carbonaceous deposits will be characterized. Fourth, the elucidation of the role of additives in the formation of carbonaceous solids will be investigated. Five, the potential for the production of high yields of cycloalkanes by direct liquefaction of coal will be assessed.

7249 (DOE/EIA–M062/2) **Model documentation natural gas transmission and distribution model (NGTDM) of the national energy modeling system. Volume II: Model developer's report.** USDOE Energy Information Administration, Washington, DC (United States). Office of Integrated Analysis and Forecasting. 3 Jan 1995. 45p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006079. Source: OSTI; NTIS; GPO Dep.

To partially fulfill the requirements for "Model Acceptance" as stipulated in EIA Standard 91-01-01 (effective February 3, 1991), the Office of Integrated Analysis and Forecasting has conducted tests of the Natural Gas Transmission and Distribution Model (NGTDM) for the specific purpose of validating the forecasting model. This volume of the model documentation presents the results of "one-at-a-time" sensitivity tests conducted in support of this validation effort. The test results are presented in the following forms: (1) Tables of important model outputs for the years 2000

and 2010 are presented with respect to change in each input from the reference case; (2) Tables of percent changes from base case results for the years 2000 and 2010 are presented for important model outputs; (3) Tables of conditional sensitivities (percent change in output/percent change in input) for the years 2000 and 2010 are presented for important model outputs; (4) Finally, graphs presenting the percent change from base case results for each year of the forecast period are presented for selected key outputs. To conduct the sensitivity tests, two main assumptions are made in order to test the performance characteristics of the model itself and facilitate the understanding of the effects of the changes in the key input variables to the model on the selected key output variables: (1) responses to the amount demanded do not occur since there are no feedbacks of inputs from other NEMS models in the stand-alone NGTDM run. (2) All the export and import quantities from and to Canada and Mexico, and liquefied natural gas (LNG) imports and exports are held fixed (i.e., there are no changes in imports and exports between the reference case and the sensitivity cases) throughout the forecast period.

7250 (NEI-NO–470) **The outlook for natural gas in Germany.** Bergmann, B. Ruhrgas AG, Essen (Germany). 1993. 40p. (CONF-9305399–1: 7. European gas conference, Oslo (Norway), 12 May 1993). Order Number DE95737638. Source: OSTI; NTIS; INIS.

In a generally stagnant energy market, gas will be the energy with the highest growth rate in Germany, especially because of its steadily rising shares in the residential and commercial sector. In western Germany there is to be accepted that the demand forecasts, which were raised from one conference to the next, have passed their zenith. Great uncertainty exists as regards the future use of gas for power generation. In the absence of any significant expansion of this market sector, which is considered rather improbable in western Germany, it can be stated that anticipated gas demand up to the year 2005 is already covered by existing import contracts and scheduled domestic production. The picture is completely different in eastern Germany, where a doubling of consumption is quite feasible. To achieve the requisite diversification of supplies, substantial additional imports from western sources will have to be contracted. Russia can and should remain eastern Germany's main supplier in the long run, but Russian deliveries must be placed on a reliable, long-term contractual basis. As far as new gas projects are concerned, deliveries from Norway, to a limited extent from the United Kingdom and above all as part of the new Russian export initiative are under discussion. Generally speaking, transit will be an increasingly significant issue, especially for additional supplies from Russia. The efficiency and reliability of gas marketing companies will become far more important in an environment characterised by growing uncertainties. The reliable customer offering a dependable market outlet will be increasingly sought. With energy prices likely to increase only slightly, the management of uncertainties and the safeguarding of economic driving forces will be the main challenge facing our supply projects. 15 figs.

7251 (PNL-SA–25145) **Tax revenue and innovations in natural gas supply: New Mexico.** Ulibarri, C.A.; Marsh, T.L. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9410270–1: Federation of tax administrators revenue estimating and tax research conference, Albuquerque, NM (United States), 23-26 Oct 1994). Order Number DE95004565. Source: OSTI; NTIS; INIS; GPO Dep.

This paper develops an econometric model of natural gas supply at the state-level using New Mexico as a case study. The supply model is estimated using annual time series observations on production levels, delivered prices, proved reserves, existing wells, and extraction costs. The authors validate the model against historical data and then use it to consider the fiscal impacts on state tax revenue from innovations in extraction technologies.

7252 (GRI–93/0091) **Pipeline corridors through wetlands - impact on plant communities: Mill Creek Tributary Crossing, Jefferson County, New York, 1991 survey. Topical report, June 1991–April 1993.** Van Dyke, G.D. (Argonne National Lab., IL (United States)); Shem, L.M.; Zimmerman, R.E. Gas Research Inst., Chicago, IL (United States). Environment and Safety Research Dept.; Argonne National Lab., IL (United States). Dec 1994. 105p. Sponsored by Gas Research Inst., Chicago, IL (United States). DOE Contract W-31109-ENG-38. Contract 5088-252-1770. Order Number DE95004421. Source: OSTI; NTIS; Gas Research Institute, 8600 West Bryn Mawr Ave., Chicago, IL 60631; GPO Dep.

The goal of the Gas Research Institute Wetland Corridors Program is to document impacts of existing pipelines on the wetlands they traverse. To accomplish this goal, 12 existing wetland crossings were surveyed. These sites varied in elapsed time since pipeline construction, wetland type, pipeline installation techniques, and right-of-way (ROW) management practices. This report presents the results of a survey conducted in June 1991 at the Mill Creek tributary crossing, Jefferson County, New York. One pipeline had been installed through the wetland in 1966, and another was scheduled to be installed later in 1991. Data were collected along the existing pipeline ROW and also along the planned ROW for use as baseline data in future studies. Four separate communities were surveyed. A scrub-shrub wetland and a forested wetland were sampled along the existing ROW where the planned pipeline was to be installed. A mixed vegetation community was sampled along the existing ROW, west of where the planned pipeline would joint the ROW. A marsh community was sampled along the route of the planned pipeline. All plant species found on the ROW of the scrub-shrub community were also present in the adjacent natural areas. The vegetation on the ROW of the forested wetland community also consisted mostly of species found in the adjacent natural areas. In the mixed vegetation community, a small drainage channel present on the ROW, possibly resulting from the pipeline construction, provided habitat for a number of obligate species not found in other areas of this community. Differences noted among different areas of this community were also attributed to slight variations in elevation.

7253 (GRI–93/0229) **Pipeline corridors through wetlands – Impacts on plant communities: Little Timber Creek Crossing, Gloucester County, New Jersey. Topical report, August 1991–January 1993.** Shem, L.M. (Argonne National Lab., IL (United States). Center for Environmental Restoration Systems); Zimmerman, R.E.; Alsum, S.K.; Van Dyke, G.D. Gas Research Inst., Chicago, IL (United States); Argonne National Lab., IL (United States). Dec 1994. 55p. Sponsored by Gas Research Inst., Chicago, IL (United States). DOE Contract W-31-109-ENG-38. The goal of the Gas Research Institute Wetland Corridors Program is to document impacts of existing pipelines on the wetlands they traverse. To accomplish this goal, 12 existing wetland crossings were surveyed. These sites varied in elapsed time since pipeline construction, wetland type, pipeline installation techniques, and right-of-way (ROW) management practices. This report presents results of a survey conducted over the period of August 5–7, 1991, at the Little Timber Creek crossing in Gloucester County, New Jersey, where three pipelines, constructed in 1950, 1960, and 1990, cross the creek and associated wetlands. The old side of the ROW, created by the installation of the 1960 pipeline, was designed to contain a raised peat bed over the 1950 pipeline and an open-water ditch over the 1960 pipeline. The new portion of the ROW, created by installation of the 1990 pipeline, has an open-water ditch over the pipeline (resulting from settling of the backfill) and a raised peat bed (resulting from rebound of compacted peat). Both the old and new ROWs contain dense stands of herbs; the vegetation on the old ROW was more similar to that in the adjacent natural area than was vegetation in the new ROW. The ROW increased species and habitat diversity in the wetlands. It may contribute to the spread of purple loosestrife and affect species sensitive to habitat fragmentation.

7254 (GRI–94/0035) **Pipeline corridors through wetlands – Impacts on plant communities: Norris Brook Crossing**

Peabody, Massachusetts. Shem, L.M. (Argonne National Lab., IL (United States)); Van Dyke, G.D.; Zimmerman, R.E. Gas Research Inst., Chicago, IL (United States). Environment and Safety Research Group; Argonne National Lab., IL (United States). Dec 1994. 49p. Sponsored by Gas Research Inst., Chicago, IL (United States). Contract 5088-252-1770. Source: OSTI; Gas Research Institute, 8600 West Bryn Mawr Ave., Chicago, IL 60631 (United States).

The goal of the Gas Research Institute Wetland Corridors Program is to document impacts of existing pipelines on the wetlands they traverse. To accomplish this goal, 12 existing wetland crossings were surveyed. These sites varied in elapsed time since pipeline construction, wetland type, pipeline installation techniques, and right-of-way (ROW) management practices. This report presents the results of a survey conducted August 17–19, 1992, at the Norris Brook crossing in the town of Peabody, Essex County, Massachusetts. The pipeline at this site was installed during September and October 1990. A backhoe was used to install the pipeline. The pipe was assembled on the adjacent upland and slid into the trench, after which the backhoe was used again to fill the trench and cover the pipeline. Within two years after pipeline construction, a dense vegetative community, composed predominantly of native perennial species, had become established on the ROW. Compared with adjacent natural areas undisturbed by pipeline installation, there was an increase in purple loosestrife and cattail within the ROW, while large woody species were excluded from the ROW. As a result of the ROW's presence, habitat diversity, edge-type habitat, and species diversity increased within the site. Crooked-stem aster, Aster prenanthoides (a species on the Massasschusetts list of plants of special concern), occurred in low numbers in the adjacent natural areas and had reinvaded the ROW in low numbers.

7255 (NEI-DK–1810) **Rehabilitation of two gas pipes crossing the river Nemunas in Kaunas, Lithuania. Final report.** Carl Bro A/S, Glostrup (Denmark); Carl Bro Gruppen, Glostrup (Denmark). Dec 1994. 36p. Order Number DE95737583. Source: OSTI; NTIS.

Kauno Dujos, Kaunas Gas, is supplying natural gas to a domestic market including a number of industrial consumers. At the appraisal stage of this project, the natural gas supply system in Kaunas was suffering from insufficient supply capacity. One of the reasons for the problems occurred was that severe corrosion in some of the old steel gas pipe system caused leakages. The objective for the projects is to restore natural gas supply in river crossing no. 3 and then increase the supply for industries and residential housing. Furthermore it is an objective to improve the security of supply in case of necessary disconnections of other main pipes, due to leakages or other events. The present project has been suggested by the Lithuanian authorities in October 1992 for financing under the Danish 'InterMinisterielle Oestlandepulje'-funds under the Lithuanian - Danish governmental negotiations. The two pipes were rehabilitated on 4-5 November 1994. Kaunas Gas has subsequently made the 'tie-in' connections to the existing gas networks, so that gas supply in the two rehabilitated pipes was restored. At present the final documentation is being assembled by the contractor for the client's and the Recipient's final approval. Provisional approvals have, however, been collected from the involved parties. (EG)

7256 (STUDSVIK-M–94-61) **EVOPE - Evaluation of polyethylene pipes for gas distribution. Final report.** Traenkner, T.; Ifwarson, M. Studsvik Material AB, Nykoeping (Sweden). May 1994. 35p. (In Swedish). Project SGC-91-10. Order Number DE95737679. Source: OSTI; NTIS.

Results are presented from an international collaboration project called EVOPE. The aim of the work was to develop a lifetime model for PE-gas pipes. The lifetime of a plastic pipe depends on material, environmental and loading factors. Plastic pipes are exposed to chemical and mechanical degradation. The EVOPE project deals with the mechanical failure mechanisms exclusively since chemical degradation is not a matter of concern during normal service conditions. According to field failure statistics from France and the United States, 84% of all field failures occurred in welds in PE-gas pipes. In general rapid crack propagation is favoured by large pipe diameters, large wall thickness, low temperature and high internal overpressure. Slow crack growth (SCG) is the predominant failure mechanism for brittle long term failures. The SCG-testing with notched specimens was done using dead loaded notched specimens or notched pipe specimens with a constant internal overpressure. Data show that SCG testing with notched specimens reduces the time to brittle failure twenty times compared to hydrostatic pressure testing of un-notched pipes if the specimens are not chemically degraded during testing. Lifetime estimation was possible within a testing time of 30-6000 h (depending on the pipe material) by using SCG-testing at 80 degrees C in air. Of the three resins investigated within EVOPE the Swedish gas pipe material had the longest failure time at 80 degrees C in air. SCG testing is a good method for lifetime estimation and ranking of different PE-materials. 19 refs, 18 figs, 8 tabs

7257 (DOE/MT/94011–1) **Study of the effects of ambient conditions upon the performance of fan powered, infrared, natural gas burners. Quarterly technical progress report, September 1–September 30, 1994.** Bai, T. Clark Atlanta Univ., GA (United States). Dept. of Engineering. Oct 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94MT94011. Order Number DE95005306. Source: OSTI; NTIS; GPO Dep.

The objective of this investigation is to characterize the operation of fan powered infrared(PIR) burner at various barometric pressures (operating altitude) and gas compositions and develop design guidelines for appliances containing PIR burners for satisfactory performance. In this program, the theoretical basis for the behavior of PIR burners will be established through analysis of the combustion, heat and mass transfer, and other related processes which determine the performance of PIR burners. Based on the results of this study, a first order model of the performance of the burner, including radiant output will be developed. The model will be applied to predict the performance of the selected burner and modified through comparison with test results. Concurrently, an experimental setup will be devised and built. This experimental rig will be a modified appliance, capable of measuring the heat and combustion product output, as well as providing a means by which the radiant heat output can be measured. The burner will be selected from an existing commercial appliance, a commercial deep fat fryer, and will be of a scale that will be compatible with the laboratory facilities in the Combustion Laboratory at Clark Atlanta University. Theoretical analysis and formulation of the PIR burner performance model has been started and the development of the test facilities and experimental setup has also been initiated. These are described.

7258 (KE–93005G) **Development of an energy efficient industrial gas combustion system.** Noh, D.S. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Kim, W.B.; Dong, S.K.; Yang, J.B.; Lee, E.K. No corporate text available. Dec 1993. 120p. (In Korean). Order Number DE95744264. Source: OSTI; NTIS (US Sales Only).

A new technical approach is necessary to increase not only energy efficiency, productivity and product quality but also reduction of NOx formation in industrial processes. The aim of the study was to develope an energy efficient industrial gas burner which meet the above requirements. The works were concentrated on the surface combustion using a metallic fiber mat as a burner material. The first year studies included fabrication method and combustion tests for low/high load gas burner. A relatively low NOx, stable combustion and uniform surface radiation characteristics were confirmed. (author). refs., figs., tabs.

Energy. 1992. Filed date 8 Dec 1992. U.S. Patent Application 7-986,828. 26p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006118. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a method and system for converting the chemical energy of methane to electrical energy. Methane is thermally decomposed to hydrogen and carbon in a decomposing unit at a temperature not less than about 1200°K and at a pressure at least slightly above atmospheric pressure. Carbon and substantially pure oxygen and a cesium or potassium seed material is transmitted to a combustor which is maintained at a pressure of at least about 50 atmospheres to combust the carbon and oxygen and provide an ionized plasma having a temperature not less than about 2800°K. The ionized plasma is accelerated to a velocity not less than about 1000 m/sec and transported through an MHD generator having a magnetic field in the range of from about 4 to about 6 Tesla to generate dc power. The ionized plasma is decelerated and passed from the MHD generator in heat exchange relationship with the methane to heat same for decomposition and or reaction, and thereafter any cesium or potassium seed material is recovered and transported to the combustor, and the dc power from the MHD generator is converted to ac power.

7262 (IAEA-R–6773-F) **Application of gas geochemistry in the search for different types of uranium deposits. Final report for the period 15 November 1991 - 15 March 1994.** Chen Guoliang (Beijing Research Inst. of Uranium Geology (BRIUG), Beijing (China)). International Atomic Energy Agency, Vienna (Austria). Oct 1994. 58p. Order Number DE95615481. Source: OSTI; NTIS (US Sales Only); INIS.

This paper presents the study of primary and secondary gas halo and application in the search for different types of uranium deposits in China. Through measuring Rn, CO_2, O_2 and Hg in various deposits of geographical and climatic conditions for the gas geochemical survey. Three comprehensive measuring methods of CO_2, Rn and 0_2 were thought to be optimum for gas geochemical exploration because of its portability, rapidity, low cost, simple operation and limited interference. Our experimental data can be briefly summarized that higher concentration of CO_2, Rn and lower concentration of secondary halo in soil show blinded deposits. Our project have finished the study of thermal emanating gas in soil and rock. The methods were confirmed by known deposits and can be used in uranium exploration or environment investigation. 4 refs, 23 figs, 26 tabs.

7263 (LA–12909-MS) **Thermodynamic modeling of hydrogen fluoride production relevant to actinide residue treatment.** West, M.H.; Axler, K.M. Los Alamos National Lab., NM (United States). Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005914. Source: OSTI; NTIS; GPO Dep.

This report addresses issues specific to generation of hydrogen fluoride via reaction of calcium fluoride with sulfuric acid. This process has been established on a commercial scale and is under consideration for treatment of calcium fluoride residues from uranium processing. Magnesium fluoride slags are also available as a product of uranium processing. The technique of using sulfuric acid for the production of hydrogen fluoride from magnesium fluoride is also under consideration as a residue processing scheme. In the current study, thermodynamic modeling was used to investigate these chemical processing systems. Results presented herein reveal information relevant to selection of processing temperatures and conditions. Details include predicted effects in system composition based on operating temperatures for both the calcium fluoride and the magnesium fluoride systems.

7264 (FRCEA-TH–412) **Application of active neutronic interrogation method to the line analysis in reprocessing plant.** Passard, C. CEA Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France). Dept. d'Etudes des Reacteurs; Grenoble-1 Univ., 38 (France). 12 Feb 1993. 308p. (In French). Order Number DE95612016. Source: OSTI; NTIS (US Sales Only); INIS.

In a reprocessing plant of irradiated spent fuels, the knowledge in real time (line analysis) of uranium and plutonium quantities present in solutions is an extremely important parameter to control the proceeding and for the apparatus safety. The active neutronic analysis give a nondestructive non intrusive and quick measure to know the concentrations. This method consists in inducing fissions in nuclides with a neutron source and then to detect the particles which come from.

7265 (IAEA-TECDOC–765) **Problems concerning the accumulation of separated plutonium. Report of an advisory group meeting held in Vienna, 26-29 April 1993.** International Atomic Energy Agency, Vienna (Austria). Sep 1994. 69p. (CONF-9304279–: Advisory group meeting on problems concerning the accumulation of separated plutonium, Vienna (Austria), 26-29 Apr 1993). Order Number DE95612017. Source: OSTI; NTIS (US Sales Only); INIS.

Due to the delays worldwide in the development and starting up of fast breeder reactors (which require large amounts of plutonium at startup) and the ongoing reprocessing of spent fuel (which produces separated plutonium), significant quantities of separated plutonium are being created. An Advisory Group meeting was held in April 1993 to consider this situation. The meeting had two primary objectives: to determine the magnitude of the plutonium accumulations and to identify potential problems related to this accumulation of separated plutonium. In this document IAEA estimates of present and projected inventories of separated plutonium are presented and discussed. Document also contains presentations from representatives of Member States on national

programmes for production and utilization of separated plutonium. Refs, figs and tabs.

The paper describes the commercial facilities required for plutonium recycling. It presents the status of the French plutonium fuel cycle facilities in operation or under construction, including the quantities of materials treated to date and the current and anticipated capacity for the coming years. The French policy on plutonium management, including loading uranium oxide and uranium-plutonium oxide fuels in light water reactors over the coming years, is also described. Finally, French research and development relating to plutonium management, particularly with respect to advanced reactors, is presented. (author). 2 figs, 4 tabs.

India's nuclear power programme is entirely self-reliant, including plutonium recycle. Although the first power plants were BWRs, the primary reactor type is now the PHWR utilizing natural uranium. The long range programme anticipates the use of FBRs. Most of India's plutonium is not separated and remains in spent fuel. Plutonium is utilized shortly after separation; no long term plutonium storage is planned. (author). 3 tabs.

Source: OSTI; NTIS (US Sales Only); INIS.

Japan's nuclear program, of necessity, includes fuel reprocessing and recycling of uranium and plutonium for several reasons; Japan lacks natural resources and recycling utilizes resources more efficiently, the environmental impact is reduced and waste disposal problems are reduced. Japan is strongly committed to nuclear non-proliferation and will not possess plutonium (a militarily sensitive material) in amounts greater than required for its fuel cycle program. Japan has submitted to full scope safeguards and supports efforts to improve safeguards effectiveness. Japan's plutonium recycle program will focus first on FBRs then on LWRs and ATR. To gain a greater degree of acceptance both domestically and abroad Japan will endeavour to provide greater openness and transparence throughout its nuclear program. Japan's plutonium recycling programme will consume 80 to 90 tonnes of fissile plutonium by 2010. (author).

Source: OSTI; NTIS (US Sales Only); INIS.

Russia now has 20 GW of installed nuclear capacity (vs 36.4 GW in the former USSR). Stagnation in the Russian nuclear industry has delayed many programmes. Russia believes a closed fuel cycle to be the most economical - but continued low uranium prices and buildup of separated plutonium raise questions. Projected separated plutonium inventories vary greatly, depending on assumed reprocessing rates and BN-800 plutonium utilization rates. The start-up of RT-2 in 2002-2005 will increase plutonium annual separation rate by 3.2 tonnes. Nearly all of the nuclear scientists and engineers of the former USSR now resides in Russia. Utilization of plutonium in thermal reactors could be speeded up by international technical co-operation. (author). 4 tabs.

7272 (IAEA-TECDOC–765, pp. 53-57) **Utilization in BN-800 fast reactors of isolated plutonium being accumulated in the Russian Federation.** Kagramanyan, V.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst.). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9304279–: Advisory group meeting on problems concerning the accumulation of separated plutonium, Vienna (Austria), 26-29 Apr 1993). In *Problems concerning the accumulation of separated plutonium. Report of an advisory group meeting held in Vienna, 26-29 April 1993.* 69p. Order Number DE95612017. Source: OSTI; NTIS (US Sales Only); INIS.

The Russian Federation has presently an inventory of about 26 tonnes of civil separated plutonium, with an annual production rate of 2.5 tonnes. When RT-2 reprocessing plant starts in 2005, the annual production will increase. In addition 50-100 tonnes of plutonium are expected to be released from nuclear weapons. The first BN-800 reactor is supposed to be finished by 2000. Three more BN-800 units are expected to be introduced by 2005. These four units will consume all plutonium inventories. Use in fast reactors is preferred since Thermal reactor utilization does not efficiently utilize the energy content - particularly of the weapon material. (author). 3 refs, 2 figs.

7273 (IAEA-TECDOC–765, pp. 59-61) **Problems concerning the accumulation of isolated plutonium - The Swiss situation.** Bay, H. (Nordostschweizerische Kraftwerke AG, Baden (Switzerland)). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9304279–: Advisory group meeting on problems concerning the accumulation of separated plutonium,

Vienna (Austria), 26-29 Apr 1993). In *Problems concerning the accumulation of separated plutonium. Report of an advisory group meeting held in Vienna, 26-29 April 1993.* 69p. Order Number DE95612017. Source: OSTI; NTIS (US Sales Only); INIS.

At present Switzerland has only kilogram quantities of separated plutonium domestically. Contracts for reprocessing spent fuel with COGEMA and BNFL will result in 6.2 tonnes of fissile plutonium prior to 2004. All this plutonium will be consumed by Swiss utilities as MOX. The inventory of separated Swiss plutonium will never exceed 0.6 tonnes. The greatest uncertainty in the Swiss plutonium utilization programme results from delays in approval from the US DOE for proceeding with spent nuclear fuel subject to prior consent rights. (author). 2 figs.

7274 (IAEA-TECDOC–765, pp. 63-65) **Plutonium arisings and utilization in the United Kingdom.** Dodds, R. (British Nuclear Fuels plc, Risley (United Kingdom). THORP Div.). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9304279–: Advisory group meeting on problems concerning the accumulation of separated plutonium, Vienna (Austria), 26-29 Apr 1993). Source: OSTI; NTIS (US Sales Only); INIS.

The UK has presently 11.1 GW installed nuclear generating capacity with an additional 1.2 GW under construction. Plutonium is separated domestically at Sellafield and will be separated for both domestic and foreign customers in the THORP facility which is now complete but not yet in operation. Current stocks of separated plutonium at Sellafield are 35 tonnes. Total plutonium arisings from AGR fuel will be 58 t; 15 t additional plutonium will come from LWR fuel reprocessed at THORP. Plutonium will be utilized in LWRs since fast reactor deployment has been delayed till after 2030, and there is no incentive to use plutonium in AGRs which require only low enrichment fuels. (author).

7275 (IAEA-TECDOC–766, pp. 45-50) **Operational safety in plutonium processing workshops at the La Hague site.** Mathieu, P. (Compagnie Generale des Matieres Nucleaires (COGEMA), Beaumont Hague (France)). International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310405–: Technical committee meeting on safe handling, transport and storage of plutonium, Vienna (Austria), 18-21 Oct 1993). In *Safe handling, transport and storage of plutonium. Proceedings of a technical committee meeting held in Vienna, 18-21 October 1993.* 120p. Order Number DE95614900. Source: OSTI; NTIS (US Sales Only); INIS.

To keep under control the nuclear and non-nuclear hazards of plutonium treatment and handling, and to implement the corporate policy to reduce the doses to personnel in compliance with ALARA, it has been necessary to document operating rules. They take into account the following items: Operation of the facility: The facility is operated in compliance with documents containing both operating instructions and definition of the limits of the normal operation area (including the evolution of the operating parameters). A method to manage the non-conformities with those requirements is always implemented when a barrier of the authorized area has been passed. Each member of the operating team is trained and the documents are explained. Maintenance and periodic survey: The good operation of the facility requires to implement maintenance and survey plans, complemented with the experience got back during operation. The periodic cleaning of the enclosures containing plutonium is an example of an item of those plans. Plant modification and refurbishment: From design to decommissioning, the facility has to be improved and enhanced. All the plans for that purpose are checked before implementation in order to verify that the safety of the workshop is by no means weakened, and that no unexpected hazard is to take place during the completion of the work. From the beginning of the project a dosimetric target is assigned. After completion of the work, the target is compared with the cumulated dose of the project, in order to find out the appropriate conclusions. The implementation of that method in our plutonium treatment facilities has provided quite good results concerning both doses to personnel and operation safety. (author).

7276 (IAEA-TECDOC–766, pp. 69-76) **Criticality accidents and simplified estimation of total fission number.** Nomura, Y. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Dept. of Fuel Cycle Safety Research); Okuno, H. International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310405–: Technical committee meeting on safe handling, transport and storage of plutonium, Vienna (Austria), 18-21 Oct 1993). In *Safe handling, transport and storage of plutonium. Proceedings of a technical committee meeting held in Vienna, 18-21 October 1993.* 120p. Order Number DE95614900. Source: OSTI; NTIS (US Sales Only); INIS.

For a safety assessment of nuclear fuel facilities such as for reprocessing, handling, storage and transportation, one needs to know the scale of criticality accidents, assumed to occur in uranium or plutonium fissile systems. In this paper, noticeable characteristics of the criticality accidents are discussed, and then a simplified evaluation model for predicting the scale, i.e., the number of total fissions in the accidents is derived theoretically by using one point adiabatic reactivity balance model. This model is subsequently validated through the comparison with the transient experiments and the actual accident data reported so far in American and European countries. Some conventional simplified evaluation models are quoted to emphasize the convenience of the proposed model having less constriction in application. (author). 9 refs, 2 figs.

7277 (IAEA-TECDOC–766, pp. 87-94) **Plutonium production and storage at BNFL Sellafield, United Kingdom.** Leigh, B. (British Nuclear Fuels plc, Sellafield (United Kingdom)). International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310405–: Technical committee meeting on safe handling, transport and storage of plutonium, Vienna (Austria), 18-21 Oct 1993). In *Safe handling, transport and storage of plutonium. Proceedings of a technical committee meeting held in Vienna, 18-21 October 1993.* 120p. Order Number DE95614900. Source: OSTI; NTIS (US Sales Only); INIS.

Plutonium has been safely produced and stored at BNFL Sellafield for over 40 years. Although the basic chemical processes have not significantly changed throughout that time, the designs of the plants and stores have continuously improved to meet increased capacity requirements and more demanding safety standards for plant operators and the public. Features of the plants that have evolved included those addressing external radiation, containment, criticality, liquid effluent and ventilation and aerial effluent. Examples of these changes will be described and their current status discussed, illustrating how the modern currently operating plants and stores incorporate multiple diverse and redundant features to ensure safety under normal and fault conditions. As well as some reference to design standards and codes of practice, comments will be made on the procedures by which the safety of the operating plant may be demonstrated to both BNFL and the regulatory authorities. These include continuous review and audit together with hazard and probabilistic risk assessments. In addition to considering the currently operating plants, some reference will also be made to future plants, primarily the THORP facility, to illustrate the continuing evolution of the plants. The paper will thus present and overview, supported by specific examples, of the development and safe operation of a large scale plutonium finishing plant and storage facility. (author).

7278 **Process to remove rare earth from IFR electrolyte.** Ackerman, J.P.; Johnson, T.R. To Dept. of Energy. 1992. Filed date 31 Dec 1992. U.S. Patent Application 7-999,339. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31-109-ENG-38. Order Number DE95006112. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The invention is a process for the removal of rare earths from molten chloride electrolyte salts used in the reprocessing of integrated fast reactor fuel (IFR). The process can be used either continuously during normal operation of the electrorefiner or as a batch process. The process consists of first separating the actinide values from the salt before purification by removal of the rare earths. After replacement of the actinides removed in the first step, the now-purified salt electrolyte has the same uranium and plutonium concentration and ratio as when the salt was removed from the electrorefiner.

This paper introduces the principles and rules applied currently in France for design and construction of the part of reprocessing plant where plutonium is handled. The following fields are reviewed: containment consists in successive barriers between radioactive materials, workers and environment. Their efficiency is continuously monitored; ventilation of process equipment and surrounding cells and rooms: contaminated gas release is prevented by keeping a negative pressure cascade and by appropriate gas treatment; these treatments are defined according to family classification corresponding to level of contamination risk; radiation control: plant is zoned in view of protection against radiation. Monitoring system enables to evaluate the exposure level of personnel and to control their environment; criticality: safety analysis has to demonstrate that criticality cannot result of a single failure. In most of the case, criticality safety is ensured by geometry; fire risks are minimized by prevention (choice of equipment and operating conditions), by early detection system and automatic extinction system and by protection such as specific room classification and implementation of fire breaks; specific analysis and subsequent measures are taken to prevent explosion risks linked for instance to use of solvent, or presence of hydrogen due to radiolysis; cooling of high concentrated Pu solution and equipment containing PuO_2 is provided; solid and liquid wastes: their production is minimized thanks to an appropriate wastes management and to efficient decontamination processes. The application of these rules to the new Pu facilities of La Hague allows to ensure safety of operation, efficiency of the process, significant reduction of dose rate to personnel and decrease of volume of wastes to be stored and of effluents discharged to the environment. (author). 1 tab.

7280 (IAEA-TECDOC–766, pp. 51-68) **Safety of plutonium shipments in and from France.** Renard, C. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire); Mathieu, F.; Desnoyers, B.; Malesys, P. International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310405–: Technical committee meeting on safe handling, transport and storage of plutonium, Vienna (Austria), 18-21 Oct 1993). In *Safe handling, transport and storage of plutonium. Proceedings of a technical committee meeting held in Vienna, 18-21 October 1993.* 120p. Order Number DE95614900. Source: OSTI; NTIS (US Sales Only); INIS.

Plutonium extracted from irradiated fuel at reprocessing plants is used in the manufacture of fresh fuel for light water reactors (MOX) or fast breeder reactors. Consequently various forms of plutonium have to be transported in France and between France and other countries. In 1945 France adopted a regulation for the safe transport of dangerous goods (RTMD) which was revised most recently in 1992. This regulation complies with international rules for the land transport of dangerous goods in Europe which take into account the recommendations of the IAEA for the safe transport of radioactive materials. For other shipment modes (by air and sea), France adopts directly applicable international regulations which also take into account the IAEA regulations. To meet these regulations safety is usually provided by the package, independent of the transport mode employed. Even for transport of a few grams, packages used for plutonium dioxide must be of the most stringent type design TYPE B/F. For this type of package, IAEA defines requirements corresponding with normal and accidental situations. Different packages have been developed and are used in France for the transport of material containing plutonium. In France, the competent authority for the transport of dangerous goods is the Ministry of Transport which relies on the IPSN. However, other ministries do also provide prominent roles, particularly for the case of accidents on public thoroughfares: Ministry of Interior, of Health, of Industry. In the case of abnormal situations arising during the transport of radioactive materials, special procedures can be applied: National intervention plans (PSS/TMR, NUCMAR); the transporters own emergency plans (PLUT). Each of these items are discussed in the paper. 9 refs, 8 figs.

7281 (IAEA-TECDOC–766, pp. 109-117) **Plutonium transport: The UK experience - 35 years on.** Carr, M. (British Nuclear Fuels plc, Risley (United Kingdom). Engineering and Technical Services). International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310405–: Technical committee meeting on safe handling, transport and storage of plutonium, Vienna (Austria), 18-21 Oct 1993). In *Safe handling, transport and storage of plutonium. Proceedings of a technical committee meeting held in Vienna, 18-21 October 1993.* 120p. Order Number DE95614900. Source: OSTI; NTIS (US Sales Only); INIS.

Plutonium transport dates back to the beginning of the nuclear industry in the United Kingdom. Advances in regulatory processes and the development of nuclear plants has led to an internationalisation of nuclear transport. The United Kingdom, as an island, has had to develop transport packaging and systems to meet this challenge. The safety of the transport is vested in the packaging but the mode of transport cannot be ignored, safety and security go hand-in-hand where international consignments are concerned. Fuel assemblies have posed further considerations of fuel integrity and vibration control to be taken into account and the applicability of current modes of transport and assets have to be examined against these requirements. The regulatory process continues and imposes yet further constraints on these transports which have to be considered and solutions found. Despite these problems, BNFL continues to be committed to the continuation of such transports finding safe, secure and cost effective solutions. (author). 6 refs.

7282 (ORNL/M–3077) **Transportation and packaging resource guide.** Arendt, J.W.; Gove, R.M.; Welch, M.J. Oak Ridge National Lab., TN (United States). Dec 1994. 133p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004881. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this resource guide is to provide a convenient reference document of information that may be useful to the U.S. Department of Energy (DOE) and DOE contractor personnel involved in packaging and transportation activities. An attempt has been made to present the terminology of DOE community usage as it currently exists. DOE's mission is changing with emphasis on environmental cleanup. The terminology or nomenclature that has resulted from this expanded mission is included for the packaging and transportation user for reference purposes. Older terms still in use during the transition have been maintained. The Packaging and Transportation Resource Guide consists of four sections: Sect. 1, Introduction; Sect. 2, Abbreviations and Acronyms; Sect. 3, Definitions; and Sect. 4, References for packaging and transportation of hazardous materials and related activities, and Appendices A and B. Information has been collected from DOE Orders and DOE documents; U.S Department of Transportation (DOT), U.S. Environmental Protection Agency (EPA), and U.S. Nuclear Regulatory Commission (NRC) regulations; and International Atomic Energy Agency (IAEA) standards and other international documents. The definitions included in this guide may not always be a regulatory definition but are the more common DOE usage. In addition, the definitions vary among regulatory agencies. It is, therefore, suggested that if a definition is to be used in a regulatory or a legal compliance issue, the definition should be verified with the appropriate regulation. To assist in locating definitions in the regulations, a listing of all definition sections in the regulations are included in Appendix B. In many instances, the appropriate regulatory reference is indicated in the right-hand margin.

7283 (WHC-SD-FF-DRR–00018) **Design review report FFTF interim storage cask.** Scott, P.L. Westinghouse Hanford Co., Richland, WA (United States). 3 Jan 1995. 180p. Sponsored

by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005286. Source: OSTI; NTIS; INIS; GPO Dep.

Final Design Review Report for the FFTF Interim Storage Cask. The Interim Storage Cask (ISC) will be used for long term above ground dry storage of FFTF irradiated fuel in Core Component Containers (CCC)s. The CCC has been designed and will house assemblies that have been sodium washed in the IEM Cell. The Solid Waste Cask (SWC) will transfer a full CCC from the IEM Cell to the RSB Cask Loading Station where the ISC will be located to receive it. Once the loaded ISC has been sealed at the RSB Cask Loading Station, it will be transferred by facility crane to the DSWC Transporter. After the ISC has been transferred to the Interim Storage Area (ISA), which is yet to be designed, a mobile crane will be used to place the ISC in its final storage location.

7284 (WHC-SD-SNF-EDL–001) **Interim essential and support drawing list for K Basins.** Langevin, M.J. Westinghouse Hanford Co., Richland, WA (United States). 16 Dec 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005643. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents a list of essential and support drawings that have been identified as required to achieve the mission objectives of K Basin and are an integral part of the in-progress K Basins system baselining effort. The drawings listed in the appendix are those drawings required to safely operate K Basins. These drawings will be authenticated through the field verification and design reconstitution programs to ensure that these identified drawings are consistent with design requirements.

7285 (WSRC-TR–94-0366) **Equivalence relations for the 9972-9975 SARP.** Niemer, K.A.; Frost, R.L. Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95004800. Source: OSTI; NTIS; INIS; GPO Dep.

Equivalence relations required to determine mass limits for mixtures of nuclides for the Safety Analysis Report for Packaging (SARP) of the Savannah River Site 9972, 9973, 9974, and 9975 shipping casks were calculated. The systems analyzed included aqueous spheres, homogeneous metal spheres, and metal ball-and-shell configurations, all surrounded by an effectively infinite stainless steel or water reflector. Comparison of the equivalence calculations with the rule-of-fractions showed conservative agreement for aqueous solutions, both conservative and non-conservative agreement for the metal homogeneous sphere systems, and non-conservative agreement for the majority of metal ball-and-shell systems. Equivalence factors for the aqueous solutions and homogeneous metal spheres were calculated. The equivalence factors for the non-conservative metal homogeneous sphere systems were adjusted so that they were conservative. No equivalence factors were calculated for the ball-and-shell systems since the -SARP assumes that only homogeneous or uniformly distributed material will be shipped in the 9972-9975 shipping casks, and an unnecessarily conservative critical mass may result if the ball-and-shell configurations are included.

7286 (WSRC-TR–94-0438) **Department of Energy Plutonium ES&H Vulnerability Assessment Savannah River Site interim compensatory measures.** Bickford, W.E. Westinghouse Savannah River Co., Aiken, SC (United States). 15 Sep 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95002694. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Site (SRS) has recently completed a self-assessment of potential vulnerabilities associated with plutonium and other transuranic materials stored at the site. An independent Working Group Assessment Team (WGAT) appointed by DOE/ES&H also performed an independent assessment, and reviewed and validated the site self-assessment. The purpose of this report is to provide a status of interim compensatory measures at SRS to address hazards in advance of any corrective actions. ES&H has requested this status for all vulnerabilities ranked medium or higher with respect to potential consequences to workers, environment, and the public.

7288 (AEA-D and R–0891(ed.2)) **Modelling gas generation in radioactive waste repositories.** Agg, P.J. AEA Decommissioning and Radwaste, Harwell (United Kingdom). Feb 1993. 22p. Order Number DE95613248. Source: OSTI; NTIS (US Sales Only); INIS.

In a repository containing low- and intermediate-level waste, gas generation will occur principally by the coupled processes of metal corrosion and microbial degradation of cellulosic waste. This Paper describes a mathematical model design to address gas generation by these mechanisms. The metal corrosion model incorporates a three-stage process encompassing both aerobic and anaerobic corrosion regimes; the microbial degradation model simulates the activities of eight different microbial populations, which are maintained as functions both of pH and of the concentrations of particular chemical species. Gas concentrations have been measured over a period of three years in large-scale drum experiments designed to simulate repository conditions. Model predictions are confirmed against the experimental measurements, and a prediction is then made of gas concentrations and generation rates over an assessment period of one million years in a radioactive waste repository. (author).

7289 (ANL–94/33) **Basic TRUEX process for Rocky Flats Plant.** Leonard, R.A.; Chamberlain, D.B.; Dow, J.A.; Farley, S.E.; Nunez, L.; Regalbuto, M.C.; Vandegrift, G.F. Argonne National Lab., IL (United States). Aug 1994. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95005880. Source: OSTI; NTIS; INIS; GPO Dep.

The Generic TRUEX Model was used to develop a TRUEX process flowsheet for recovering the transuranics (Pu, Am) from a nitrate waste stream at Rocky Flats Plant. The process was designed so that it is relatively insensitive to changes in process feed concentrations and flow rates. Related issues are considered, including solvent losses, feed analysis requirements, safety, and interaction with an evaporator system for nitric acid recycle.

7290 (BNL–61127) **Subsurface barrier verification technologies, informal report.** Heiser, J.H. Brookhaven National Lab., Upton, NY (United States). Jun 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95004950. Source: OSTI; NTIS; INIS; GPO Dep.

One of the more promising remediation options available to the DOE waste management community is subsurface barriers. Some of the uses of subsurface barriers include surrounding and/or containing buried waste, as secondary confinement of underground storage tanks, to direct or contain subsurface contaminant plumes and to restrict remediation methods, such as vacuum extraction, to a limited area. To be most effective the barriers should be continuous and depending on use, have few or no breaches. A breach may be formed through numerous pathways including: discontinuous grout application, from joints between panels and from cracking due to grout curing or wet-dry cycling. The ability to verify barrier integrity is valuable to the DOE, EPA, and commercial sector and will be required to gain full public acceptance of subsurface barriers as either primary or secondary confinement at waste sites.

It is recognized that no suitable method exists for the verification of an emplaced barrier's integrity. The large size and deep placement of subsurface barriers makes detection of leaks challenging. This becomes magnified if the permissible leakage from the site is low. Detection of small cracks (fractions of an inch) at depths of 100 feet or more has not been possible using existing surface geophysical techniques. Compounding the problem of locating flaws in a barrier is the fact that no placement technology can guarantee the completeness or integrity of the emplaced barrier. This report summarizes several commonly used or promising technologies that have been or may be applied to in-situ barrier continuity verification.

7291 (BNL-A–3259) **ALARA notes, Number 8.** Khan, T.A.; Baum, J.W.; Beckman, M.C. (eds.). Brookhaven National Lab., Upton, NY (United States). Oct 1993. 27p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95005931. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains information dealing with the lessons learned from the experience of nuclear plants. In this issue the authors tried to avoid the 'tyranny' of numbers and concentrated on the main lessons learned. Topics include: filtration devices for air pollution abatement, crack repair and inspection, and remote handling equipment.

7292 (CNIC–00782) **Study on treatment of wastewater containing plutonium in CIAE (China Institute of Atomic Energy).** Zeng Jishu (Academia Sinica, Beijing, BJ (China). Inst. of Atomic Energy); Su Xiguang; Xia Deying; Zhou Hongping. China Nuclear Information Centre, Beijing, BJ (China). Sep 1993. 10p. (In Chinese). (IAE–0123.). Order Number DE95613235. Source: OSTI; NTIS (US Sales Only); INIS.

The wastewater containing plutonium in China Institute of Atomic Energy (CIAE) is a kind of specific decontamination liquid waste containing $^{239,240}Pu$, ^{241}Am etc, its alpha-radioactivity is about 1×10^5 Bq/L. It is not suitable for treatment in Low-Level Radwaste Treatment Plant (LLRTP) due to its high alpha-radioactivity level and has been stored for 17 years. In view of safe management of radioactive waste, a conceptual treatment process for this liquid waste is presented. and the methods in the process are demonstrated. The results obtained show that any method of chemical coagulation precipitation, adsorption by P301 absorbent and ion exchange by macro porous cation exchange resin (D001-CC) can drop the alpha-radioactivity level below 3.7×10^3 Bq/L which could meet the acceptable requirements of LLRTP.

7293 (CONF-9401111–1-Rev.1) **Non-Salado flow and transport position paper. Revision 1.** Axness, C. (and others); Beauheim, R.; Behl, Y. Sandia National Labs., Albuquerque, NM (United States). 15 Dec 1994. 134p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. From System prioritization method (SPM) workshop; Carlsbad, NM (United States); 9 Jan 1994. Order Number DE95004830. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is preparing to request the US Environmental Protection Agency (EPA) to certify compliance of the Waste Isolation Pilot Plant (WIPP) with long-term requirements of the environmental Radiation Protection Standards for Management and Standards for Management and Disposal of Spent Nuclear Fuel, High-Level and Transuranic Waste (40 CFR Part 191). The DOE must also demonstrate compliance with the long-term requirements of the Land Disposal Restrictions of the Resource Conservation and Recovery Act (RCRA) (40 CFR Part 268.6). Sandia National Laboratories (SNL) has ben conducting iterative performance assessments (PAs) for the the WIPP to provide guidance to the project on the technical activities required to determine long-term performance of the WIPP disposal system. The most recent PA was conducted in 1992. The objectives of this paper are to: (1) Identify and describe the relationship between non-Salado hydrology and the array of scenarios that might be relevant to the long-term performance of the repository. (2) Identify and describe the array of conceptual and mechanistic models that are required to evaluate the scenarios for the purpose of compliance. (3) Identify and describe the data/information that are required to support the conceptual and mechanistic models.

7294 (CONF-941088–1) **Evolution of patterns of regional groundwater flow in southeastern New Mexico: Response to post-Pleistocene changes in climate.** Corbet, T.F. Sandia National Labs., Albuquerque, NM (United States). [1994]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. From Annual meeting of the Geological Society of America; Seattle, WA (United States); 24-27 Oct 1994. Order Number DE95005963. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) is a potential repository for transuranic wastes generated by defense programs of the US Department of Energy. The repository site is located 42 km east of the city of Carlsbad, New Mexico in a thick, Permian-age deposit of bedded salt. One consideration in evaluating the performance of the repository is that a future society might inadvertently penetrate the repository with one or more drill holes. Given certain circumstances, these holes could provide a pathway for contaminated brine to move upward into relatively permeable strata located above the bedded salt. There is concern that flowing groundwater could then transport radionuclides laterally to the sub-surface portion of the accessible environment, currently defined by the disposal regulations as the region more than 5 kilometers from the radioactive waste. The simulations presented here are part of a numerical modeling study of the possible impact that a change in climate over the next 10,000 years could have on the pattern of groundwater flow and, consequently, on the migration of radionuclides in strata overlying the repository.

7296 (CONF-950304–5) **Atmospheric corrosion monitoring at the US Department of Energy's Oak Ridge K-25 Site.** Rao, M. Oak Ridge K-25 Site, TN (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OT21400. From Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show; Orlando, FL (United States); 26-31 Mar 1995. Order Number DE95003749. Source: OSTI; NTIS; INIS; GPO Dep.

Depleted uranium hexafluoride (UF_6) at the US Department of Energy's K-25 Site at Oak Ridge, TN has been stored in large steel cylinders which have undergone significant atmospheric corrosion damage over the last 35 years. A detailed experimental program to characterize and monitor the corrosion damage was initiated in 1992. Large amounts of corrosion scale and deep pits are found to cover cylinder surfaces. Ultrasonic wall thickness measurements have shown uniform corrosion losses up to 20 mils (0.5 mm) and pits up to 100 mils (2.5 mm) deep. Electrical resistance corrosion probes, time-of-wetness sensors and thermocouples have been attached to cylinder bodies. Atmospheric conditions are monitored using rain gauges, relative humidity sensors and thermocouples. Long-term (16 years) data are being obtained from mild steel corrosion coupons on test racks as well as attached directly to cylinder surfaces. Corrosion rates have been found to intimately related to the times-of-wetness, both tending to be higher on cylinder tops due to apparent sheltering effects. Data from the various tests are compared, discrepancies are discussed and a pattern of cylinder corrosion as a function of cylinder position and location is described.

7297 (DOE/OR–01-1258-D2) **Design assessment for Melton Valley liquid low-level waste collection and transfer system upgrade project at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Oct 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/M–3805). Order Number DE95004742. Source: OSTI; NTIS; INIS; GPO Dep.

This project is designed for collecting liquid low level waste (LLLW) from generating points inside the Radioisotope Engineering and Development Center (Buildings 7920 and 7930) facility and

transferring this waste to the Collection Tank (F-1800) in the new Monitoring and Control Station (MCS) facility. The LLLW is transferred to the MCS in a new, underground, jacketed, stainless steel piping system. The LLLW will then be transferred from Tank F-1800 through a new, underground, jacketed, stainless steel piping system that connects the existing Bethel Valley LLLW Collection System and the Evaporator Facility Service Tanks. The interface for the two systems will be at the existing Interconnecting Pipe Line (ICPL) Valve Box adjacent to the Nonradiological Wastewater Treatment Plant. The project scope consists of the following systems: (1) Building 7920 LLLW Collection System; (2) Building 7930 LLLW Collection System; (3) LLLW Underground Transfer System to MCS; (4) MCS Building (including all equipment contained therein); (5) LLLW Underground Transfer System to ICPL Valve Box; and (6) Leak detection system for jacketed piping systems (3) and (5).

7298 (DOE/OR–01-1292-D2) **FY 1995 Remedial Investigation Work Plan for Waste Area Grouping 2 at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Watkins, D.R.; Herbes, S.E. (eds.). Oak Ridge National Lab., TN (United States). Dec 1994. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–251-D2). Order Number DE95005882. Source: OSTI; NTIS; INIS; GPO Dep.

ESD Publication 4302.

The purpose of this project is to provide key information needed by decision makers to expedite the process of environmental restoration and to provide the data base required by the Remedial Investigation/Feasibility Study (RI/FS) for Waste Area Grouping (WAG) 2 at Oak Ridge National Laboratory (ORNL). WAG 2 is the major drainage system downgradient of other WAGs that contain significant sources of contamination at ORNL. Field activities to support the remedial investigation for the RI portion include characterization of the nature and extent of contamination in WAG 2 [consisting of White Oak Creek (WOC) and associated tributaries and floodplain, White Oak Lake (WOL), and White Oak Creek Embayment (WOCE)], specifically to support risk-based remediation decisions. The project consists of three phases: Phase 1, initial scoping characterization to determine the need for early action; Phase 2, interim activities during remediation of upslope WAGs to evaluate potential changes in the contamination status of WAG 2 that would necessitate revaluation of the need for early action; and Phase 3, completion of the RI process following remediation of upslope WAGs. Overall RI objectives, consistent with ORNL Environmental Restoration (ER) Program strategic objectives to reduce risks and comply with environmental regulations, are discussed in the WAG 2 Remedial Investigation Plan.

7299 (DOE/OR–01-1311-D2) **Design/installation and structural integrity assessment under the Federal Facility Agreement for Bethel Valley low-level waste collection and transfer system upgrade for Building 2026 (High Radiation Level Analytical Laboratory) and Building 2099 (Monitoring and Control Station) at Oak Ridge National Laboratory.** Oak Ridge National Lab., TN (United States); Gilbert/Commonwealth, Inc., Oak Ridge, TN (United States). Nov 1994. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–270-D2). Order Number DE95004740. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents a Design/Installation and Structural Integrity Assessment for a replacement tank system for portions of the Bethel Valley Low-Level Waste (LLW) System, located at the Oak Ridge Reservation, Oak Ridge, Tennessee. This issue of the assessment covers the design aspects of the replacement tank system, and certifies that the design has sufficient structural integrity and is acceptable for the storing or treating of hazardous and/or radioactive substances. This document will be reissued at a future date and will then include the assessment of the installation of the replacement tank system. The present issue identifies specific activities that must be completed during the fabrication, installation, and testing of the replacement tank system in order to provide assurance that the final installation complies with governing requirements.

7300 (DOE/OR–1047-D2) **Design demonstrations for category B tank systems at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States); Foster-Wheeler Environmental Corp., Oak Ridge, TN (United States). Nov 1994. 243p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/M–3964). Order Number DE95004741. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents design demonstrations conducted of liquid low-level waste (LLLW) storage tank systems located at the Oak Ridge National Laboratory (ORNL). Demonstration of the design of these tank systems has been stipulated by the Federal Facility Agreement (FFA) between the US Environmental Protection Agency (EPA)-Region IV; the Tennessee Department of Environment and Conservation (TDEC); and the DOE. The FFA establishes four categories of tanks. These are: Category A – New or replacement tank systems with secondary containment; Category B – Existing tank systems with secondary containment; Category C – Existing tank systems without secondary containment; Category D – Existing tank systems without secondary containment that are removed from service. This document provides a design demonstration of the secondary containment and ancillary equipment of 11 tank systems listed in the FFA as Category B. The design demonstration for each tank is presented.

7301 (DOE/OR/22160–T14) **Demonstration testing and evaluation of in situ soil heating. Treatability study work plan (Revision 2).** Sresty, G.C. IIT Research Inst., Chicago, IL (United States). 30 Dec 1994. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-93OR22160. Order Number DE95004858. Source: OSTI; NTIS; INIS; GPO Dep.

A Treatability Study planned for the demonstration of the in situ electromagnetic (EM) heating process to remove organic solvents is described in this Work Plan. The treatability study will be conducted by heating subsurface vadose-zone soils in an organic plume adjacent to the Classified Burial Ground K-1070-D located at K-25 Site, Oak Ridge. The test is scheduled to start during the fourth quarter of FY94 and will be completed during the first quarter of FY95. Over the last nine years, a number of Government agencies (EPA, Army, AF, and DOE) and industries sponsored further development and testing of the in situ heating and soil decontamination process for the remediation of soils containing hazardous organic contaminants. In this process the soil is heated in situ using electrical energy. The contaminants are removed from the soil due to enhanced vaporization, steam distillation and stripping. IITRI will demonstrate the EM Process for in situ soil decontamination at K-25 Site under the proposed treatability study. Most of the contaminants of concern are volatile organics which can be removed by heating the soil to a temperature range of 85° to 95°C. The efficiency of the treatment will be determined by comparing the concentration of contaminants in soil samples. Samples will be obtained before and after the demonstration for a measurement of the concentration of contaminants of concern. This document is a Treatability Study Work Plan for the demonstration program. The document contains a description of the proposed treatability study, background of the EM heating process, description of the field equipment, and demonstration test design.

7302 (DOE/OR/22160–T15) **Demonstration testing and evaluation of in situ soil heating. Health and safety plan (Revision 2).** Dev, H. IIT Research Inst., Chicago, IL (United States). 28 Dec 1994. 180p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-93OR22160. Order Number DE95004859. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the Health and Safety Plan (HASP) for the demonstration of IITRI's EM Treatment Technology. In this process, soil is heated in situ by means of electrical energy for the removal of hazardous organic contaminants. This process will be demonstrated on a small plot of contaminated soil located in the Pit Area of Classified Burial Ground K-1070-D, K-25 Site, Oak Ridge, TN. The purpose of the demonstration is to remove organic contaminants present in the soil by heating to a temperature range of 85° to 95°C. The soil will be heated in situ by applying 60-Hz AC power to an array of electrodes placed in boreholes drilled through the soil. In this section a brief description of the process is given along with a description of the site and a listing of the contaminants found in the area.

7303 (DOE/RL–93-43) **Limited field investigation report for the 100-HR-3 operable unit.** Department of Energy, Richland,

WA (United States). Richland Operations Office. Sep 1994. 137p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004867. Source: OSTI; NTIS; INIS; GPO Dep.

This limited field investigation (LFI) was conducted to assess the applicability of interim remedial measures (IRM) for reducing human health and environmental risks within the 100-HR-3 Groundwater Operable Unit. The 100-HR-3 Operable Unit is comprised of three subareas; the 100 D Area, the 100 H Area and those portions of the 600 Area between the two reactor areas. The operable unit is one of seven operable units associated with the 100 D and H Areas. Operable units 100-DR-1, 100-DR-2, 100-DR-3, 100-HR-1, 100-HR-2 and 100-IU-4 address contaminant sources while 100-HR-3 addresses contamination present in the underlying groundwater. The primary method of field investigation used during this LFI was the installation and sampling of monitoring wells. Samples were collected from the groundwater and soils, and submitted for laboratory analysis. Boreholes were surveyed for radiological contamination using downhole geophysical techniques to further delineate the locations and levels of contaminants. All samples were screened to ascertain the presence of volatile organic compounds and radionuclides. Analytical data were subjected to validation; all round one, two and three and a minimum of 10% of round four data associated with the LFI were validated. A screening method was used to identify contaminants of potential concern (COPC). This screening method eliminated from further consideration, constituents that were below background. Constituents which are considered non-toxic to humans were eliminated from the human health evaluation. Data consistency and blank contamination were also evaluated in the screening process. These COPC were then evaluated further in the qualitative risk assessment (QRA). A human health QRA was performed using conservative (maximum equilibrated contaminant levels from the LFI) analyses.

7304 (DOE/RL–93-78) **Limited field investigation report for the 100-KR-1 operable unit.** Department of Energy, Richland, WA (United States). Richland Operations Office. Aug 1994. 198p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004866. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site Hear Richland, Washington was used by the U.S. Government to produce plutonium for nuclear weapons. The U.S. Department of Energy (DOE) currently manages the site that contains six operational areas. The U.S. Environmental Protection Agency (EPA) placed four of these six areas (the 100, 200, 300, and 1100 Areas) on the National Priorities List (NPL) in November 1989, under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980. The Hanford Federal Facility Agreement and Consent Order subdivided the individual operational areas into source and groundwater operable units 2based on waste disposal information, location, facility type, and other site characteristics. Source operable units include facilities and unplanned release sites that are potential sources of hazardous substance contamination. The 100-KR-1 operable unit is a source operable unit within the 100 Area. Data collection and analysis activities conducted at the 100-KR-1 source operable unit during the limited field investigation (LFI) and the qualitative risk assessment (QRA) are summarized in this report. The purpose of the report is to evaluate available information and provide sufficient rationale to select sites for implementation of interim remedial measures (IRM).

7305 (DOE/RL–93-98) **Pilot-scale treatability test plan for the 200-BP-5 operable unit.** Department of Energy, Richland, WA (United States). Richland Operations Office. Aug 1994. 170p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004868. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the treatability test plan for pilot-scale pump and treat testing at the 200-BP-5 Operable Unit. This treatability test plan has been prepared in response to an agreement between the U.S. Department of Energy (DOE), the U.S. Environmental Protection Agency (EPA), and the State of Washington Department of Ecology (Ecology), as documented in Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement, Ecology et al. 1989a) Change Control Form M-13-93-03 (Ecology et al. 1994) and a recent 200 NPL Agreement Change Control Form (Appendix A). The agreement also requires that, following completion of the activities described in this test plan, a 200-BP-5 Operable Unit Interim Remedial Measure (IRM) Proposed Plan be developed for use in preparing an Interim Action Record of Decision (ROD). The IRM Proposed Plan will be supported by the results of this treatability test plan, as well as by other 200-BP-5 Operable Unit activities (e.g., development of a qualitative risk assessment). Once issued, the Interim Action ROD will specify the interim action(s) for groundwater contamination at the 200-BP-5 Operable Unit. The treatability test approach is to conduct a pilot-scale pump and treat test for each of the two contaminant plumes associated with the 200-BP-5 Operable Unit. Primary contaminants of concern are ^{99}Tc and ^{60}Co for underwater affected by past discharges to the 216-BY Cribs, and ^{90}Sr, $^{239/240}$Pu, and Cs for groundwater affected by past discharges to the 216-B-5 Reverse Well. The purpose of the pilot-scale treatability testing presented in this testplan is to provide the data basis for preparing an IRM Proposed Plan. To achieve this objective, treatability testing must: Assess the performance of groundwater pumping with respect to the ability to extract a significant amount of the primary contaminant mass present in the two contaminant plumes.

7306 (DOE/RL–94-54) **Pilot-scale treatability test plan for the 100-HR-3 operable unit.** Department of Energy, Richland, WA (United States). Richland Operations Office. Aug 1994. 74p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004871. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the treatability test plan for pilot-scale pump-and-treat testing at the 100-HR-3 Operable Unit. The test will be conducted in fulfillment of interim Milestone M-15-06E to begin pilot-scale pump-and-treat operations by August 1994. The scope of the test was determined based on the results of lab/bench-scale tests (WHC 1993a) conducted in fulfillment of Milestone M-15-06B. These milestones were established per agreement between the U.S. Department of Energy (DOE), the Washington State Department of Ecology and the U.S. Environmental Protection Agency (EPA), and documented on Hanford Federal of Ecology Facility Agreement and Consent Order Change Control Form M-15-93-02. This test plan discusses a pilot-scale pump-and-treat test for the chromium plume associated with the D Reactor portion of the 100-HR-3 Operable Unit. Data will be collected during the pilot test to assess the effectiveness, operating parameters, and resource needs of the ion exchange (IX) pump-and-treat system. The test will provide information to assess the ability to remove contaminants by extracting groundwater from wells and treating extracted groundwater using IX. Bench-scale tests were conducted previously in which chromium VI was identified as the primary contaminant of concern in the 100-D reactor plume. The DOWEX 21K™ resin was recommended for pilot-scale testing of an IX pump-and-treat system. The bench-scale test demonstrated that the system could remove chromium VI from groundwater to concentrations less than 50 ppb. The test also identified process parameters to monitor during pilot-scale testing. Water will be re-injected into the plume using wells outside the zone of influence and upgradient of the extraction well.

7307 (DOE/SR/18445–T1) **Infrastructure support for the Waste Management Institute at North Carolina A&T State University. Progress report, September 1994–January 1995.** Uzochukwu, G.A. North Carolina Agricultural and Technical State Univ., Greensboro, NC (United States). 25 Jan 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG09-94SR18445. Order Number DE95005776. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Waste Management Institute is two-fold: (1) to enhance awareness and understanding of waste problems and their management in our society and, (2) to provide leadership in research, instruction and outreach to improve the quality of life on a global scale and protect the environment.

7311 (EGG-WM–11049) **Aggradational and erosional history of the Radioactive Waste Management Complex at the Idaho National Engineering Laboratory.** Dechert, T.V. (Idaho Univ., Moscow, ID (United States)); McDaniel, P.A.; Falen, A.L. EG and G Idaho, Inc., Idaho Falls, ID (United States); Idaho Univ., Moscow, ID (United States). Sep 1994. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95002018. Source: OSTI; NTIS; INIS; GPO Dep.

Long-term performance of the low-level waste disposal site at the Radioactive Waste Management Complex (RWMC) is partially dependent on the stability of the land surface with respect to erosion of cover materials. This document discusses the aggradational and erosional history of the naturally occurring sediments and soils in and around the RWMC, focusing on the late-Pleistocene and Holocene epochs. Other related issues include the ages of the various deposits, the extent to which they have been altered by soil formation and other processes, their relationships to the basalt flows in the area, and the impact of human activity on the materials at the RWMC.

7312 (EGG-WM–11467) **Hazards assessment for the Waste Experimental Reduction Facility.** Calley, M.B.; Jones, J.L. Jr. EG and G Idaho, Inc., Idaho Falls, ID (United States). 19 Sep 1994. 175p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95002019. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the hazards assessment for the Waste Experimental Reduction Facility (WERF) located at the Idaho National Engineering Laboratory, which is operated by EG&G Idaho, Inc., for the US Department of Energy (DOE). The hazards assessment was performed to ensure that this facility complies with DOE and company requirements pertaining to emergency planning and preparedness for operational emergencies. DOE Order 5500.3A requires that a facility-specific hazards assessment be performed to provide the technical basis for facility emergency planning efforts. This hazards assessment was conducted in accordance with DOE Headquarters and DOE Idaho Operations Office (DOE-ID) guidance to comply with DOE Order 5500.3A. The hazards assessment identifies and analyzes hazards that are significant enough to warrant consideration in a facility's operational emergency management program. This hazards assessment describes the WERF, the area surrounding WERF, associated buildings and structures at WERF, and the processes performed at WERF. All radiological and nonradiological hazardous materials stored, used, or produced at WERF were identified and screened. Even though the screening process indicated that the hazardous materials could be screened from further analysis because the inventory of radiological and nonradiological hazardous materials were below the screening thresholds specified by DOE and DOE-ID guidance for DOE Order 5500.3A, the nonradiological hazardous materials were analyzed further because it was felt that the nonradiological hazardous material screening thresholds were too high.

7313 (ES/ER/TM–102/R1) **Waste generation forecast for DOE-ORO's Environmental Restoration OR-1 Project: FY 1995-FY 2002, September 1994 revision.** Oak Ridge National Lab., TN (United States). Dec 1994. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004874. Source: OSTI; NTIS; INIS; GPO Dep.

A comprehensive waste-forecasting task was initiated in FY 1991 to provide a consistent, documented estimate of the volumes of waste expected to be generated as a result of U.S. Department of Energy-Oak Ridge Operations (DOE-ORO) Environmental Restoration (ER) OR-1 Project activities. Continual changes in the scope and schedules for remedial action (RA) and decontamination and decommissioning (D&D) activities have required that an integrated data base system be developed that can be easily revised to keep pace with changes and provide appropriate tabular and graphical output. The output can then be analyzed and used to drive planning assumptions for treatment, storage, and disposal (TSD) facilities. The results of this forecasting effort and a description of the data base developed to support it are provided herein. The initial waste-generation forecast results were compiled in November 1991. Since the initial forecast report, the forecast data have been revised annually. This report reflects revisions as of September 1994.

7314 (GSF–10/94) **Calculation of the radiation transport in rock salt using Monte Carlo methods. Final report. HAW project.** Till, E.; Zankl, M.; Regulla, D. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Neuherberg (Germany). Inst. fuer Strahlenschutz. Jan 1994. 528p. Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany);Commission of the European Communities, Brussels (Belgium). Contract CEC FI2W-CT90-0002. Order Number DE95738784. Source: OSTI; NTIS (US Sales Only); INIS.

This report provides absorbed dose rate and photon fluence rate distributions in rock salt around 30 testwise emplaced canisters containing high-level radioactive material (HAW project) and around a single canister containing radioactive material of a lower activity level (INHAW experiment). The site of this test emplacement was located in test galleries at the 800-m-level in the Asse salt mine. The data given were calculated using a Monte Carlo method simulating photon transport in complex geometries of differently composed materials. The aim of these calculations was to enable determination of the dose absorbed in any arbitrary sample of salt to be further examined in the future with sufficient reliability. The geometry of the test arrangement, the materials involved and the calculational method are characterised and the results are shortly described and some figures presenting selected results are shown. In the appendices, the results for emplacement of the highly radioactive canisters are given in tabular form. (orig.)

7315 (HLW-TEC–940020) **High-level waste management technology program plan.** Harmon, H.D. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95004828. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this plan is to document the integrated technology program plan for the Savannah River Site (SRS) High-Level Waste (HLW) Management System. The mission of the SRS HLW System is to receive and store SRS high-level wastes in a see and environmentally sound, and to convert these wastes into forms suitable for final disposal. These final disposal forms are borosilicate glass to be sent to the Federal Repository, Saltstone grout to be disposed of on site, and treated waste water to be released to the environment via a permitted outfall. Thus, the technology development activities described herein are those activities required to enable successful accomplishment of this mission. The technology program is based on specific needs of the SRS HLW System and organized following the systems engineering level 3 functions. Technology needs for each level 3 function are listed as reference, enhancements, and alternatives. Finally, FY-95 funding, deliverables, and schedules are s in Chapter IV with details on the

specific tasks that are funded in FY-95 provided in Appendix A. The information in this report represents the vision of activities as defined at the beginning of the fiscal year. Depending on emergent issues, funding changes, and other factors, programs and milestones may be adjusted during the fiscal year. The FY-95 SRS HLW technology program strongly emphasizes startup support for the Defense Waste Processing Facility and In-Tank Precipitation. Closure of technical issues associated with these operations has been given highest priority. Consequently, efforts on longer term enhancements and alternatives are receiving minimal funding. However, High-Level Waste Management is committed to participation in the national Radioactive Waste Tank Remediation Technology Focus Area. 4 refs., 5 figs., 9 tabs.

7316 (INIS-mf–14431) **The radioactive waste safety standards (RADWASS) programme. A series of international consensus documents on the safe management and disposal of radioactive waste.** International Atomic Energy Agency, Vienna (Austria). Feb 1992. 16p. (STI/PUB–901.). Order Number DE95613230. Source: OSTI; NTIS (US Sales Only); INIS.

IAEA publishes Safety Series on the subject of waste management, covering important areas. The Radioactive Waste Safety Standards (RADWASS) series is being developed to (i) improve the visibility and status of IAEA publication related to safety aspects of waste management; and (ii) impose a more logical structure on safety publications in the waste management area. In this document some technical areas of waste management are identified and related planned publications are listed.

7317 (INIS-mf–14432) **Waste management assessment and technical review programme. WATRP. An international peer review service for radioactive waste management activities.** International Atomic Energy Agency, Vienna (Austria). Sep 1994. 12p. (IAEA-WATRP–94.). Order Number DE95613231. Source: OSTI; NTIS (US Sales Only); INIS.

International Atomic Energy Agency provides international peer review services in radioactive waste management to those Member States that have established radioactive waste management programmes. Such services are provided within Waste Management Assessment and Technical Review Programme (WATRP). The main objective of WATRP is to provide international expertise and information on a requested subject in the field of radioactive waste management and to validate that programmes and activities are sound and performing well. Refs, figs and tabs.

7318 (INIS-mf–14435, pp. MC6.1-MC6.5) **Applications of multicriteria decision making methods in Czech nuclear energetics.** Halova, J. (Academy of Sciences of the Czech Republic, Institute of Inorganic Chemistry, Prague (Czech Republic)). No corporate text available. Oct 1993. 100p. (CONF-9310403–: The mining Pribram in science and technology, Pribram (Czech Republic), 13-16 Oct 1993). In *The mining Pribram in science and technology. Section MC: Mathematical methods in geology.* Order Number DE95613232. Source: OSTI; NTIS (US Sales Only); INIS.

Criteria are given for the choice of an optimum radioactive waste management method as well as their normalized weights. The highest value was assigned to the criterion 'Product quality' (0.1702). The aspects of quality criteria for bituminized nuclear reactor wastes are presented; the most important aspects of product quality are chemical durability (3.157) and leachability (2.556) of biotoxic radionuclides. Results are also presented of a multicriterial risk evaluation of alternative energy sources; it is concluded that coal is the least favorable energy source. (J.B.) 9 refs.

7319 (Juel–2834) **The chemical behaviour of iodine-129 in the process of radwaste conditioning.** Schon, T. Forschungszentrum Juelich GmbH (Germany). Inst. fuer Sicherheitsforschung und Reaktortechnik; Technische Hochschule Aachen (Germany). Nov 1993. 92p. (In German). Order Number DE95738857. Source: OSTI; NTIS (US Sales Only); INIS.

During radwaste reprocessing, elemental I-129 may almost completely be transferred to the dissolver off-gas stream. The AC 6120 adsorbent, consisting of high-heated, amorphous silicic acid impregnated with silver nitrate, proved to be particularly efficient for removing the iodine from the off-gas. In a gas-solid reaction, the elemental iodine is converted into solid silver iodide and silver iodate. The reaction's stoichiometry depends on the loading temperature, with temperatures between 30 and 80 C resulting in a ratio of five between the reaction products of AgI and $AgIO_3$, while with temperatures higher than that, up to 150 C, the ratio is three. For assessing the acceptability of the iodine-bearing AC 6120 as a waste product to be emplaced in a salt rock repository, the ratio of the reaction products is one of the main criteria. The products solubility and its complexation reactions with chloride-bearing brines are two other important criteria, especially with a view to the not completely hypothetical accident type of 'water ingress into the salt cavern'. Leaching experiments have shown that in this event, between 30 and over 60% of the waste product's iodine inventory would be leached out within only seven days. Thus AC 6120 is not a candidate adsorbent for immobilization of iodine 129 in a waste product. (orig./HP)

7320 (KAERI/RR–1325/93) **A study on the radioactive waste management for DUPIC fuel cycle - A study on the direct use of spent PWR fuel in CANDU.** Park, Hyeon Soo (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Chun, Kwan Sik; Kim, Jong Ho; Cho, Yeong Hyeon; Paek, Seung Uh; Kang, Hee Seok; Na, Jeong Won; Choi, Jong Won; Lee, Hu Keun; Park, Keun Il; Yang, Seung Yeong. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 129p. (In Korean). Order Number DE95613236. Source: OSTI; NTIS; INIS.

The characteristics of the radioactive wastes coming from the DUPIC fuel manufacturing process were analyzed and evaluated. The release amounts of nuclides were estimated, and the characteristics of the oxides of semi-volatile nuclides such as Ru and Cs were analyzed and also these trapping and fixation technologies were assessed. The conceptual methods of experiment including apparatus and procedure were completed to define the vaporization behavior of nuclides. The gross α-activity and α-, γ-spectrum of irradiated zircaloy specimens from KORI unit 1 were analyzed and the press to test the compaction of hulls was manufactured. Ingestion hazard index for the disposal of spent DUPIC fuel were calculated using ORIGEN 2 code and compared with the disposal of once-through spent PWR and CANDU fuels, and then the index per kwh for DUPIC cycle was $1/8 \approx 1/4$ lower than that for once-through cycle. (Author).

7321 (KFK–5326, pp. 115-131) **Actinide burning in fast reactors. KfK contributions to the CAPRA code.** Heusener, G. (Kernforschungszentrum Karlsruhe (Germany)); Muehling, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. (In German). (CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). In *Papers presented as part of the status report of the Nuclear Safety Research Project of the Karlsruhe Nuclear Center on 23 March 1994.* 284p. Order Number DE95738354. Source: OSTI; NTIS (US Sales Only); INIS.

The CAPRA program performs a feasibilty study of the possibilities of Pu burning, and of transmutation of minor actinides in optimized fast reactors. The KfK takes part in the program priorities of neutron physics core designs, safety experiments with optimized cores, and fuel studies. (DG)

7322 (KFK–5328) **PROSDOR: An IBM-3090 based semi-automated procedure linking HERMES MCNP and KORIGEN for the burnup analysis of accelerator driven cores.** Segev, M. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jul 1994. 26p. Order Number DE95738239. Source: OSTI; NTIS (US Sales Only); INIS.

This report guides the user of PROSDOR in the execution of the various calculational steps needed to carry out a burnup study of a fission subcritical target driven by high energy protons. The introduction of the files and programs involved is made in close reference to the procedural chronological execution steps. The PROSDOR is a dedicated linkage between the HERMES, MCNP, and KORIGEN codes. At this point it is limited to a cylindrical homogeneous target, enabling the analysis of a truely homogeneous core or a hard spectrum lattice, with planned upgrading. (orig.)

7323 (LA–12889) **Distributions of 12 elements on 64 absorbers from simulated Hanford Neutralized Current Acid Waste (NCAW).** Svitra, Z.V. (Los Alamos National Lab., NM (United States)); Bowen, S.M.; Marsh, S.F. Los Alamos National Lab., NM (United States). Dec 1994. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005651. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Hanford Tank Waste Remediation System program at Los Alamos, we evaluated 64 commercially available or experimental absorber materials for their ability to remove hazardous components from high-level waste. These absorbers included cation and anion exchange resins, inorganic exchangers, composite absorbers, and a series of liquid extractants sorbed on porous support-beads. We tested these absorbers with a solution that simulates Hanford neutralized current acid waste (NCAW) (pH 14.2). To this simulant solution we added the appropriate radionuclides and used gamma spectrometry to measure fission products (Cs, Sr, Tc, and Y) and matrix elements (Cr, Co, Fe, Mn, Ni, V, Zn, and Zr). For each of 768 element/absorber combinations, we measured distribution coefficients for dynamic contact periods of 30 min, 2 h, and 6 h to obtain information about sorption kinetics. On the basis of these 2304 measured distribution coefficients, we determined that many of the tested absorbers may be suitable for processing NCAW solutions.

7324 (LA-UR–94-3483) **Soil pore-gas sampling by photoacoustic radiometry.** Sollid, J.E. Los Alamos National Lab., NM (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9411144–1: Optical sensing for environmental and process monitoring, McLean, VA (United States), 7-10 Nov 1994). Order Number DE95002717. Source: OSTI; NTIS; INIS; GPO Dep.

Concentrations of volatile organics in a soil pore-gas plume were measured using a commercially available multigas monitor. The monitor is a photoacoustic radiometer (PAR) controlled by an onboard, programmable microprocessor. The measurements determine the extent and location of the vapor plume in the subsurface. At least twelve wells surrounding the sources are measured quarterly. The sources are located in former liquid chemical waste disposal pits and shafts at Los Alamos National Laboratory. The primary constituents of the plume are 1,1,1 trichloroethane (TCA), trichloroethene (TCE), and tetrachloroethene or perchloroethene or perchloroethene (PCE). Four quarters of data are presented for TCA. All were used primarily as solvents and degreasers. Previously the composition of the vapor plume was determined by Gas Chromatography Mass Spectrometer GCMS methods. Photoacoustic radiometry and gas chromatography are discussed giving the advantages and disadvantages of each method, although in this program they are basically complementary. Gas chromatography is a more qualitative method to determine which analytes are present and the approximate concentration. Photoacoustic radiometry, to function well, requires foreknowledge of constituents and serves best to determine how much is present. Measurements are quicker and more direct with photoacoustic methods. Once the constituents to be measured are known, the cost to monitor is much less using photoacoustics, and the results are available more quickly.

7325 (LA-UR–94-4371) **Funneling in LANL high intensity linac designs.** Nath, S. Los Alamos National Lab., NM (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9407103–33: International conference on accelerator-driven transmutation technologies and applications, Las Vegas, NV (United States), 25-28 Jul 1994). Order Number DE95005244. Source: OSTI; NTIS; INIS; GPO Dep.

The Los Alamos design approach to Accelerator driven transmutation applications is based on high power proton linacs. Most of the accelerators that have been studied have one important element in common. That component is a funnel, where beams from two separate but identical front end linac systems are merged to form a collinear beam of twice the initial beam intensity. The nominal linac design for Accelerator Transmutation of Waste (ATW) consists of an ion source-injector/Radio Frequency Quadrupole (RFQ)/Drift Tube Linac (DTL) combination operating at 350 MHz. The output beam at 20 MeV from each of the DTLs is then funneled to a single high energy linac operating at 700 MHz which achieve higher beam intensity, a beam dynamics design, and simulation results through the funnel section, together with the present experimental status of funneling.

7326 (LBL–34468) **Development of analytical and numerical models for the assessment and interpretation of hydrogeological field tests.** Mironenko, V.A. (St. Petersburg Mining Inst. (Russian Federation)); Rumynin, V.G.; Konosavsky, P.K.; Pozdniakov, S.P.; Shestakov, V.M.; Roshal, A.A. Lawrence Berkeley Lab., CA (United States). Jul 1994. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95006725. Source: OSTI; NTIS; INIS; GPO Dep.

Mathematical models of the flow and tracer tests in fractured aquifers are being developed for the further study of radioactive wastes migration in round water at the Lake Area, which is associated with one of the waste disposal site in Russia. The choice of testing methods, tracer types (chemical or thermal) and the appropriate models are determined by the nature of the ongoing ground-water pollution processes and the hydrogeological features of the site under consideration. Special importance is attached to the increased density of wastes as well as to the possible redistribution of solutes both in the liquid phase and in the absorbed state (largely, on fracture surfaces). This allows for studying physical-and-chemical (hydrogeochemical) interaction parameters which are hard to obtain (considering a fractured structure of the rock mass) in laboratory. Moreover, a theoretical substantiation is being given to the field methods of studying the properties of a fractured stratum aimed at the further construction of the drainage system or the subsurface flow barrier (cutoff wall), as well as the monitoring system that will evaluate the reliability of these ground-water protection measures. The proposed mathematical models are based on a tight combination of analytical and numerical methods, the former being preferred in solving the principal (2D axisymmetrical) class of the problems. The choice of appropriate problems is based on the close feedback with subsequent field tests in the Lake Area. 63 refs.

7327 (LBL–36385) **Computer simulation of radionuclide transport through thermal convection of groundwater from borehole repositories.** Malkovsky, V.I. (Russian Academy of Sciences, Moscow (Russian Federation). Inst. of Geology of Ore Deposits, Petrography, Mineralogy and Geochemistry); Pek, A.A. Lawrence Berkeley Lab., CA (United States). Sep 1993. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95006722. Source: OSTI; NTIS; INIS; GPO Dep.

Results are presented of numerical modeling of radionuclide transport by thermal convection of groundwater from a single well repository of high level waste. Because the problem possesses cylindrical symmetry, the process is described by a system of 2-D transient equations for momentum, convective heat transfer and convective mass transfer (taking into account hydrodynamic dispersion and radionuclide decay). Results of computer simulations for a selected range of system parameters were generalized by approximating analytical relationship, which can be used for safety assessment of a radioactive waste repository. The problem of the reciprocal relationship between thermoconvective transport processes and well spacing in an underground repository with a regularly spaced set of the waste-loaded wells is examined using a two-well model as an example. In this case, the transport problem becomes three-dimensional. A solution to this problem was obtained using a special system of orthogonal coordinates, which simplifies the computational algorithm and enhances accuracy. It is shown that thermoconvective transport of radionuclides in the vicinity of each well can be considered to be independent at well separations of the order of 100 m when reasonable values of other repository parameters are assumed.

7328 (LBL–36387) **Modeling of the fault-controlled hydrothermal ore-forming systems.** Pek, A.A. (Russian Academy of Sciences, Moscow (Russian Federation). Inst. of Geology of Ore Deposits, Petrography, Mineralogy and Geochemistry); Malkovsky, V.I. Lawrence Berkeley Lab., CA (United States). Jul 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC03-76SF00098. Order Number DE95006726. Source: OSTI; NTIS; INIS; GPO Dep.

A necessary precondition for the formation of hydrothermal ore deposits is a strong focusing of hydrothermal flow as fluids move from the fluid source to the site of ore deposition. The spatial distribution of hydrothermal deposits favors the concept that such fluid flow focusing is controlled, for the most part, by regional faults which provide a low resistance path for hydrothermal solutions. Results of electric analog simulations, analytical solutions, and computer simulations of the fluid flow, in a fault-controlled single-pass advective system, confirm this concept. The influence of the fluid flow focusing on the heat and mass transfer in a single-pass advective system was investigated for a simplified version of the metamorphic model for the genesis of greenstone-hosted gold deposits. The spatial distribution of ore mineralization, predicted by computer simulation, is in reasonable agreement with geological observations. Computer simulations of the fault-controlled thermo-convective system revealed a complex pattern of mixing hydrothermal solutions in the model, which also simulates the development of the modern hydrothermal systems on the ocean floor. The specific feature of the model considered, is the development under certain conditions of an intra-fault convective cell that operates essentially independently of the large scale circulation. These and other results obtained during the study indicate that modeling of natural fault-controlled hydrothermal systems is instructive for the analysis of transport processes in man-made hydrothermal systems that could develop in geologic high-level nuclear waste repositories.

7329 (LBL–36467) **Combined analysis of surface reflection imaging and vertical seismic profiling at Yucca Mountain, Nevada.** Daley, T.M. (Lawrence Berkeley Lab., CA (United States). Earth Sciences Div.); Majer, E.L.; Karageorgi, E. Lawrence Berkeley Lab., CA (United States). Aug 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95006724. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents results from surface and borehole seismic profiling performed by the Lawrence Berkeley Laboratory (LBL) on Yucca Mountain. This work was performed as part of the site characterization effort for the potential high-level nuclear waste repository. Their objective was to provide seismic imaging from the near surface (200 to 300 ft. depth) to the repository horizon and below, if possible. Among the issues addressed by this seismic imaging work are location and depth of fracturing and faulting, geologic identification of reflecting horizons, and spatial continuity of reflecting horizons. The authors believe their results are generally positive, with tome specific successes. This was the first attempt at this scale using modem seismic imaging techniques to determine geologic features on Yucca Mountain. The principle purpose of this report is to present the interpretation of the seismic reflection section in a geologic context. Three surface reflection profiles were acquired and processed as part of this study. Because of environmental concerns, all three lines were on preexisting roads. Line 1 crossed the mapped surface trace of the Ghost Dance fault and it was intended to study the dip and depth extent of the fault system. Line 2 was acquired along Drill Hole wash and was intended to help the ESF north ramp design activities. Line 3 was acquired along Yucca Crest and was designed to image geologic horizons which were thought to be less faulted along the ridge. Unfortunately, line 3 proved to have poor data quality, in part because of winds, poor field conditions and limited time. Their processing and interpretation efforts were focused on lines 1 and 2 and their associated VSP studies.

7330 (LBL–36614) **Progress on flow visualization and relative permeability measurement in transparent replicas of natural fractures from Yucca Mountain.** Persoff, P. (Lawrence Berkeley Lab., CA (United States). Earth Sciences Div.); Pruess, K.; Petersen, L.P. Lawrence Berkeley Lab., CA (United States). Jan 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95006723. Source: OSTI; NTIS; INIS; GPO Dep.

Small sections (75 mm x 75 mm) of two natural rock fractures from outcrop boulders of Tiva Canyon tuff have been reproduced as transparent replicas. Aperture maps were drawn from images of the replicas filled with dye. Apertures were measured by the areas occupied by liquid drops of known volume. For both these fractures, the average aperture is about 350 μm, while the hydraulic aperture is less (72 and 130 μm). Two-phase (air-water) flow experiments have been conducted in these replicas to measure relative permeability and capillary pressures. The results obtained confirm the results of previous fracture experiments, and theoretical analysis, that the sum of relative permeabilities is much less than 1 at intermediate saturations. The welded tuffs in the vadose zone of Yucca Mountain, Nevada, are being investigated as the potential site of a geological repository for high-level nuclear wastes.

7331 (LUTVDG-TVVR–1011) **Contaminant migration in rock aquifers.** Dahlbom, P. Lund Univ. (Sweden). Dept. of Water Resources Engineering. 28 Oct 1994. 183p. Order Number DE95613249. Source: OSTI; NTIS; INIS.

This work deals with fractured rock as a host for deposits of hazardous waste. A literature review of modelling approaches and methods for field investigations concerning flow and migration in fractured rock is given. The literature study on field observations shows that the water flow in fractured rock is unevenly distributed, which contradicts the porous medium approach. Some idealized examples are given to investigate where to find low hydraulic gradients. The ability of a laminar pipe-flow model to reproduce the hydrodynamic transport of contaminated groundwater in fractured rock is investigated. It is assumed that the cross-section areas in an ensemble of tubes have a gamma distribution. The model is applied to field tracer experiments at two sites. An attempt is made to model a fracture with irregular aperture as a two-dimensional stochastic process with known correlation structure. It is assumed that the fracture aperture is lognormally distributed, and that the flow is laminar. A particle following algorithm is applied. A comparison with the porous medium approach, and with the laminar pipe flow model is made. 135 refs, 41 figs, 4 tabs.

7332 (NEI-SE–170) **Radioactive waste processing and disposal. A complement to the program 1992.** Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Aug 1994. 121p. (In Swedish). Order Number DE95613233. Source: OSTI; NTIS; INIS.

The report is a complement to a previous report (published 1992) about the Swedish program of processing and disposal of radioactive waste from the Swedish nuclear power reactors. 14 refs, figs, tabs.

7333 (ORNL/ER/Sub–87-99053/28) **Selection of liquid-level monitoring method for the Oak Ridge National Laboratory inactive liquid low-level waste tanks, remedial investigation/feasibility study.** Oak Ridge National Lab., TN (United States); Bechtel Environmental, Inc., Oak Ridge, TN (United States); CH2M Hill Southeast, Inc., Oak Ridge, TN (United States); Ogden Environmental and Energy Services Co., Oak Ridge, TN (United States); Peer Consultants, Inc., Oak Ridge, TN (United States). Nov 1994. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Subcontract 12B-99053C. Order Number DE95004736. Source: OSTI; NTIS; INIS; GPO Dep.

Several of the inactive liquid low-level waste (LLLW) tanks at Oak Ridge National Laboratory contain residual wastes in liquid or solid (sludge) form or both. A plan of action has been developed to ensure that potential environmental impacts from the waste remaining in the inactive LLLW tank systems are minimized. This document describes the evaluation and selection of a methodology for monitoring the level of the liquid in inactive LLLW tanks. Criteria are established for comparison of existing level monitoring and leak testing methods; a preferred method is selected and a decision methodology for monitoring the level of the liquid in the tanks is presented for implementation. The methodology selected can be used to continuously monitor the tanks pending disposition of the wastes for treatment and disposal. Tanks that are empty, are scheduled to be emptied in the near future, or have liquid contents that are very low risk to the environment were not considered to be candidates for installing level monitoring. Tanks requiring new monitoring equipment were provided with conductivity probes; tanks with existing level monitoring instrumentation were not modified.

The resulting data will be analyzed to determine inactive LLLW tank liquid level trends as a function of time.

7334 (ORNL/TM–12708) **Removal of cesium from aluminum decladding wastes generated in irradiated target processing using a fixed-bed column of resorcinol-formaldehyde resin.** Brunson, R.R.; Williams, D.F.; Bond, W.D.; Benker, D.E.; Chattin, F.R.; Collins, E.D. Oak Ridge National Lab., TN (United States). Sep 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004784. Source: OSTI; NTIS; INIS; GPO Dep.

The removal of cesium (Cs) from a low-level liquid waste (LLLW) with a cation-exchange column was demonstrated using a resorcinol-formaldehyde (RF) resin. The RF resin was developed at the Westinghouse Savannah River Laboratory (SRL) and is highly specific for the removal of Cs from an alkaline waste of high sodium content. It was determined that the RF resin would be suitable for removing Cs, the largest gamma radiation contributor, from the LLLW generated at the Radiochemical Engineering Development Center located at the Oak Ridge National Laboratory. Presently, the disposal of the LLLW is limited due to the amount of Cs contained in the waste. Cesium removal from the waste solution offers immediate benefits by conserving valuable tank space and would allow cask shipments of the treated waste should the present Laboratory pipelines become unavailable in the future. Preliminary laboratory tests of the RF resins, supplied from two different sources, were used to design a full-scale cation-exchange column for the removal of Cs from a Mark 42 SRL fuel element dejacketing waste solution. The in-cell tests reproduced the preliminary bench-scale test results. The initial Cs breakthrough range was 85–92 column volumes (CV). The resin capacity for Cs was found to be ~0.35 meq per gram of resin. A 1.5-liter resin bed loaded a combined ~1,300 Ci of ^{134}Cs and ^{137}Cs. A distribution coefficient of ~110 CV was determined, based on a 50% Cs breakthrough point. The kinetics of the system was studied by examining the rate parameters; however, it was decided that several more tests would be necessary to define the mass transfer characteristics of the system.

7335 (ORNL/TM–12823) **Bench-scale treatability studies for simulated incinerator scrubber blowdown containing radioactive cesium and strontium.** Coroneos, A.C. (Oak Ridge National Lab., TN (United States)); Taylor, P.A.; Arnold, W.D. Jr.; Bostick, D.A.; Perona, J.J. Oak Ridge National Lab., TN (United States). Dec 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95005997. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to document the results of bench-scale testing completed to remove ^{137}Cs and ^{90}Sr from the Oak Ridge K-25 Site Toxic Substances Control Act (TSCA) Incinerator blowdown at the K-25 Site Central Neutralization Facility, a wastewater treatment facility designed to remove heavy metals and uranium from various wastewaters. The report presents results of bench-scale testing using chabazite and clinoptilolite zeolites to remove cesium and strontium; using potassium cobalt ferrocyanide (KCCF) to remove cesium; and using strontium chloride coprecipitation, sodium phosphate coprecipitation, and calcium sulfate coprecipitation to remove strontium. Low-range, average-range, and high-range concentration blowdown surrogates were used to complete the bench-scale testing.

7336 (ORNL/TM–12828) **Operating cost guidelines for benchmarking DOE thermal treatment systems for low-level mixed waste.** Salmon, R.; Loghry, S.L.; Hermes, W.H. Oak Ridge National Lab., TN (United States). Nov 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004734. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents guidelines for estimating operating costs for use in benchmarking US Department of Energy (DOE) low-level mixed waste thermal treatment systems. The guidelines are based on operating cost experience at the DOE Toxic Substances Control Act (TSCA) mixed waste incinerator at the K-25 Site at Oak Ridge. In presenting these guidelines, it should be made clear at the outset that it is not the intention of this report to present operating cost estimates for new technologies, but only guidelines for estimating such costs.

7337 **Slanted baffle mist eliminator.** Vance, R.F. 1992. Filed date 28 Oct 1992. U.S. Patent Application 7-967,463. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-81NE44139. Order Number DE95006138. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of an apparatus for the elimination of mist from off-gas during vitrification of nuclear waste, where baffles are installed on a slant toward the flow of the off-gasses eliminating the need to expand the cross-sectional area of the duct size.

7338 (PNL–10134) **Tank waste processing analysis: Database development, tank-by-tank processing requirements, and examples of pretreatment sequences and schedules as applied to Hanford Double-Shell Tank Supernatant Waste - FY 1993.** Colton, N.G. (Pacific Northwest Lab., Richland, WA (United States)); Orth, R.J.; Aitken, E.A. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005754. Source: OSTI; NTIS; INIS; GPO Dep.

This report gives the results of work conducted in FY 1993 by the Tank Waste Processing Analysis Task for the Underground Storage Tank Integrated Demonstration. The main purpose of this task, led by Pacific Northwest Laboratory, is to demonstrate a methodology to identify processing sequences, i.e., the order in which a tank should be processed. In turn, these sequences may be used to assist in the development of time-phased deployment schedules. Time-phased deployment is implementation of pretreatment technologies over a period of time as technologies are required and/or developed. The work discussed here illustrates how tank-by-tank databases and processing requirements have been used to generate processing sequences and time-phased deployment schedules. The processing sequences take into account requirements such as the amount and types of data available for the tanks, tank waste form and composition, required decontamination factors, and types of compact processing units (CPUS) required and technology availability. These sequences were developed from processing requirements for the tanks, which were determined from spreadsheet analyses. The spreadsheet analysis program was generated by this task in FY 1993. Efforts conducted for this task have focused on the processing requirements for Hanford double-shell tank (DST) supernatant wastes (pumpable liquid) because this waste type is easier to retrieve than the other types (saltcake and sludge), and more tank space would become available for future processing needs. The processing requirements were based on Class A criteria set by the U.S. Nuclear Regulatory Commission and Clean Option goals provided by Pacific Northwest Laboratory.

7339 (PNL–10173) **Ammonia in simulated Hanford double-shell tank wastes: Solubility and effects on surface tension.** Norton, J.D.; Pederson, L.R. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95002322. Source: OSTI; NTIS; INIS; GPO Dep.

Radioactive and wastes left from defense materials production activities are temporarily stored in large underground tanks at the Hanford Site in south central Washington State (Tank Waste Science Panel 1991). Some of these wastes are in the form of a thick slurry ("double-shell slurry") containing sodium nitrate, sodium nitrite, sodium aluminate, sodium hydroxide, sodium carbonate, organic complexants and buffering agents, complexant fragments and other minor components (Herting et al. 1992a; Herting et al. 1992b; Campbell et al. 1994). As a result of thermal and radiolytic processes, a number of gases are known to be produced by some of these stored wastes, including ammonia, nitrous oxide, nitrogen, hydrogen, and methane (Babad et al. 1991; Ashby et al. 1992; Meisel et al. 1993; Ashby et al. 1993; Ashby et al. 1994; Bryan et al. 1993; US Department of Energy 1994). Before the emplacement of a mixer pump, these gases were retained in and periodically released from Tank 241-SY-101, a double-shell tank at the Hanford Site (Babad et al. 1992; US Department of Energy 1994). Gases are believed to be retained primarily in the form of bubbles attached to solid particles (Bryan, Pederson, and Scheele 1992), with very little actually dissolved in the liquid. Ammonia is

an exception. The relation between the concentration of aqueous ammonia in such concentrated, caustic mixtures and the ammonia partial pressure is not well known, however.

7340 (PNL–10176) **A survey of existing and emerging technologies for external detection of liquid leaks at the Hanford Site.** Lewis, R.E.; Teel, S.S. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95002585. Source: OSTI; NTIS; INIS; GPO Dep.

Contains 1 disk.

During the history of the Hanford Site, many structures were built that stored and transported liquids used for the production mission; some of these structures are still active. Active structures include underground storage tanks retention basins, and pipes and pipelines. Many of the liquids stored and transported in these structures are potentially hazardous to human health and the environment. Any leakage of liquids from active structures, has the added potential to mobilize contaminants in the unsaturated zone. Therefore, it is beneficial to monitor these structures for leaks. The purpose of tills report is to catalog existing and emerging technologies that have potential for the external monitoring of liquid leaks. The report will focus primarily on the needs at the Hanford Site tank farms that are located in the 200 Areas, but will also be relevant to other Hanford Site facilities. Leak detection systems, both external and internal, are currently used at some Hanford facilities. This report focuses on the detection of leaks as they migrate into the soils surrounding the facilities.

7341 (PNL–10194) **Hanford Permanent Isolation Barrier Program: Asphalt technology data and status report - FY 1994.** Freeman, H.D.; Romine, R.A.; Zacher, A.H. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005752. Source: OSTI; NTIS; INIS; GPO Dep.

The asphalt layer within the Hanford Permanent Isolation Barrier (HPIB) is an important component of the overall design. This layer provides a RCRA equivalent backup to the overlying earthen layers in the unlikely event that these layers are not able to reduce the infiltration rate to less than 0.05 cm/yr. There is only limited amount of information on using asphalt for a moisture infiltration barrier over the long times required by the HPIB. Therefore, a number of activities are under way, as part of the Barrier Development Program, to obtain data on the performance of asphalt as a moisture barrier in a buried environment over a 1000-year period. These activities include (1) determining RCRA equivalency, (2) measurement of physical properties, (3) measurement of aging characteristics, and (4) relationship to ancient asphalt analogs. During FY 1994 progress was made on all of these activities. Studies were conducted both in the laboratory and on the prototype barrier constructed over the 216-B-57 crib in the 200 East Area on the Hanford Site. This report presents results obtained from the asphalt technology tasks during FY 1994. Also included are updates to planned activities for asphalt analogs and monitoring the asphalt test pad near the prototype barrier. Measurements of hydraulic conductivity on the HMAC portion of the prototype barrier show that the asphalt layers easily meet the RCRA standard of 1×10^{-7} cm/s. In-place measurements using a new field falling head technique show an average of 3.66×10^{-8} cm/s, while cores taken from the north end of the prototype and measured in a laboratory setup averaged 1.29×10^{-9} cm/s. Measurements made on the fluid applied asphalt membrane (polymer-modified asphalt) show an extremely low permeability of less than 1×10^{-11} cm/s.

7342 (PNL–10283) **Web technology in the separation of strontium and cesium from INEL-ICPP radioactive acid waste (WM-185).** Bray, L.A.; Brown, G.N. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006368. Source: OSTI; NTIS; INIS; GPO Dep.

Strontium and cesium were successfully removed from radioactive acidic waste (WM-185) at the Idaho National Engineering Laboratory, Idaho Chemical Processing Plant (ICPP), with web technology from 3M and IBC Advanced Technologies, Inc. (IBC). A technical team from Pacific Northwest Laboratory, ICPP, 3M and IBC conducted a very successful series of experiments from August 15 through 18, 1994. The ICPP, Remote Analytical Laboratory, Idaho Falls, Idaho, provided the hot cell facilities and staff to complete these milestone experiments. The actual waste experiments duplicated the initial 'cold' simulated waste results and confirmed the selective removal provided by ligand-particle web technology.

7343 (PNL–10398-Vol.1) **K Basin spent fuel sludge treatment alternatives study. Volume 1, Regulatory options.** Beary, M.M. (Science Applications International Corp., Richland, WA (United States)); Honekemp, J.R.; Winters, N. Pacific Northwest Lab., Richland, WA (United States); Science Applications International Corp., Richland, WA (United States). Jan 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Agreement 188694-A-A2. Order Number DE95006193. Source: OSTI; NTIS; INIS; GPO Dep.

Approximately 2100 metric tons of irradiated N Reactor fuel are stored in the KE and KW Basins at the Hanford Site, Richland, Washington. Corrosion of the fuel has led to the formation of sludges, both within the storage canisters and on the basin floors. Concern about the degraded condition of the fuel and the potential for leakage from the basins in proximity to the Columbia River has resulted in DOE's commitment in the Tri-Party Agreement (TPA) to Milestone M-34-00-T08 to remove the fuel and sludges by a December 2002 target date. To support the planning for this expedited removal action, the implications of sludge management under various scenarios are examined. Volume 1 of this two-volume report describes the regulatory options for managing the sludges, including schedule and cost impacts, and assesses strategies for establishing a preferred path.

7344 (PNL–10398-Vol.2) **K Basin spent fuel sludge treatment alternatives study. Volume 2, Technical options.** Beary, M.M. (Science Applications International Corp., Richland, WA (United States)); Honekemp, J.R.; Winters, N. Pacific Northwest Lab., Richland, WA (United States); Science Applications International Corp., Richland, WA (United States). Jan 1995. 158p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Agreement 188694-A-A2. Order Number DE95006194. Source: OSTI; NTIS; INIS; GPO Dep.

Approximately 2100 metric tons of irradiated N Reactor fuel are stored in the KE and KW Basins at the Hanford Site, Richland, Washington. Corrosion of the fuel has led to the formation of sludges, both within the storage canisters and on the basin floors. Concern about the degraded condition of the fuel and the potential for leakage from the basins in proximity to the Columbia River has resulted in DOE's commitment in the Tri-Party Agreement (TPA) to Milestone M-34-00-T08 to remove the fuel and sludges by a December 2002 target date. To support the planning for this expedited removal action, the implications of sludge management under various scenarios are examined. This report, Volume 2 of two volumes, describes the technical options for managing the sludges, including schedule and cost impacts, and assesses strategies for establishing a preferred path.

7345 (PNL-SA–21497) **Characterization of Hanford tank wastes containing ferrocyanides.** Tingey, J.M.; Matheson, J.D.; McKinley, S.G.; Jones, T.E.; Pool, K.H. Pacific Northwest Lab., Richland, WA (United States). Feb 1993. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940225–126: Waste management '94, Tucson, AZ (United States), 27 Feb - 3 mar 1994). Order Number DE95004561. Source: OSTI; NTIS; INIS; GPO Dep.

Currently, 17 storage tanks on the Hanford site that are believed to contain > 1,000 gram moles (465 lbs) of ferrocyanide compounds have been identified. Seven other tanks are classified as ferrocyanide containing waste tanks, but contain less than 1,000 gram moles of ferrocyanide compounds. These seven tanks are still included as Hanford Watch List Tanks. These tanks have been declared an unreviewed safety question (USQ) because of potential thermal reactivity hazards associated with the ferrocyanide compounds and nitrate and nitrite. Hanford tanks with waste containing > 1,000 gram moles of ferrocyanide have been sampled. Extensive chemical, radiothermical, and physical characterization have been performed on these waste samples. The reactivity of these wastes were also studied using Differential Scanning Calorimetry

(DSC) and Thermogravimetric analysis. Actual tank waste samples were retrieved from tank 241-C-112 using a specially designed and equipped core-sampling truck. Only a small portion of the data obtained from this characterization effort will be reported in this paper. This report will deal primarily with the cyanide and carbon analyses, thermal analyses, and limited physical property measurements.

7346 (PNL-SA–23718) **Comparative study of Total Organic Carbon (TOC) methods for high-level mixed waste.** Baldwin, D.L. (Pacific Northwest Lab., Richland, WA (United States)); Stromatt, R.W.; Winters, W.I. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940815–104: International nuclear and hazardous waste management conference, Atlanta, GA (United States), 14-18 Aug 1994). Order Number DE95004900. Source: OSTI; NTIS; INIS; GPO Dep.

Hanford tank waste is a complex, nonhomogeneous sludge, slurry, or salt-cake mixture requiring robust methods for analytical characterization. While numerous total organic carbon (TOC) methods are described in the literature, no single TOC method has been found to be ideal for this caustic, high-salt, sometime high-fluoride matrix. Three TOC methods have been in use at the Pacific Northwest Laboratory, and one complementary method is in place at Westinghouse Hanford Company. All have been found to have strengths and weaknesses when applied to the Hanford tank waste problem. These TOC methods include silver-catalyzed hot persulfate wet oxidation in batch-mode with coulometry detection, two methods for high-temperature furnace oxidation with coulometry detection, and UV-catalyzed persulfate oxidation with nondispersive infrared detection. To provide comparative data on these four methods, a recovery study of carbon compounds, which are relevant to Hanford tank waste, has been performed. One major conclusion is that it is most useful to have multiple methods available for the analysis of this waste material. The comparative study is discussed, operational experience in TOC analysis from these laboratories is described, and strengths and weaknesses in the methods are summarized.

7347 (PNL-SA–23723) **Salt splitting of sodium-dominated radioactive waste using ceramic membranes.** Hollenberg, G.W. (Pacific Northwest Lab., Richland, WA (United States)); Carlson, C.D.; Virkar, A.; Joshi, A. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940815–103: International nuclear and hazardous waste management conference, Atlanta, GA (United States), 14-18 Aug 1994). Order Number DE95004578. Source: OSTI; NTIS; INIS; GPO Dep.

The potential for salt splitting of sodium dominated radioactive wastes by use of a ceramic membrane is reviewed. The technical basis for considering this processing technology is derived from the technology developed for battery and chlor-alkali chemical industry. Specific comparisons are made with the commercial organic membranes which are the standard in nonradioactive salt splitting. Two features of ceramic membranes are expected to be especially attractive: high tolerance to gamma irradiation and high selectivity between sodium and other ions. The objective of the salt splitting process is to separate nonradioactive sodium from contaminated sodium salts prior to other pretreatment processes in order to: (1) concentrate the waste in order to reduce the volume of subsequent additives and capacity of equipment, (2) decrease the pH of the waste in preparation for further processing, and (3) provide sodium with very low radioactivity levels for caustic washing of sludge or low level and mixed waste vitrification.

7348 (PNL-SA–23952) **A chemical model for the major electrolyte components of the Hanford waste tanks. The binary electrolytes in the system: $Na-NO_3-NO_2-SO_4-CO_3-F-PO_4-OH-Al(OH)_4-H_2O$.** Felmy, A.R.; Rustad, J.R.; Mason, M.J.; Bretonne, R. de la. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9408168–3: American Chemical Society symposium on scientific issues related to safety treatment of waste tanks, Atlanta, GA (United States), 21-26 Aug 1994). Order Number DE95004957. Source: OSTI; NTIS; INIS; GPO Dep.

An aqueous thermodynamic model is developed, based on the equations of Pitzer, which accurately model the major binary electrolytes in the $Na-NO_3-NO_2-SO_4-CO_3-F-PO_4-OH-Al(OH)_4-H_2O$ chemical system. This model was developed both from existing data in the literature, and from new osmotic and solubility measurements made as part of this study. Some of the new experimental data developed as part of this study include measurements of osmotic coefficients for $NaNO_3$, $NaNO_2$, and Na_3PO_4 at both 50 and 100°C as well as selected measurements of NaF at 100°C. In addition, the solubility of gibbsite was measured in mixed $NaOH-NaNO_3$ solutions to determine the reliability of existing thermodynamic models of aluminum hydroxide solubility when applied to concentrated nitrate. In general the final model proposed here is valid from dilute solution to salt saturation over the temperature range 25-100°C. The accuracy of the model is tested by comparisons of the model predictions with experimental data in selected common-ion ternary systems. When necessary a few commonion ternary ion interaction parameters for the Pitzer model were developed.

7349 (PNL-SA–24027) **The solubility of $Cr(OH)_3(am)$ in concentrated NaOH and $NaOH-NaNO_3$ solutions.** Felmy, A.R.; Rai, D.; Fulton, R.W. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9408168–2: American Chemical Society symposium on scientific issues related to safety treatment of waste tanks, Atlanta, GA (United States), 21-26 Aug 1994). Order Number DE95004559. Source: OSTI; NTIS; INIS; GPO Dep.

Chromium is a major component of the Hanford waste tank sludges, and the presence of Cr in the sludges is a significant concern in the disposal of these sludges because Cr can interfere with the formation of waste glasses. One of the current pretreatment strategies for removing constituents that can interfere with glass formation, such as P and Cr, is to wash/dissolve the sludges in basic NaOH solutions. The solubility of $Cr(OH)_3(am)$ was measured in concentrated NaOH ranging in concentration from 0.1M to 6.0M and in $NaOH-NaNO_3$ solutions with fixed NaOH concentration and variable $NaNO_3$ concentration at room temperature (22–23 C). Equilibrium between solids and solutions was approached relatively slowly and required approximately 60–70 days before steady-state concentrations were reached. A thermodynamic model, based upon the Pitzer equations, was developed from the solubility data in NaOH, which includes only two aqueous Cr species ($Cr(OH)_4^-$ and $NaCr(OH)_4(aq)$) and ion-interaction parameters for Na^+ with $Cr(OH)_4^-$. This model was then tested in the mixed $NaOH-NaNO_3$ solutions and found to be reliable.

7350 (PNL-SA–24672) **Vitrification of high sulfate wastes.** Merrill, R.A.; Whittington, K.F.; Peters, R.D. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9409178–12: American Chemical Society meeting on industrial and engineering chemistry, Atlanta, GA (United States), 19-21 Sep 1994). Order Number DE95004560. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) through the Mixed Waste Integrated Program (MWIP) is investigating the application of vitrification technology to mixed wastes within the DOE system This work involves identifying waste streams, laboratory testing to identify glass formulations and characterize the vitrified product, and demonstration testing with the actual waste in a pilot-scale system. Part of this program is investigating process limits for various waste components, specifically those components that typically create problems for the application of vitrification, such as sulfate, chloride, and phosphate. This work describes results from vitrification testing for a high-sulfate waste, the 183-H Solar Evaporation Basin waste at Hanford. A low melting phosphate glass formulation has been developed for a waste stream high in sodium and sulfate. At melt temperatures in the range of 1,000 C to 1,200 C, sulfate in the waste is decomposed to gaseous oxides and driven off during melting, while the remainder of the oxides stay in the melt. Decomposition of the sulfates eliminates the processing problems typically

encountered in vitrification of sulfate-containing wastes, resulting in separation of the sulfate from the remainder of the waste and allowing the sulfate to be collected in the off-gas system and treated as a secondary waste stream. Both the vitreous product and intentionally devitrified samples are durable when compared to reference glasses by TCLP and DI water leach tests. Simple, short tests to evaluate the compatibility of the glasses with potential melter materials found minimal corrosion with most materials.

7351 (PNL-SA–24698) **Organic destruction to enhance the separation of strontium in radioactive wastes.** Schmidt, A.J.; Elmore, M.R.; Orth, R.J.; Jones, E.O.; Zacher, A.H.; Hart, T.R.; Neuenschwander, G.G.; Poshusta, J.C. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941016–2: Materials week '94, Rosemont, IL (United States), 3-7 Oct 1994). Order Number DE95004926. Source: OSTI; NTIS; INIS; GPO Dep.

A low-temperature (300 C to 375 C) hydrothermal organic destruction process is being evaluated to help facilitate the removal of complexed radioactive species from bulk liquid components in Hanford tank waste. The work focuses on hydrothermal processing to destroy organic compounds that contribute to waste safety issues and organic complexants that promote the solubility of radioactive constituents such as ^{90}Sr and ^{241}Am. For the studies discussed here, testing was conducted using a nonradioactive Hanford tank waste simulant. The relative destruction rates of a variety of organic compounds known to be present in Hanford tank waste were evaluated. In addition, the tendency for these organic compounds to complex strontium and the effect of hydrothermal treatment on strontium removal were investigated.

7352 (PNL-SA–24741) **Analysis of radioactive waste samples by ion chromatography-ICP/MS.** Farmer, O.T. III; Reeves, J.H.; Wyse, E.J.; Clemeston, C.J.; Barinaga, C.J.; Smith, M.R.; Koppenaal, D.W. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9410147–3: 35. ORNL/DOE analytical chemistry in energy technology conference, Gatlinburg, TN (United States), 6-8 Oct 1994). Order Number DE95004936. Source: OSTI; NTIS; INIS; GPO Dep.

A comprehensive ion chromatography (IC) with beta-counting (beta) and inductively coupled plasma mass spectrometry (ICP/MS) detection approach has been developed to separate and detect 20 radionuclides in a Hanford waste tank sample. The IC separation was performed using a multi-functional group (anion/cation) resin and eluents of oxalic acid, diglycolic acid, and hydrochloric acid. Shorter-lived radionuclides were detected by a solid-state beta scintillation counter on-line with the IC separation. Mass spectrometry detection using an efficient and robust plasma ionization source provides isotopic discernability for both stable isotopes and long-lived radioactive species. Effective separation of over 47 elements and 160 isotopes was obtained from a single-elution scheme lasting 70 min. Automated IC separations provide the potential for rapid isotopic and radionuclide analysis of complex radioactive waste, using minimal sample and reagent volumes and reducing personnel exposures.

7353 (PNL-SA–25050) **Parametric design using IGRIP.** Baker, C. (Pacific Northwest Lab., Richland, WA (United States). Applied Physics Center). Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9410231–2: 8. Deneb user group meeting, Detroit, MI (United States), 10-14 Oct 1994). Order Number DE95004937. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy's (DOE) Hanford site near Richland, Washington is being cleaned up after 50 years of nuclear materials production. One of the most serious problems at the site is the waste stored in single-shell underground storage tanks. There are 149 of these tanks containing the spent fuel residue remaining after the fuel is dissolved in acid and the desired materials (primarily plutonium and uranium) are separated out. The tanks are upright cylinders 75 ft. in diameter with domed tops. They are made of reinforced concrete, have steel liners, and each tank is buried under 7–12 ft. of overburden. The tanks are up to 40-ft. high, and have capacities of 500,000, 750,000, or 1,000,000 gallons of waste. As many as one-third of these tanks are known or suspected to leak. The waste form contained in the tanks varies in consistency from liquid supernatant to peanut-butter-like gels and sludges to hard salt cake (perhaps as hard as low-grade concrete). The current waste retrieval plan is to insert a large long-reach manipulator through a hole cut in the top of the tank, and use a variety of end-effectors to mobilize the waste and remove it from the tank. PNL has, with the assistance of Deneb robotics employees, developed a means of using the IGRIP code to perform parametric design of mechanical systems. This method requires no modifications to the IGRIP code, and all design data are stored in the IGRIP workcell. The method is presented in the context of development of a passive articulated mechanism that is used to deliver down-arm services to a gantry robot. The method is completely general, however, and could be used to design a fully articulated manipulator. Briefly, the method involves using IGCALC expressions to control manipulator joint angles, and IGCALC variables to allow user control of link lengths and offsets. This paper presents the method in detail, with examples drawn from PNL's experience with the gantry robot service-providing mechanism.

7354 (PSI-PROC–92-02, pp. 83-103) **Technical policy with radioactive wastes management.** Chuvilo, I.V. (Inst.for Theoretical and Experimental Physics, Moscow (Russian Federation)). No corporate text available. Sep 1992. 657p. (CONF-9109524–: Specialists' meeting on accelerator-based transmutation, Villigen (Switzerland), 9-12 Sep 1991). In *Proceedings of the specialists' meeting on accelerator-based transmutation.* Order Number DE94612272.

This work discusses in details the possibilities of handling radioactive wastes. Burying of radioactive wastes into geological formation or near surface storages has its own risks taking into account the long-time prognosis of ecological, geological, hydrological and constructing requirements. Other alternatives suggested are isolation of wastes in the space through rocket-system, self heating of the waste resulting in self-burying into the depth of earth rocks and nuclear transmutation of long-lived, high level wastes in accelerators or nuclear reactors. Transmutation of radioactive nuclei is discussed in detail here.

7355 (PSI-PROC–92-02, pp. 297-317) **Large-scale future nuclear power and the problem of RAW handling.** Orlov, V.V. (PDIPE-NIKIET, Moscow (Russian Federation)); Ganev, I.K.; Naumov, V.V.; Tochenij, L.V.; Lopatkin, A.V. No corporate text available. Sep 1992. 657p. (CONF-9109524–: Specialists' meeting on accelerator-based transmutation, Villigen (Switzerland), 9-12 Sep 1991). In *Proceedings of the specialists' meeting on accelerator-based transmutation.* Order Number DE94612272.

This work gives the advantages of nuclear power over non-nuclear power. It discusses in details the type of radioactive waste produced due to nuclear power generation. Radioactive wastes can be classified as long-lived and middle lived wastes. Waste of these categories comprise mostly of fission products, structural materials and residue actinides. Hazard of radioactive waste, particularly long-lived radioactive wastes can be reduced by transmutation, compacting waste for storage and by following the rules of waste disposal strictly.

7356 (SAND–95-8002) **Pollution prevention opportunity assessment for Building 922 solid office waste.** Phillips, N.M. (Sandia National Labs., Livermore, CA (United States). Environmental Protection Dept.). Sandia National Labs., Livermore, CA (United States). Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95006199. Source: OSTI; NTIS; INIS; GPO Dep.

Building 922 houses all of SNL/California's ES and H Departments: Health Protection, Environmental Protection, Safety, and Environmental Operations. It covers approximately 10,000 square feet and houses about 80 people. The office personnel generate nonhazardous solid office wastes in their daily activities. To determine the types and amounts of waste generated, a special PPOA sorting team sorted all of the trash collected from the building for a

period of one-week (including paper and aluminum cans in the recycling bins). The team sorted the trash into major categories: paper, plastic, metals, glass, wet garbage, rest room waste, and miscellaneous materials. They then sorted it into subcategories within each major category. Rest room waste was collected but not sorted. The waste in each category was weighed separately. The total amount of trash collected during the week was approximately 168.8 kg (371.4 lbs). The results of this PPOA indicate that SNL/California is minimizing most nonhazardous office waste and reductions planned for the near future will add significantly to the minimization efforts.

7357 (SAND–95-8007) **Pollution prevention opportunity assessment for the SNL/California waste management facilities.** Braye, S. (Sandia National Labs., Livermore, CA (United States). Environmental Protection Dept.); Phillips, N.M. Sandia National Labs., Livermore, CA (United States). Jan 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95006200. Source: OSTI; NTIS; INIS; GPO Dep.

SNL/California's waste management facilities, Bldgs. 961 and 962-2, generate a secondary stream of hazardous and radioactive waste. This waste stream is generated mainly during the processing and handling of hazardous, radioactive, and mixed wastes (primary waste stream), which are generated by the laboratories, and when cleaning up spills. The secondary waste stream begins with the removal of a generator's hazardous, radioactive, and mixed waste from specified collection areas. The waste stream ends when the containers of processed waste are loaded for shipment off-site. The total amount of secondary hazardous waste generated in the waste management facilities from January 1993 to July 1994 was 1,160.6 kg. The total amount of secondary radioactive waste generated during the same period was 1,528.8 kg (with an activity of 0.070 mCi). Mixed waste usually is not generated in the secondary waste stream. This pollution prevention opportunity assessment (PPOA) was conducted using the graded approach methodology developed by the Department of Energy (DOE) PPOA task group. The original method was modified to accommodate the needs of Sandia's site-specific processes. The options generated for potential hazardous waste minimization, cost savings, and environmental health and safety were the result of a waste minimization team effort. The results of the team efforts are summarized.

7358 (SKB-TR–94-04) **Final report of the AECL/SKB Cigar Lake analog study.** Cramer, J. (ed.) (Atomic Energy of Canada Ltd. Research, Pinawa, MB (Canada). Whiteshell Labs.); Smellie, J. (ed.). Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). May 1994. 402p. (AECL–10851; COG–93-147.). Order Number DE95613252. Source: OSTI; NTIS; INIS.

The Cigar Lake uranium deposit is located in northern Saskatchewan, Canada. The 1.3-billion-year-old deposit is located at a depth of about 450 m below surface in a water-saturated sandstone at the unconformity contact with the high-grade metamorphic rocks of the Canadian Shield. The Cigar Lake deposit has many features that parallel those being considered within the Canadian concept for disposal of nuclear fuel waste. The study of these natural structures and processes provides valuable insight toward the eventual design and site selection of a nuclear fuel waste repository. The main feature of this analog is the absence of any indication on the surface of the rich uranium ore 450 m below. This indicates that the combination of natural barriers has been effective in isolating the uranium ore from the surface environment. More specifically, the deposit provides analog information relevant to the stability of UO_2 fuel waste, the performance of clay-based barriers, radionuclide migration, colloid formation, radiolysis, fission-product geochemistry and general aspects of water-rock interaction. The main geochemical studies on this deposit focus on the evolution of groundwater compositions in the deposit and on their redox chemistry with respect to the uranium, iron and sulphide systems. Since 1984, through cooperation from the owners of the Cigar Lake deposit, analog studies have been conducted. AECL, with support from Ontario Hydro under the auspices of the CANDU Owners Group, initiated international participation in 1989 through collaboration with the Swedish Nuclear Fuel and Waste Management Company (SKB) and, more recently, with the Los Alamos National Laboratory (LANL).

7359 (SKB-TR–94-08) **The structure of conceptual models with application to the Aespoe HRL project.** Olsson, Olle (Conterra AB, Uppsala (Sweden)); Baeckblom, G.; Wikberg, P.; Gustafson, G.; Rhen, I.; Stanfors, R. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). May 1994. 23p. Order Number DE95613253. Source: OSTI; NTIS; INIS.

In performance assessment a sequence of models is used to describe the function of the geological barrier. This report proposes a general structure and terminology for description of these models. A model description consists of the following components: A conceptual model which defines the geometric framework in which the problem is solved, the dimensions of the modelled volume, descriptions of the processes included in the model, and the boundary conditions; Data which are introduced into the conceptual model, and a mathematical or numerical tool used to produce output data. Contradictory to common practice in geohydrologic modelling it is proposed that the term conceptual model is restricted to define in what way the model is constructed, and that this is separated from any specific application of the conceptual model. Hence, the conceptual model should not include any specific data. 5 refs, 2 figs, 4 tabs.

7360 (SKB-TR–94-11) **Aespoe Hard Rock Laboratory. Annual Report 1993.** Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jun 1994. 82p. Order Number DE95616117. Source: OSTI; NTIS; INIS.

The Aespoe Hard Rock Laboratory is being constructed in preparation for the deep geological repository of spent fuel in Sweden. This Annual Report 1993 for the Aespoe Hard Rock Laboratory contains an overview of the work conducted. Present work is focused on verification of pre-investigation methods and development of the detailed investigation methodology. Construction of the facility and investigation of the bedrock are carried out in parallel. As of December 1993, 2760 m of the tunnel had been excavated to a depth of 370 m below the surface. An important and integral part of the work is further refinement of conceptual and numerical models for groundwater flow and radionuclide migration. Detailed plans have been prepared for several experiments to be conducted after the end of the construction work. Eight organizations from seven countries are now participating in the work at the Aespoe Hard Rock Laboratory and are contributing in different ways to the results being achieved.

7361 (SKB-TR–94-14) **Performance of the SKB copper/steel canister.** Widen, H. (Kemakta Konsult AB, Stockholm (Sweden)); Sellin, P. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Sep 1994. 59p. Order Number DE95613254. Source: OSTI; NTIS; INIS.

The performance of the SKB copper/steel canister has been analyzed. The present knowledge of long-term function of the canister is summarized. Radionuclide release calculations for a reference failure scenario and the effect of some variations on release rates are shown. The Features, Events and Processes (FEPs) that are affecting the studied scenarios have been classified according to the 'Rock Engineering Systems' methodology as defined by SKB for the copper/steel canister. Radionuclide release rate is calculated for a reference failure scenario where a small hole in the weld of the outer copper overpack is assumed to exist at the time of deposition. The hole in the copper overpack is assumed to be of a constant size until the inner steel canister looses its mechanical integrity. The steel is assumed to maintain mechanical stability during 5000 years and after this time period the hole through the copper is assumed to be 0.1 m^2, which translate to insignificant transport resistance from the canister wall. The release rates for C-14, Sr-90, I-129, Cs-137, Pu-239 and Am-241 are calculated for the reference failure scenario and for a number of variations. The variations include glaciation, only few of the Zircaloy tubes damaged, different canister filling materials, variations in sorption properties of the bentonite clay and different life-time of the inner steel canister. The performance of the canister and near-field, concerning the release rates of the studied radionuclides, is as expected, comparable to the release rates obtained in SKB 91. 11 refs, figs, tabs.

7362 (SSI–94-07) **Radioactive waste in the Russian Federation.** Grundfelt, B. (Kemakta Konsult AB, Stockholm (Sweden)); Lindbom, B. Swedish Radiation Protection Inst., Stockholm (Sweden). 20 Aug 1994. 35p. (KEMAKTA-AR–94-06.). Order Number DE95613234. Source: OSTI; NTIS; INIS.

The present report has been produced by Kemakta Consultants Co. under contract from the Swedish Radiation Protection Institute (SSI). The purpose of the study is to give a broad overview of the situation in the Russian Federation with regard to the production and management of radioactive waste. The report also presents an outline of possible risks for environmental and societal consequences of the current waste management practices. The study is intended to be used as a basis for discussions regarding possible international cooperative efforts for improving the waste management system in Russia. The report is mainly based on publicly available literature. In addition, information has been obtained during a two-day visit to the Bochvar Institute and the Russian Atomic Power Ministry, MinAtom, in Moscow. Complementary information has been provided by MinAtom in response to a questionnaire that was sent to MinAtom subsequent to the visit to Moscow. Staff at the Russian embassy in Stockholm has assisted in the organisation of contacts as well as with various clarifications and translations. Some of the information in this report has not been officially confirmed by the Russian authorities. 17 refs, 4 figs, 7 tabs.

7363 (UCRL-CR–117355) **Mixed Waste Management Facility Preliminary Safety Analysis Report. Chapters 1 to 20.** Lawrence Livermore National Lab., CA (United States); Weston (Roy F.), Inc./Vectra Government Services, Inc. (United States). Sep 1994. 505p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95005973. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides information on waste management practices, occupational safety, and a site characterization of the Lawrence Livermore National Laboratory. A facility description, safety engineering analysis, mixed waste processing techniques, and auxiliary support systems are included.

7364 (UCRL-ID–117120) **Decision and systems analysis for underground storage tank waste retrieval systems and tank waste remediation system.** Bitz, D.A. (Independent Consultant, Kirkland, WA (United States)); Berry, D.L.; Jardine, L.J. Lawrence Livermore National Lab., CA (United States). Mar 1994. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95004196. Source: OSTI; NTIS; INIS; GPO Dep.

Hanford's underground tanks (USTs) pose one of the most challenging hazardous and radioactive waste problems for the Department of Energy (DOE). Numerous schemes have been proposed for removing the waste from the USTs, but the technology options for doing this are largely unproven. To help assess the options, an Independent Review Group (IRG) was established to conduct a broad review of retrieval systems and the tank waste remediation system. The IRG consisted of the authors of this report.

7365 (UCRL-ID–118009) **Field-based tests of geochemical modeling codes using New Zealand hydrothermal systems.** Bruton, C.J.; Glassley, W.E.; Bourcier, W.L. Lawrence Livermore National Lab., CA (United States). Jun 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95005658. Source: OSTI; NTIS; INIS; GPO Dep.

Hydrothermal systems in the Taupo Volcanic Zone, North Island, New Zealand are being used as field-based modeling exercises for the EQ3/6 geochemical modeling code package. Comparisons of the observed state and evolution of the hydrothermal systems with predictions of fluid-solid equilibria made using geochemical modeling codes will determine how the codes can be used to predict the chemical and mineralogical response of the environment to nuclear waste emplacement. Field-based exercises allow us to test the models on time scales unattainable in the laboratory. Preliminary predictions of mineral assemblages in equilibrium with fluids sampled from wells in the Wairakei and Kawerau geothermal field suggest that affinity-temperature diagrams must be used in conjunction with EQ6 to minimize the effect of uncertainties in thermodynamic and kinetic data on code predictions.

7366 (USGS-OFR–92-657) **Geohydrologic data collected from shallow neutron-access boreholes and resultant-preliminary geohydrologic evaluations, Yucca Mountain area, Nye County, Nevada.** Blout, D.O. (Raytheon Services Nevada, Las Vegas, NV (United States)); Hammermeister, D.P.; Loskot, C.L.; Chornack, M.P. Geological Survey, Denver, CO (United States). 1994. 147p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI08-92NV10874. Order Number DE95005995. Source: OSTI; NTIS; INIS; U.S. Geological Survey, Earth Science Information Center, Open-File Reports Section, Box 25286, MS 517, Denver Federal Center, Denver, CO 80225; GPO Dep.

In cooperation with the US Department of Energy, 74 neutron-access boreholes were drilled in and near the southwestern part of the Nevada Test Site, Nye County, Nevada. Drilling, coring, sample collection and handling, and lithologic and preliminary geohydrologic data are presented in this report. The boreholes were drilled in a combination of alluvium/colluvium, ash-flow tuff, ash-fall tuff, or bedded tuff to depths of 4.6 to 36.6 meters. Air was used as a drilling medium to minimize disturbance of the water content and water potential of drill cuttings, core, and formation rock. Drill cuttings were collected at approximately 0.6-meter intervals. Core was taken at selected intervals from the alluvium/colluvium using drive-coring methods and from tuff using rotary-coring methods. Nonwelded and bedded tuffs were continuously cored using rotary-coring methods. Gravimetric water-content and water-potential values of core generally were greater than those of corresponding drill cuttings. Gravimetric water-content, porosity, and water-potential values of samples generally decreased, and bulk density values increased, as the degree of welding increased. Grain-density values remained fairly constant with changes in the degree of welding. A high degree of spatial variability in water-content and water-potential profiles was noted in closely spaced boreholes that penetrate similar lithologic subunits and was also noted in adjacent boreholes located in different topographic positions. Variability within a thick lithologic unit usually was small. 18 refs., 21 figs., 17 tabs.

7367 (WHC-EP–0809) **Potential tank waste material anomalies located near the liquid observation wells: Model predicted responses of a neutron moisture detection system.** Finfrock, S.H.; Toffer, H.; Watson, W.T. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002106. Source: OSTI; NTIS; INIS; GPO Dep.

Extensive analyses have been completed to demonstrate that a neutron moisture probe can be used to recognize anomalies in materials and geometry surrounding the liquid observation wells (LOWs). Furthermore, techniques can be developed that will permit the interpretation of detector readings, perturbed by the presence of anomalies, as more accurate moisture concentrations. This analysis effort extends the usefulness of a neutron moisture probe system significantly, especially in the complicated geometries and material conditions that may be encountered in the waste tanks. Both static-source and pulsed-source neutron probes were considered in the analyses. Four different detector configurations were investigated: Thermal and epithermal neutron detectors located in both the near and far field.

7368 (WHC-EP–0829) **Estimation and characterization of decontamination and decommissioning solid waste expected from the Plutonium Finishing Plant.** Millar, J.S. (and others); Pottmeyer, J.A.; Stratton, T.J. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 236p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005056. Source: OSTI; NTIS; INIS; GPO Dep.

Purpose of the study was to estimate the amounts of equipment and other materials that are candidates for removal and subsequent processing in a solid waste facility when the Hanford Plutonium Finishing Plant is decontaminated and decommissioned. (Building structure and soil are not covered.) Results indicate that ~5,500 m^3 of solid waste is expected to result from the decontamination and decommissioning of the Pu Finishing Plant. The breakdown of the volumes and percentages of waste by category

is 1% dangerous solid waste, 71% low-level waste, 21% transuranic waste, 7% transuranic mixed waste.

7369 (WHC-EP–0832) **Chemistry of proposed calcination/dissolution processing of Hanford Site tank wastes.** Delegard, C.H. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005982. Source: OSTI; NTIS; INIS; GPO Dep.

Plans exist to separate radioactive waste stored in underground tanks at the US Department of Energy's Hanford Site in south central Washington State into low-level and high-level fractions, and to immobilize the separate fractions in high-integrity vitrified forms for long-term disposal. Calcination with water dissolution has been proposed as a possible treatment for achieving low/high-level separation. Chemistry development activities conducted since 1992 with simulated and genuine tank waste show that calcination/dissolution destroys organic carbon and converts nitrate and nitrite to hydroxide and benign offgases. The process also dissolves significant quantities of bulk chemicals (aluminum, chromium, and phosphate), allowing their redistribution from the high-level to the low-level fraction. Present studies of the chemistry of calcination/dissolution processing of genuine wastes, conducted in the period October 1993 to September 1994, show the importance of sodium fluoride phosphate double salt in controlling phosphate dissolution. Peptization of waste solids is of concern if extensive washing occurs. Strongly oxidizing conditions imposed by calcination reactions were found to convert transition metals to soluble anions in the order chromate > manganate > > ferrate. In analogy with manganese behavior, plutonium dissolution, presumably by oxidation to more soluble anionic species, also occurs by calcination/dissolution. Methods to remove plutonium from the product low-level solution stream must be developed.

7370 (WHC-EP–0839) **Summary of fiscal year 1994 near-infrared spectroscopy moisture sensing activities.** Reich, F.R.; Johnson, R.E.; Philipp, B.L.; Duncan, J.B.; Schutzenhofer, G.L. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005477. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the work to develop and deploy near-infrared (NIR) moisture sensing technology for application to the Hanford Site's high-level nuclear waste materials. This work is jointly supported by the U.S. Department of Energy's (DOE) EM-50 Office of Technology Development Support and the EM-30 Tank Waste Safety and Tank Waste Remediation Systems Programs. A basic NIR system was developed at the Savannah River Laboratory (SRL) with support from DOE's EM-50 Office. The application of this technology to Hanford's high-level wastes (HLW). Including deployment, is supported by DOE's EM-30 Systems Programs. The need to know the moisture content in HLW is driven by concerns for the safety of underground storage tanks that contain or are suspected of containing ferrocyanide and organic types of materials. The NIR technology has application for both ex situ (hot cell core measurements) and in situ waste tank moisture sensing. The cold test/calibration data in this report was generated as part of the total life cycle development path being followed in the development and deployment of the NIR technology at the Hanford Site.

7371 (WHC-SA–2407) **Global modeling of Hanford tank waste pretreatment alternatives within a total cleanup system using ASPEN PLUS™.** Knutson, B.J. (Westinghouse Hanford Co., Richland, WA (United States)); Jansen, G. Jr.; Zimmerman, B.D.; Niccoli, L.G.; Lauerhass, L. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-9411135–3: ASPENWORLD 94, Boston, MA (United States), 6-9 Nov 1994). Order Number DE95004488. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this work is to evaluate and compare radionuclide separations/processing technologies being developed or considered as Hanford tank waste pretreatment alternatives. These technologies are integrated into a total cleanup system that includes tank waste retrieval, treatment, and disposal. Current Hanford flowsheets typically include only mature, developed technologies, not new technologies. Thus, this work examines the impact/benefits of inserting new technologies into Hanford flowsheets. Waste treatment must produce disposal fractions which are less troublesome than the original material. Researchers seeking effective treatment methods may lack the tools or expertise to fully understand the implications of their approach in terms of secondary and tertiary waste streams or the extent to which a unique new process will affect upstream or downstream processes. This work has developed and demonstrated mass balance methods that clarify the effect of including individual processes in an integrated waste treatment system, such as the Hanford cleanup system. The methods provide a measure of treatment effectiveness and a format for the researcher to understand waste stream interrelationships and determine how a particular treatment technology can best be used in a cleanup system. A description of the Hanford tank waste cleanup model developed using the ASPEN PLUS flowsheet simulation tool is given. Important aspects of the modeling approach are discussed along with a description of how performance measures were developed and integrated within the simulation to evaluate and compare various Hanford tank waste pretreatment alternatives.

7372 (WHC-SA–2505) **Accelerated characterization of metal fuel stored in the Hanford K basins.** Makenas, B.J. (Westinghouse Hanford Co., Richland, WA (United States)); Omberg, R.P.; Lawrence, L.A.; Marschman, S.C.; Abrefah, J. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-941207–16: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95004362. Source: OSTI; NTIS; INIS; GPO Dep.

Efforts are under way to gather data on the condition of the metal fuel and associated sludge stored in the water-filled Hanford K Basins. Most of the current data gathering activities are being performed in the basins without fuel movement. These techniques include a video survey of open storage canisters, determination of water/gas levels in sealed canisters, sampling of gas and water from sealed canisters (for chemical analysis) and measurement of sludge depth and sludge volume.

7373 (WHC-SD-L225-ATP–001) **Acceptance test procedure for the MO-294 Building.** McKenna, P.J. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004786. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting document provides the Acceptance Test Procedure (ATP) for the acceptance and testing of the fire alarm system of mobile office MO-294.

7374 (WHC-SD-LEF-TS–001) **200 Area treated effluent disposal facility operational test specification.** Crane, A.F. Westinghouse Hanford Co., Richland, WA (United States). 12 Jan 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005462. Source: OSTI; NTIS; INIS; GPO Dep.

This document identifies the test specification and test requirements for the 200 Area Treated Effluent Disposal Facility (200 Area TEDF) operational testing activities. These operational testing activities, when completed, demonstrate the functional, operational and design requirements of the 200 Area TEDF have been met.

7375 (WHC-SD-NR-CSER–014-Rev.1) **Criticality safety evaluation report for the 100 KE Basin sandfilter backwash pit.** Erickson, D.G. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004753. Source: OSTI; NTIS; INIS; GPO Dep.

This analysis presents the technical basis for establishing a safe mass limit for continued operations of the KE Basin sandfilter backwash pit. The main analysis is based on a very conservative UO_2-PuO_2-H_2O system using the measured isotopic concentrations of uranium and plutonium in the sludge. Appendix C contains

analyses of the sandfilter backwash pit utilizing all verified materials presently in the pit, and gives new limits based on assumptions made.

7376 (WHC-SD-SNF-CSER–002) **Criticality safety evaluation report for K Basin filter cartridges.** Schwinkendorf, K.N. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004495. Source: OSTI; NTIS; INIS; GPO Dep.

A criticality safety evaluation of the K Basin filter cartridge assemblies has been completed to support operations without a criticality alarm system. The results show that for normal operation, the filter cartridge assembly is far below the safety limit of k_{eff} = 0.95, which is applied to plutonium systems at the Hanford Site. During normal operating conditions, uranium, plutonium, and fission and corrosion products in solution are continually accumulating in the available void spaces inside the filter cartridge medium. Currently, filter cartridge assemblies are scheduled to be replaced at six month intervals in KE Basin, and at one year intervals in KW Basin. According to available plutonium concentration data for KE Basin and data for the U/Pu ratio, it will take many times the six-month replacement time for sufficient fissionable material accumulation to take place to exceed the safety limit of k_{eff} = 0.95, especially given the conservative assumption that the presence of fission and corrosion products is ignored. Accumulation of sludge with a composition typical of that measured in the sand filter backwash pit will not lead to a k_{eff} = 0.95 value. For off-normal scenarios, it would require at least two unlikely, independent, and concurrent events to take place before the k_{eff} = 0.95 limit was exceeded. Contingencies considered include failure to replace the filter cartridge assemblies at the scheduled time resulting in additional buildup of fissionable material, the loss of geometry control from the filter cartridge assembly breaking apart and releasing the individual filter cartridges into an optimal configuration, and concentrations of plutonium at U/Pu ratios less than measured data for KE Basin, typically close to 400 according to extensive measurements in the sand filter backwash pit and plutonium production information.

7377 (WHC-SD-SNF-SARR–003) **Hydrogen production in the K-Basin ion exchange columns, modules and cartridge filters.** Westinghouse Hanford Co., Richland, WA (United States). 21 Dec 1994. 184p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005622. Source: OSTI; NTIS; INIS; GPO Dep.

K-Basin uses ion exchange modules and ion exchange (IX) columns for removing radionuclides from the basin water. When the columns and modules are loaded, they are removed from service, drained and stored. After a few IX columns accumulate in storage, they are moved to a burial box. One of the burial box contains 33 columns and the other, six. The radionuclides act on the liquid left within and adhering to the beads to produce hydrogen. This report describes the generation rate, accumulation rate and significance of that accumulation. This summary also highlights those major areas of concern to the external (to Westinghouse Hanford Company [WHC]) reviewers. Appendix H presents the comments made by the external reviewers and, on a separate sheet, the responses to those comments. The concerns regarding the details of the analytical approach, are addressed in Appendix H and in the appropriate section.

7378 (WHC-SD-SNF-SARR–004) **Results of falling barrier analyses.** Fox, G.L. Westinghouse Hanford Co., Richland, WA (United States). 31 Oct 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004494. Source: OSTI; NTIS; INIS; GPO Dep.

This document assesses the consequences if the isolation barrier plate is dropped and falls over on the fuel stored in the water-filled K-East basin. The water slows the rate of fall and some canister bending is expected but only a few rods, if any, would get crushed. The basin criticality calculations will not be affected.

7379 (WHC-SD-TD-CR–001) **Design criteria for the light duty utility arm system end effectors.** Pardini, A.F. Westinghouse Hanford Co., Richland, WA (United States). 3 Jan 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005464. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the criteria for the design of end effectors that will be used as part of the Light Duty Utility Arm (LDUA) System. The LDUA System consists of a deployment vehicle, a vertical positioning mast, a light duty multi-axis robotic arm, a tank riser interface and confinement, a tool interface plate, a control system, and an operations control trailer. The criteria specified in this document will apply to all end effector systems being developed for use on or with the LDUA system at the Hanford site. The requirement stipulated in this document are mandatory.

7380 (WHC-SD-TD-ICD–001) **Light Duty Utility Arm interface control document plan.** Engstrom, J.W. Westinghouse Hanford Co., Richland, WA (United States). 27 Dec 1994. 89p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005068. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the interface control documents that will be used to identify and control interface features throughout all phases of the Light Duty Utility Arm (LDUA) development and design. After the system is built, delivered and installed in the Cold Test Facility and later at the tank farm, the Interface Control Documents can be used in maintaining the configuration control process. The Interface Control Document will consist of Interface Control Drawings and a data base directly tied to the Interface Control Drawings. The data base can be used as an index to conveniently find interface information. Design drawings and other text documents that contain interface information will appear in the database. The Interface Control Drawings will be used to document and control the data and information that define the interface boundaries between systems, subsystems and equipment. Also, the interface boundaries will define the areas of responsibility for systems and subsystems. The drawing will delineate and identify all the physical and functional interfaces that required coordination to establish and maintain compatibility between the co-functioning equipment, computer software, and the tank farm facilities. An appendix contains the Engineering interface control database system riser manual.

7381 (WHC-SD-W007H-ATR–001) **BCP selector valves and limit switches.** Rippy, G.L. Westinghouse Hanford Co., Richland, WA (United States). 9 Jan 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005650. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure (ATP) has been prepared to demonstrate that the Electrical/Instrumentation systems for the BCP stream function as required by project criteria. Specifically, the test will verify the operation of the solenoid valves and associated limit switches installed for the BCP portion of W-OO7H. This equipment is part of the B-Plant Process Condensate Treatment Facility.

7382 (WHC-SD-W025-VI–001) **Leachate storage transport tanker loadout piping.** Whitlock, R.W. Westinghouse Hanford Co., Richland, WA (United States). 5 Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002083. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains schematic drawings for the pipe fittings for the Hanford waste tanks. Included are the modifications to the W-025 trench #31 leachate loadout piping, and also the modifications to the tanker trailers. The piping was modified to prevent spillage to the environment. The tankers were modified for loading and unloading purposes.

7383 (WHC-SD-W049H-ICD–001-Rev.1) **200 Area TEDF interface control document.** Brown, M.J.; Hildebrand, R.A. Westinghouse Hanford Co., Richland, WA (United States). 15 Nov 1994. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004472. Source: OSTI; NTIS; INIS; GPO Dep.

Because the TEDF does not have any treatment or retention capacity, strict control at the generator interface is essential to operate the TEDF in compliance with good engineering practices, Hanford site requirements, and the 216 Discharge Permit. The information in the Interface Control Document (ICD) forms the basis of understanding between all parties involved in the TEDF; DOE,

WHC, and the generating facilities. The ICD defines the controlling document hierarchy; LEF, and generator responsibilities; monitoring and sampling requirements; and specifies the TEDF/Generator Interface points.

7384 (WHC-SD-W100-AP–002) **183-H basin sludge treatability testing program plan.** Burbank, D.A. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002113. Source: OSTI; NTIS; INIS; GPO Dep.

This document outlines the scope, data objectives, plan of action, responsibilities, cost and schedule of a program to perform hot treatability testing on 183-H basin sludge samples. This plan is the top-level planning document for this activity.

7385 (WHC-SD-W151-ANAL–001) **Structural evaluation of thermocouple probes for 241-AZ-101 waste tank.** Kanjilal, S.K. Westinghouse Hanford Co., Richland, WA (United States). 6 Dec 1994. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004749. Source: OSTI; NTIS; INIS; GPO Dep.

This document reports on the structural analysis of the thermocouple probe to be installed in 241-AZ-101 waste tank. The thermocouple probe is analyzed for normal pump mixing operation and potential earthquake induced loads required by the Hanford Site Design Criteria SDC-4.1.

7386 (WHC-SD-W236A-ER–008) **Engineering scale mixing system tests for MWTF title II design.** Chang, S.C. Westinghouse Hanford Co., Richland, WA (United States). 10 Oct 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002144. Source: OSTI; NTIS; INIS; GPO Dep.

Mixing tests for the Multifunction Waste Tank Facility (MWTF) were conducted in 1/25 and 1/10 scale test tanks with different slurry levels, solids concentrations, different jet mixers and with simulated in-tank structures. The same test procedure was used as in the Title I program, documented in WHC-SD-W236A-ER-005. The test results support the scaling correlation derived previously in the Title I program. The tests also concluded that a partially filled tank requires less mixing power, and horizontal and angled jets in combination (H/A mixer) are significantly more effective than the two horizontal jet mixers (H/H mixer) when used for mixing slurry with a high solids concentrations.

7387 (WHC-SD-W314B-DA–002) **Tank vapor mitigation requirements for Hanford Tank Farms.** Rakestraw, L.D. Westinghouse Hanford Co., Richland, WA (United States). 15 Nov 1994. 634p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004424. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Hanford Company has contracted Los Alamos Technical Associates to listing of vapors and aerosols that are or may be emitted from the High Level Waste (HLW) tanks at Hanford. Mitigation requirements under Federal and State law, as well as DOE Orders, are included in the listing. The lists will be used to support permitting activities relative to tank farm ventilation system up-grades. This task is designated Task 108 under MJB-SWV-312057 and is an extension of efforts begun under Task 53 of Purchase Order MPB-SVV-03291 5 for Mechanical Engineering Support. The results of that task, which covered only thirty-nine tanks, are repeated here to provide a single source document for vapor mitigation requirements for all 177 HLW tanks.

7388 (WHC-SD-W320-QAPP–001-Rev.1) **Project Specific Quality Assurance Plan (QAPP).** Huston, J.J. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004474. Source: OSTI; NTIS; INIS; GPO Dep.

The Project QAPP's describe the program and the planned actions which WHC will implement to demonstrate and ensure that the project meets the requirements of DOE Order 5700.6C. The Project involves retrieving the high-heat waste from Tank 241-C-106 to close the safety issue associate with the tank, demonstrate initial waste retrieval technology for a Single Shell Tank, and provide feed for the Hanford Waste Vitrification Plant.

7389 (WHC-SD-W340-ES–002) **Project W-340 long reach arm retrieval system balance of plant instrumentation workshop engineering study.** Schneider, T.C. Westinghouse Hanford Co., Richland, WA (United States). Jan 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004785. Source: OSTI; NTIS; INIS; GPO Dep.

This engineering study documents the results of a workshop held to resolve Issue No. 26 generated at a Arm Based Retrieval Functional Analysis Value Engineering Session. The issue deals with the scope of the Balance of Plant Instrumentation needs for the LRARS.

7390 (WHC-SD-W378-SP–001) **Low-Level Waste Vitrification Plant Project contracting strategy decision analysis report.** Felise, P.; Phillips, J.D. Westinghouse Hanford Co., Richland, WA (United States). 17 Oct 1994. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002155. Source: OSTI; NTIS; INIS; GPO Dep.

Ten basic contracting strategies were developed after a review of past strategies that had been used at the Hanford Site, other US Department of Energy (DOE) sites, other US government agencies, and in the private sector. As applicable to the Low-Level Waste Vitrification Plant (LLWVP) Project, each strategy was described and depicted in a schedule format to assess compatibility with the Hanford Federal Facility Agreement and Consent Order, al so known as the Tri-Party Agreement (Ecology et al. 1994) milestones, key decision points, and other project requirements. The-pro and con aspects of each strategy also were tabulated. Using this information as a basis, the LLWVP Project team members, along with representatives of Tank Waste Remediation System (TWRS) Engineering, TWRS Programs, and Procurement Materials Management, formed a Westinghouse Hanford Company (WHC) evaluation team to select the best strategy. Kepner-Tregoe decision analysis techniques were used in facilitated meetings to arrive at the best balanced choice.

7391 (WHC-SD-WM-ANAL–040) **242-A Evaporator ion exchange column (IX-D-1) tie down evaluation.** Hundal, T.S. Westinghouse Hanford Co., Richland, WA (United States). 23 Jan 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005991. Source: OSTI; NTIS; INIS; GPO Dep.

The existing ion exchange column in the 242-A evaporator building is not anchored to the floor slab. This equipment is a Safety Class 3 sitting in a Safety Class 2 building. The column needed to be evaluated to withstand the seismic loads. Anchor bolts have been designed to hold the column during the seismic event.

7392 (WHC-SD-WM-ATP–093) **Acceptance test procedure, 241-SY-101 Flexible Receiver System, Phase III testing.** Ritter, G.A. Westinghouse Hanford Co., Richland, WA (United States). 21 Nov 1994. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004510. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure is for the 241-SY-101 Flexible Receiver System, Phase III Testing. This procedure will test the sealing integrity of the Flexible Receiver System to ensure that release of waste and aerosols will be minimized during the removal of the test mixer pump from tank SY-101.

7393 (WHC-SD-WM-ATP–113) **Inspection system performance test procedure.** Jensen, C.E. Westinghouse Hanford Co., Richland, WA (United States). 17 Jan 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005989. Source: OSTI; NTIS; INIS; GPO Dep.

This procedure establishes requirements to administer a performance demonstration test. The test is to demonstrate that the double-shell tank inspection system (DSTIS) supplied by the contractor performs in accordance with the WHC-S-4108, Double-Shell Tank Ultrasonic Inspection Performance Specification, Rev. 2-A, January, 1995. The inspection system is intended to provide

ultrasonic (UT) and visual data to determine integrity of the Westinghouse Hanford Company (WHC) site underground waste tanks. The robotic inspection system consists of the following major subsystems (modules) and components: Mobile control center; Deployment module; Cable management assembly; Robot mechanism; Ultrasonic testing system; Visual testing system; Pneumatic system; Electrical system; and Control system.

7394 (WHC-SD-WM-ATR–082) **DACS upgrade acceptance test report.** Zuehlke, A.C. Westinghouse Hanford Co., Richland, WA (United States). 21 Dec 1994. 229p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005293. Source: OSTI; NTIS; INIS; GPO Dep.

The DACS, which is housed in a trailer located just outside of the north fence at the SY tank farm, receives input signals from a variety of sensors located in and around the SY-101 tank. These sensors provide information such as: (1) tank vapor space and ventilation system H_2 concentration; (2) tank waste temperature; (3) tank pressure; (4) waste density; (5) operating pump parameters such as speed, flow, rotational position, discharge pressure, and internal temperature; (6) strain (for major equipment); and (7) waste level. The output of these sensors is conditioned and transmitted to the DACS computers where these signals are displayed, recorded, and monitored for out-of-specification conditions. If abnormal conditions are detected, then, in certain situations, the DACS automatically generates alarms and causes the system to abort pump operations. The report documents testing performed per WHC-SD-WM-ATP-082. Rev. 0-13.

7395 (WHC-SD-WM-DA–144) **Wind and seismic analysis for liquid-level gauge support.** Ziada, A.H. Westinghouse Hanford Co., Richland, WA (United States). 7 Dec 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004752. Source: OSTI; NTIS; INIS; GPO Dep.

A wind and seismic analysis was performed for the liquid-level gauge installation support stand. The analysis includes the stand and footing only. All of these supports are classified as safety class 3. The analysis was based on safety class 2 requirements for conservatism. Conventional hand calculations were performed to evaluate the stresses and overturning of the structure. The results and recommendations appear in Section 2.0. The configuration and loadings are discussed in Section 3.0; the analysis and evaluation appears in Section 4.0; and the detailed analysis is documented in Appendix A.

7396 (WHC-SD-WM-DA–159) **National standard and code compliance for electrical equipment installed in hazardous locations for the void fraction instrument.** Bussell, J.H.; Martin, J.D.; Stokes, T.I. Westinghouse Hanford Co., Richland, WA (United States). 26 Sep 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002158. Source: OSTI; NTIS; INIS; GPO Dep.

The hazardous area classification is evaluated and defined for the void fraction instrument (VFI). The void fraction instrument is an instrument that is used to measure gas bubble concentration in tank waste. It is a 18.3 meter (60-foot) long pipe with swivel sampling head. The assembly is lowered into tank waste via an available riser and waste sample is obtained. The sample is obtained and the sample chamber is pressurized from a fixed volume chamber. The pressure is then measured and then the VFI is moved to the next sample elevation.

7397 (WHC-SD-WM-DP–073) **Tank 241-SY-103 auger samples, risers 7A, 14B and 22A.** Bell, K.E. Westinghouse Hanford Co., Richland, WA (United States). 12 Dec 1994. 208p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005988. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary differential scanning calorimetry (DSC) and thermal gravimetric analysis (TGA) data were reported in a letter from K.L. Kocher, WHC, to G.D. Johnson; et. al, WHC, "40 Day Deliverable for Tank 241-SY-103", dated July 14, 1994. This report is the final report for the Sy-1-3 auger sample characterization effort; some of the data reported earlier may have changed. A copy of the hot cell work plan, chain of custody forms, extruded segment description sheets, and photographs of the extruded augers were also included in the cited letter. The final DSC, TGA, total organic carbon (TOC), and total inorganic carbon (TIC) data, and the DSC and TGA scans and analytical cards, are reported here.

7398 (WHC-SD-WM-DP–075) **Single Shell Tank Waste Characterization Project for Tank B-110, Core 9 - data package and PNL validation summary report.** Pool, K.N.; Jones, T.E.; McKinley, S.G.; Tingey, J.M.; Longaker, T.M.; Gibson, J.A. Westinghouse Hanford Co., Richland, WA (United States). 5 Dec 1990. 1506p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005283. Source: OSTI; NTIS; INIS; GPO Dep.

This Data Package contains results obtained by Pacific Northwest Laboratory (PNL) staff in the characterization and analyses of Core 9 segments taken from the Single-Shell Tank (SST) 110B. The characterization and analysis of Core 9 segments are outlined in the Waste Characterization Plan for Hanford Site Single-Shell Tanks and in the Pacific Northwest Laboratory (PNL) Single-Shell Tank Waste Characterization Support FY 89/90 Statement of Work (SOW), Rev. 1 dated March, 1990. Specific analyses for each subsample taken from a segment are delineated in Test Instructions prepared by the PNL Single-Shell Tank Waste Characterization Project Management Office (SST Project) in accordance with procedures contained in the SST Waste Characterization Procedure Compendium (PNL-MA-599). Analytical procedures used in the characterization activities are also included in PNL-MA-599. Core 9 included five segments although segment 1 did not have sufficient material for characterization. The five samplers were received from Westinghouse Hanford Company (WHC) on 11/21-22/89. Each segment was contained in a sampler and was enclosed in a shipping cask. The shipping cask was butted up to the 325-A hot cell and the sampler moved into the hot cell. The material in the sampler (i.e., the segment) was extruded from the sampler, limited physical characteristics assessed, and photographed. At this point samples were taken for particle size and volatile organic analyses. Each segment was then homogenized. Sub-samples were taken for required analyses as delineated in the appropriate Test Instruction. Table 1 includes sample numbers assigned to Core 9 segment materials being transferred from 325-A Hot Cell. Sample numbers 90-0298, 90-0299, 90-0302, and 90-0303 were included in Table 1 although no analyses were requested for these samples. Table 2 lists Core 9 sub-sample numbers per sample preparation method.

7399 (WHC-SD-WM-ER–332) **Evaporation analysis for Tank SX-104.** Barrington, C.A. Westinghouse Hanford Co., Richland, WA (United States). Oct 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004503. Source: OSTI; NTIS; INIS; GPO Dep.

Decreases in historical interstitial liquid level measurements in tank SX-104 were compared to predictions of a numerical model based upon diffusion of water through a porous crust. The analysis showed that observed level decreases could be explained by evaporation.

7400 (WHC-SD-WM-ER–349) **Historical Tank Content Estimate for the Northwest Quandrant of the Hanford 200 East Area.** Brevick, C.H.; Gaddis, L.A.; Pickett, W.W. Westinghouse Hanford Co., Richland, WA (United States). Jun 1994. 451p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004789. Source: OSTI; NTIS; INIS; GPO Dep.

Historical Tank Content Estimate of the Northeast Quadrant provides historical evaluations on a tank by tank basis of the radioactive mixed wastes stored in the underground single-shell tanks of the Hanford 200 East area. This report summaries historical information such as waste history, temperature, tank integrity, inventory estimates and tank level history on a tank by tank basis. Tank Farm aerial photos and in-tank photos of each tank are provided. A brief description of instrumentation methods used for waste tank surveillance, along with the components of the data management effort, such as waste status and Transaction Record Summary, Tank Layering Model, Defined Waste Types, and Inventory Estimates to generate these tank content estimates are also given in this report.

7401 (WHC-SD-WM-ER–352) **Historical Tank Content Estimate for the Southwest Quandrant of the Hanford 200 West Area.** Brevick, C.H.; Gaddis, L.A.; Pickett, W.W. Westinghouse Hanford Co., Richland, WA (United States). Jun 1994. 319p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004790. Source: OSTI; NTIS; INIS; GPO Dep.

Historical Tank Content Estimate of the Southwest Quadrant provides historical evaluations on a tank by tank basis of the radioactive mixed wastes stored in the underground single-shell tanks of the Hanford 200 West Area. This report summaries historical information such as waste history, temperature, tank integrity, inventory estimates and tank level history on a tank by tank basis. Tank farm aerial photos and in-tank photos of each tank are provided. A brief description of instrumentation and methods used for tank waste surveillance, along with the components of the data management effort, such as waste status and Transaction Record Summary, Tank Layering Model, Defined Waste Types, and Inventory Estimates to generate these tank content estimates are also given in this report.

7402 (WHC-SD-WM-ES–316) **Storage options for Long Length Contaminated Equipment (LLCE) items.** Hodgson, R.D. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005430. Source: OSTI; NTIS; INIS; GPO Dep.

A review of the Washington state requirements for the storage of long equipment items removed from tanks indicate that if the contaminated materials on the long equipment items are analyzed and determined to be DW, and not EHW, the containers can be stored on an uncovered, RCRA approved, storage pad. Long equipment items contaminated with reportable levels of EHW, or suspected of being contaminated with EHW, must be protected from the elements by means of a building or other protective covering that otherwise allows adequate inspection of the containers. Storage of the long equipment item containers on an uncovered storage pad is recommended and will reduce construction costs for new storage by an estimated 60 percent when compared to construction costs for enclosed storage.

7403 (WHC-SD-WM-FDC–032) **Tank SY-101 void fraction instrument functional design criteria.** McWethy, L.M. Westinghouse Hanford Co., Richland, WA (United States). 18 Oct 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002159. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the functional design criteria for design, analysis, fabrication, testing, and installation of a void fraction instrument for Tank SY-101. This instrument will measure the void fraction in the waste in Tank SY-101 at various elevations.

7404 (WHC-SD-WM-OTP–167) **Caustic addition system operability test procedure.** Parazin, R.E. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004501. Source: OSTI; NTIS; INIS; GPO Dep.

This test procedure provides instructions for performing operational testing of the major components of the 241-AN-107 Caustic Addition System by WHC and Kaiser personnel at the Rotating Equipment Shop run-in pit (Bldg. 272E).

7405 (WHC-SD-WM-OTP–168) **Operability test procedure [Tank] 241-SY-101 equipment removal system.** Mast, J.C. Westinghouse Hanford Co., Richland, WA (United States). 8 Dec 1994. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004751. Source: OSTI; NTIS; INIS; GPO Dep.

The 241-SY-101 equipment removal system (ERS) consists of components, equipment, instrumentation and procedures that will provide the means to disconnect, retrieve, contain, load and transport the Mitigation Pump Assembly (MPA) from waste Tank 241-SY-101 to the Central Waste Complex (CWC). The Operability Test Procedure (OTP) will test the interfaces between ERS components and will rehearse the procedure for MPA removal and transportation to the extent they can be mocked-up at the CTF (Cold Test Facility). At the conclusion of the OTP, the ERS components and equipment will be removed from the CTF, entered into the Component Based Recall System (CBRS), and stored until needed for actual MPA removal and transportation.

7406 (WHC-SD-WM-OTP–171) **Operability test procedure for the TK-900 effluent monitoring station.** Weissenfels, R.D. Westinghouse Hanford Co., Richland, WA (United States). 21 Dec 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005627. Source: OSTI; NTIS; INIS; GPO Dep.

This procedure will verify that the 221-B liquid effluent monitoring system, installed near the east end of the 6-in. chemical sewer header, functions as intended by design. TK-900B was installed near stairwell 3 in the 221-B electrical gallery by Project W-007H. The system is part of BAT/AKART for the BCE liquid effluent system.

7407 (WHC-SD-WM-SARR–012-Rev.1) **Accelerated safety analyses - structural analyses Phase I - structural sensitivity evaluation of single- and double-shell waste storage tanks.** Becker, D.L. Westinghouse Hanford Co., Richland, WA (United States). Nov 1994. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004755. Source: OSTI; NTIS; INIS; GPO Dep.

Accelerated Safety Analyses - Phase I (ASA-Phase I) have been conducted to assess the appropriateness of existing tank farm operational controls and/or limits as now stipulated in the Operational Safety Requirements (OSRs) and Operating Specification Documents, and to establish a technical basis for the waste tank operating safety envelope. Structural sensitivity analyses were performed to assess the response of the different waste tank configurations to variations in loading conditions, uncertainties in loading parameters, and uncertainties in material characteristics. Extensive documentation of the sensitivity analyses conducted and results obtained are provided in the detailed ASA-Phase I report, Structural Sensitivity Evaluation of Single- and Double-Shell Waste Tanks for Accelerated Safety Analysis - Phase I. This document provides a summary of the accelerated safety analyses sensitivity evaluations and the resulting findings.

7408 (WHC-SD-WM-SDR–008) **Purex canyon exhaust fan bearing temperature monitoring system doric 245 datalogger programming.** Blackaby, W.B. Westinghouse Hanford Co., Richland, WA (United States). 6 Sep 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005469. Source: OSTI; NTIS; INIS; GPO Dep.

A micro-processor based datalogger is used to monitor, display, and log seventeen RTD temperature channels. Five bearings are monitored for each of the three electric motor-fan assemblies and two bearings are monitored on the steam turbine unit. Several alarms per data channel (a High alarm at 236 degrees and a High High alarm at 246 degrees F) will alert the operation's staff to increasing abnormal bearing temperatures. This procedure is cross-referenced to the manufacturers manual. All programming steps will have the following footnote: Mpg x-xx. The Mpg refers to the Manual page, with x as the section number and xx as the page number in that section. When more information is needed, such as pictures or details, then the manual section and page number is provided.

7409 (WHC-SD-WM-SOIL–001) **Soil weight (lbf/ft^3) at Hanford waste storage locations (2 volumes).** Pianka, E.W. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 632p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005299. Source: OSTI; NTIS; INIS; GPO Dep.

Hanford Reservation waste storage tanks are fabricated in accordance with approved construction specifications. After an underground tank has been constructed in the excavation prepared for it, soil is place around the tank and compacted by an approved compaction procedure. To ensure compliance with the construction specifications, measurements of the soil compaction are taken by QA inspectors using test methods based on American Society for the Testing and Materials (ASTM) standards. Soil compaction tests

data taken for the 241AP, 241AN, and 241AW tank farms constructed between 1978 and 1986 are included. The individual data values have been numerically processed to obtain average soil density values for each of these tank farms.

7410 (WHC-SD-WM-TA–154) **Strategy for sampling Hanford Site tank wastes for development of disposal technology.** Kupfer, M.J. Westinghouse Hanford Co., Richland, WA (United States). 29 Dec 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005052. Source: OSTI; NTIS; INIS; GPO Dep.

This document explains the tank waste sampling strategy needed to obtain the information required to identify and develop pretreatment and waste immobilization processes. The key tenet of the strategy is that process testing with real waste material from the Hanford Site underground tanks is necessary to design processes and measure their effectiveness. This document provides the criteria for selection of the limited number of tanks to be sampled. A phased, iterative approach is used for the single-shell tank (SST) waste sampling. In the first sampling phase, samples are taken from 25 tanks which provide a good representation of the waste types of interest. Results from process testing of these samples will be considered in final selection of a limited number of additional SSTs to sample (currently expected to be an additional 14 tanks).

7411 (WHC-SD-WM-TA–156) **Tank Waste Remediation System tank waste pretreatment and vitrification process development testing requirements assessment.** Howden, G.F. Westinghouse Hanford Co., Richland, WA (United States). 24 Oct 1994. 210p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004747. Source: OSTI; NTIS; INIS; GPO Dep.

A multi-faceted study was initiated in November 1993 to provide assurance that needed testing capabilities, facilities, and support infrastructure (sampling systems, casks, transportation systems, permits, etc.) would be available when needed for process and equipment development to support pretreatment and vitrification facility design and construction schedules. This first major report provides a snapshot of the known testing needs for pretreatment, low-level waste (LLW) and high-level waste (HLW) vitrification, and documents the results of a series of preliminary studies and workshops to define the issues needing resolution by cold or hot testing. Identified in this report are more than 140 Hanford Site tank waste pretreatment and LLW/HLW vitrification technology issues that can only be resolved by testing. The report also broadly characterizes the level of testing needed to resolve each issue. A second report will provide a strategy(ies) for ensuring timely test capability. Later reports will assess the capabilities of existing facilities to support needed testing and will recommend siting of the tests together with needed facility and infrastructure upgrades or additions.

7412 (WHC-SD-WM-TI–386) **Evaluation of AY/AZ tank farm ventilation system during aging waste retrieval operations.** Wong, J.J.; Waters, E.D. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005077. Source: OSTI; NTIS; INIS; GPO Dep.

Waste Management is currently planning to demonstrate mobilization of radioactive waste sludges in Tank 101-AZ beginning in October 1991. The retrieval system being designed will utilize mixer pumps that generate high-velocity, high-volume submerged liquid jets to mobilize settled solids. There is concern that these jets may also generate radioactive aerosols, some of which may be carried into the tank Ventilation system. The purpose of this study is to determine if the current AY/AZ ventilation system or the proposed ventilation system upgrade (Project W-030) will provide adequate deentrainment of liquid and solid aerosols during mixer pump operations, or if the radioactive aerosols will overload the HEPA filters.

7413 (WHC-SD-WM-TI–608-Rev.1) **Hanford analytical sample projections FY 1995–FY 2000. Revision 1.** Simmons, F.M. Westinghouse Hanford Co., Richland, WA (United States). 2 Dec 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004490. Source: OSTI; NTIS; INIS; GPO Dep.

Sample projections have been categorized into 7 major areas: Environmental Restoration, Tank Waste Remediation, Solid Waste, Liquid Effluents, Site Monitoring, Industrial Hygiene, and General Process Support Programs. The estimates are through the Fiscal Year 2000 and are categorized by radiation level. The yearly sample projection for each program will be categorized as follows: Category 1: Non-Radioactive; Category 2: <1 mR/hr β/γ; <10 nCi/g α; Category 3: 1 mR/hr β/γ to <10 mR/hr β/γ; and <10 nCi/g α; Category 4: <10 mR/hr β/γ; and <200 nCi/g α; Category 5: 10 mR/hr β/γ to <100 mR/hr β/γ; and <200 nCi/g α; Category 6: >100 mR/hr β/γ; and Category 7: >200 nCi/g α.

7414 (WHC-SD-WM-TI–666) **Sample Exchange Evaluation (SEE) Report - Phase II.** Winters, W.I. Westinghouse Hanford Co., Richland, WA (United States). 28 Sep 1994. 154p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004502. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes the results from Phase II of the Sample Exchange Evaluation (SEE) Program, a joint effort to compare analytical laboratory performance on samples from the Hanford Site's high-level waste tanks. In Phase II, the program has been expanded to include inorganic constituents in addition to radionuclides. Results from Phase II that exceeded 20% relative percent difference criteria are identified.

7415 (WHC-SD-WM-TP–163) **Liquid Effluent Monitoring Information System (LEMIS) test plans release 1.0.** Adams, R.T. Westinghouse Hanford Co., Richland, WA (United States). 12 Oct 1994. 540p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002111. Source: OSTI; NTIS; INIS; GPO Dep.

The Liquid Effluent Monitoring Information System (LEMIS) is being developed as the organized information repository facility in support of the liquid effluent monitoring requirements of the Tri-Party Agreement. It is necessary to provide an automated repository into which the results from liquid effluent sampling will be placed. This repository must provide for effective retention, review, and retrieval of selected sample data by authorized persons and organizations. This System Architecture document is the aggregation of the DMR P+ methodology project management deliverables. Together they represent a description of the project and its plan through four Releases, corresponding to the definition and prioritization of requirements defined by the user.

7416 (WHC-SD-WM-TP–180) **Grout gas generation test plan.** Person, J.C. Westinghouse Hanford Co., Richland, WA (United States). 4 Jan 1995. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005623. Source: OSTI; NTIS; INIS; GPO Dep.

Disclosed are detailed procedures for measuring the rate of gas generation by grout made from synthetic tanks wastes or actual tank material. Objective is to measure the rate of gas generation for various gases (H_2, N_2O, etc.) produced when grout, prepared using tank waste, is heated at 65 C. Experiments will also be conducted using grout from synthetic tank waste, as practice. Purpose is to provide data for evaluation of safety risks presented by gas generation in the grout vault after making grout with tank waste, as verification/confirmation for gas generation rates for the ANL testing.

7417 (WHC-SD-WM-TP–206) **Tank 241-C-102 tank characterization plan.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004977. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, WHC 222-S Laboratory, and PNL 325 Analytical Chemistry Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples from tank 241-C-102.

7418 (WHC-SD-WM-TP–219-Rev.1) **Engineering test plan for Tank 241-SY-101 In situ viscometer. Revision 1.** Stokes, T.I.; Pearce, K.L. Westinghouse Hanford Co., Richland, WA (United States). 12 Oct 1994. 33p. Sponsored by USDOE, Washington, DC

(United States). DOE Contract AC06-87RL10930. Order Number DE95002118. Source: OSTI; NTIS; INIS; GPO Dep.

To obtain in situ measurements of the rheological properties within tank 241-SY-101, this document will implement the test strategy defined in PNLMIT-041994, Acquisition and Reduction of Data Obtained in Tank SY-101 with the Ball Rheometer. Instructions for all sequences are defined within the procedure. All safety requirements as defined in LA-UR-92-3196, A Safety Assessment for Proposed Mixing Operations to Mitigate Episodic Gas Releases in Tank 241-101-SY have been implemented into this procedure.

7419 (WHC-SD-WM-TP–293) **Tank 241-TX-105 tank characterization plan.** Carpenter, B.C. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004978. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, WHC 222-S Laboratory, Oak Ridge National Laboratory, and PNL tank vapor program. The scope of this plan is to provide guidance for the sampling and analysis of vapor samples from tank 241-TX-105.

7420 (WHC-SD-WM-TP–298) **241-BY-106 sampling test plan.** Bogen, G.J. Westinghouse Hanford Co., Richland, WA (United States). 18 Jan 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005976. Source: OSTI; NTIS; INIS; GPO Dep.

This plan outlines the approach to be taken on obtaining the second core from 241-BY-106, riser 10B, using the Rotary Mode Core Sample Truck (RMCST). The purpose for obtaining the second core is to retrieve the final segments to determine ferrocyanide content. The first core acquired from riser 10B resulted in inadequate sample recovery for the labs to perform the required analysis. Thirteen samples were taken, with recovery varying from 0 to 100%. The most likely contributors to poor sample recovery have been identified and explained on a sample-by sample basis as outlined in this report. This information has been used to devise the approach to be taken in obtaining the second core.

7421 (WHC-SD-WM-TRP–229) **Test report – Prototype core sampler.** Linschooten, C.G. Westinghouse Hanford Co., Richland, WA (United States). 17 Jan 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005987. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this test is to determine the adequacy of the prototype sampler, provided to Westinghouse Hanford Company (WHC) by DOE-RL. The sampler was fabricated for DOE-RL by the Concord Company by request of DOE-RL. This prototype sampler was introduced as a technology that can be easily deployed (similar to the current auger system) and will reliably collect representative samples. The sampler is similar to the Universal Sampler i.e., smooth core barrel and piston with an O-ring seal, but lacks a rotary valve near the throat of the sampler. This makes the sampler inappropriate for liquid sampling, but reduces the outside diameter of the sampler considerably, which should improve sample recovery. Recovery testing was performed with the supplied sampler in three different consistencies of Kaolin sludge simulants.

7422 (WHC-SD-WM-VI–014) **Evaluation of plasma melter technology for verification of high-sodium content low-level radioactive liquid wastes: Demonstration test No. 4 preliminary test report.** McLaughlin, D.F.; Gass, W.R.; Dighe, S.V.; D'Amico, N.; Swensrud, R.L.; Darr, M.F. Westinghouse Hanford Co., Richland, WA (United States). 10 Jan 1995. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005624. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a preliminary report of plasma arc vitrification testing by a vendor in support of the Hanford Tank Waste Remediation System Low-Level Waste (LLW) Vitrification Program. Phase I test conduct included 26 hours (24 hours steady state) of melting of simulated high-sodium low-level radioactive liquid waste. Average processing rate was 4.9 kg/min (peak rate 6.2 kg/min), producing 7330 kg glass product. Free-flowing glass pour point was 1250 C, and power input averaged 1530 kW(e), for a total energy consumption of 19,800 kJ/kg glass. Restart capability was demonstrated following a 40-min outage involving the scrubber liquor heat exchanger, and glass production was continued for another 2 hours. Some volatility losses were apparent, probably in the form of sodium borates. Roughly 275 samples were collected and forwarded for analysis. Sufficient process data were collected for heat/material balances. Recommendations for future work include lower boron contents and improved tuyere design/operation.

7423 (WHC-SD-WM-WP–218-Rev.1) **Work plan for upgrading the 241-A-701 compressed air system and motor control center. Revision 1.** Carpenter, K.E. Westinghouse Hanford Co., Richland, WA (United States). 17 Jan 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005990. Source: OSTI; NTIS; INIS; GPO Dep.

This work plan will outline the responsibilities associated with the 241-A-701 Compressed Air System (CAS) and Motor Control Center (MCC) upgrades. All activities required to design, install, test, and operate the modified systems are addressed in this document. Upgrades Technical Support (UTS) of TWRS Engineering is responsible for the completion of all tasks associated with this upgrade. UTS will coordinate the upgrade activities, and ensure all tasks are successfully completed on or before the scheduled dates. The primary objective of the 241-A-701 Compressor and MCC Upgrade is to provide a reliable source of process and instrument compressed air to the A, AX, AY, and AZ tank farms.

7424 (WHC-SP–1108) **Quality assurance FY 1995 site support program plan WBS 6.7.2.5.** Dell, L.D. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004976. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a summary of the quality assurance plan and program for the Westinghouse Hanford Company. The quality assurance plan verifies that the appropriate quality assurance programs and controls are applied to activities that affect quality related to work in: waste management; environmental activities (restoration, remediation, and monitoring); implementation of environmental, state, local, and federal regulations; tri-party agreement activities; facility operation and deactivation/transition to shutdown; new facility construction and operation.

7425 (WSRC-MS–94-0203P) **Characterization of high-level waste saltcake stored at the Savannah River Site.** Hobbs, D.T.; Coleman, C.J. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-940813–35: 208. American Chemical Society national meeting, Washington, DC (United States), 21-26 Aug 1994). Order Number DE95005885. Source: OSTI; INIS; NTIS; GPO Dep.

Approximately 34 million gallons of high-level nuclear waste (HLW) are stored at the Savannah River Site (SRS) in 51 underground storage tanks. Facilities have been constructed to permanently dispose of this waste. The radioactive components will be separated from the bulk of the waste into a small volume fraction and vitrified in the Defense Waste Processing Facility (DWPF). The remaining, much larger volume fraction will be incorporated into a cement waste form in the Saltstone facility. Most of the radioactivity in the HLW is present in a solids fraction referred to as sludge. These solids are produced upon addition of sodium hydroxide to the acidic waste solutions to provide a highly alkaline slurry. The highly alkaline condition is necessary to prevent corrosion of the carbon steel storage tanks. After allowing the sludge solids to settle, the waste solutions are decanted and evaporated to conserve storage space in the tanks. Upon cooling, salts are crystallized from the evaporated wastes. The crystallized salts are referred to as saltcake.

7426 (WSRC-MS–94-0453) **Cadmium Control and Safety Rod Disposal at the Savannah River Site.** McInnis, S.H. Bechtel Savannah River, Inc., Aiken, SC (United States). 18 Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC09-89SR18035. (CONF-950216–6: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060088. Source: OSTI; NTIS; INIS; GPO Dep.

A total of 862 activated cadmium control-safety rods will be removed from four heavy water moderated reactors at the Savannah River Site. The cadmium rods are mixed waste and must be disposed of in accordance with the Resource Conservation and Recovery Act . Determining a viable design plan for a 40-year-old facility while meeting today's standards, at a moderate cost, proved to be quite a challenge. First, a method to remove, handle and load these long, small-diameter cadmium rods from the reactor tank had to be determined. Second, a shielded cask that could fit in the small transfer pools and could hold the control rods, had to be located or designed. Third, the waste acceptance requirements, the RCRA requirements and the logistical difficulties in meeting these requirements had to be addressed. These difficulties were resolved through close interpretation of the RCRA laws, involved management, strong communication, and detailed engineering.

7427 (WSRC-MS–94-0600) **Deflagration-induced pressure and temperature transients in a waste storage facility.** Ades, M.J.; Polizzi, L.M. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950439–1: SMS simulation multiconference: simulation as a critical technology, Phoenix, AZ (United States), 9-13 Apr 1995). Order Number DE95004349. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a study for a facility where a deflagration of flammable vapors takes place, and the generated pressure and temperature transients are analyzed to evaluate the pressure differentials induced on the various components of the facility to assesses their structural integrity. The temperature profiles are also analyzed to assess the qualification of the equipment that is required to operate during and after such an accident.

7428 (WSRC-MS–94-0608) **The stainless steel beneficial reuse integrated demonstration.** Boettinger, W.L.; Lutz, R.N. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–11: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95005888. Source: OSTI; NTIS; INIS; GPO Dep.

Process water heat exchangers at SRS contains over 95% 304 stainless steel which could be recycled back to DOE in a "controlled release" manner, that is, the radioactive scrap metal (RSM) could be reprocessed into new reusable products for return to DOE for use within the DOE Complex. In 1994, a demonstration was begun to recycle recycle contaminated stainless steel by melting 60 tons of RSM and refabricating it into containers for long-term temporary storage. The demonstration covers the entire recycle chain; the melting and the fabrication are to be done through subcontracts with private industry. Activity level of RSM to be supplied to industry is less than one curie total; the average specific activity level of the cobalt-60 which will be imbedded in the final products was estimated to be 117 pico curies per gram (4.31 becquerels/gram).

7429 (WSRC-MS–95-0012) **Vitrification Studies with DOE Low-Level Mixed Waste Wastewater Treatment Sludges.** Cicero, C.A. (Westinghouse Savannah River Co., Aiken, SC (United States)); Andrews, M.K.; Bickford, D.F.; Hewlett, K.J.; Bennert, D.M.; Overcamp, T.J. Westinghouse Savannah River Co., Aiken, SC (United States). 13 Jan 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–5: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060083. Source: OSTI; NTIS; INIS; GPO Dep.

Vitrification studies with simulated Low Level Mixed Waste (LLMW) sludges were performed at the Savannah River Technology Center (SRTC). These studies focused on finding the optimum glass compositions for four simulated LLMW wastewater treatment sludges and were based on both crucible-scale and pilot-scale studies. Optimum compositions were determined based on the maximum waste loading achievable without sacrificing glass integrity.

7430 (WSRC-MS–95-0013) **Radiolytic Hydrogen Production During the Long Term Storage of Spent Organic Ion Exchange Resins.** Crawford, C.L.; Bibler, N.E. Westinghouse Savannah River Co., Aiken, SC (United States). 13 Jan 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–7: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060084. Source: OSTI; NTIS; INIS; GPO Dep.

Organic ion exchange resins are used at Savannah River Site (SRS) and Hanford as well as many commercial nuclear installations to remove radionuclides from process waters that have become contaminated. Contamination of reactor moderator water can occur during reactor operation or the water in basins used to store spent fuel such as the K-basin at Hanford can become contaminated. After these resins have been used to the extent that they are no longer efficient for removing the radionuclides, the resins need to be stored and eventually placed in permanent disposal. During this storage, radiolysis from the radionuclides on the resin produces hydrogen and can create a flammable mixture in the storage container. Recent reviews stressing the importance of understanding the effects of radiation on resins used in the nuclear industry have been published. This report presents results of radiolysis studies designed to provide an estimate of the rate of hydrogen production from two commonly used resins so that the time to reach a flammable mixture (4 percent hydrogen in air) in the storage container can be estimated. We also include in this report further studies on our previously reported investigation of the radiolytic stability of a resorcinol-formaldehyde ion exchange resin. The resorcinol-formaldehyde polycondensation-type cation exchange resin is currently being investigated for potential cesium removal applications at Hanford and the Savannah River Site.

7431 (WSRC-MS–95-0025) **Experimental Chemical Milling Process to Decontaminate and Disposition Reactor Fuel at the Savannah River Site.** Davis, J.R.; Ross, R.H. Westinghouse Savannah River Co., Aiken, SC (United States). 13 Jan 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–10: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060086. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents the results of a scoping test to determine if a large scale chemical etching process would be effective at extraction of radionuclide and other hazardous contaminants from manufactured fuel tubes and assemblies. A review of the effectiveness of this process against other similar solid materials is considered. Because contaminants in contact with these types of materials tend to become electrostatically bonded to the substrate material, successful removal requires a chemical reaction to break these bonds. The process proposed is effective at bond deactivation and maintains an advantage over other decontamination alternatives due to its highly effective extraction of subsurface as well as surface contaminants. The large scale repeatability of the process makes it applicable to many areas of DOE decontamination and dismantlement activities complex wide.

7432 (WSRC-MS–95-0028) **Development of a Transportable Vitrification System for Mixed Waste.** Whitehouse, J.C. (Westinghouse Savannah River Co., Aiken, SC (United States)); Jantzen, C.M.; Bickford, D.F.; Kielpinski, A.L.; Helton, B.D.; Van Ryn, F. Westinghouse Savannah River Co., Aiken, SC (United States). 13 Jan 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–9: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060087. Source: OSTI; NTIS; INIS; GPO Dep.

The US DOE through the Mixed Waste Integrated Program, has identified a need to move mixed waste vitrification technology from the laboratory to the field as rapidly as possible. A great deal of work over the last few years has shown the feasibility of immobilizing selected hazardous waste streams in a vitrified product. Lab-scale work has been extended to pilot-scale tests, usually with surrogates of the actual waste. DOE felt that the technology was mature enough to allow demonstration in the field, on actual wastes, with units that would be prototypic of full sized waste

treatment equipment. To this end, DOE's Office of Technology Development sponsored the Westinghouse Savannah River Company (WSRC) to specify, procure, test, and operate a field scale demonstration using mobile equipment. Oak Ridge Reservation was chosen as the initial location for the field demonstration and Martin Marietta Reservation was chosen as the initial location for the field demonstration and Martin Marietta Energy Systems (MMES) tasked with all permitting, site preparation, and field support activities. During September 1993, WSRC used a "Vendor Forum" to solicit preliminary proposals for the Transportable Vitrification System (TVS). A number of quality proposals were received and evaluated. A vendor was selected and detailed negotiations were completed in August 1994, at which time a contract was signed for the TVS. In parallel, WSRC opened a dialogue with MMES to explore candidate waste streams at the Oak Ridge Reservation for the first TVS vitrification campaign. After some preliminary work, a group of waste water sludges were selected. The first of these to be demonstrated with the TVS will be the West End Treatment Facility (WETF) sludge. This paper describes the development of the specification for the TVS, the design and construction activities to date, and ongoing efforts for permitting and site support. The schedule for field application is also discussed.

7433 (WSRC-RP–94-1272) **Cesium cobaltdicarbollide-solubility, precipitation, and reactivity in basic aqueous solution.** McCabe, D.J.; Fanning, J.C.; Hugg, L.A.; Smith, W.A.; Terrell, A.S.; Yasinsac, L.; Todd, L.J.; Jasper, S.A. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005881. Source: OSTI; NTIS; INIS; GPO Dep.

The title compound, $Cs^+[Co((3)\text{-}1,2\text{-}C_2B_9H_{11})_2]^-$(CsCDC), was precipitated with a NaCDC solution from solutions containing CsCl. The reaction was followed by measuring loss of light intensity as the precipitate formed. The $[Cs^+]$ and $[CDC^-]$ at the point of precipitation were estimated and approximate values of the K_{sp} for CsCDC determined at room temperature: 8×10^{-6} (water), 7×10^{-6} (1 M NaOH), and 2×10^{-6} (5M NaCl/0.1 M KOH/1.0 M NaOH). In some cases, NaCDC precipitated from solution when added to the latter salt solution. For the medium, 5 M $NaNO_3$/0.1 M KOH/1.0 M NaOH a four-fold excess of NaCDC was added to a 10mM Cs^+ solution at 40°C and the $[CDC^-]$ measured spectrophotometrically. Only CsCDC precipitated, and a K_{sp} of 3.9×10^{-6} was determined. The solubilities of CsCDC were measured in $NaNO_3$ and NaCl solutions at 30_C as a function of the Na salt concentration. Reaction of the CDC^- with OH^- slowly produces $B(OH_4^-$, H_2, and CoO(OH). Reaction of 22 μM CsCDC with 1M NaOH has a first order rate constant at 56°C of 8.8×10^{-7} s^{-1}, while that for 14 mM NaCDC is 7.2×10^{-7} s^{-1}. Activation energy for the reaction is 110 kJ.

7434 (WSRC-TR–94-0221) **Melter feed tank operating map from the FA-10.02 test data.** Spatz, T.L. Westinghouse Savannah River Co., Aiken, SC (United States). Aug 1994. 128p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005011. Source: OSTI; NTIS; INIS; GPO Dep.

The operability of the Melter Feed Tank (MFT) feed loops has been tested during the DWPF-FA-10.02 test. The ability to feed the melter at three distinct melter feed rates (0.20, 0.45, and 0.90 gpm), two distinct agitator speeds (65 and 130 rpm), varying liquid levels, and varying slurry rheologies was tested. This report correlates the operability of the feed loops with the above mentioned variables. The data are presented in the form of operating maps, Figs. 1 through 4, which are plots of the liquid level versus the wt% total solids (and yield stress) for two agitator speeds. The maps are divided into regions of acceptable feed loop operation and unacceptable feed loop operation. This report does not consider how closely the compositions of the MFT, the melter feed lines, and the Hydragard samples agree. The significant observations in this report are as follows: Both feed loops satisfy the operability criteria down to a liquid level below the upper impeller blade at low speed agitation (65 rpm). Under high speed agitation (130 rpm), feed loop No. 2 operates much more poorly than feed loop No. 1. The uncertainty associated with the wt% total solids of a slurry sample is larger than the current design basis range for total solids. The dilution of slurry due to pump priming is shown graphically in the chronological presentation of wt% total solids.

7435 (WSRC-TR–94-0311) **Sampling and analysis of soil from the old F-Area effluent ditch and its surrounding wetlands.** Dixon, K.L. Westinghouse Savannah River Co., Aiken, SC (United States). Jun 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005889. Source: OSTI; NTIS; INIS; GPO Dep.

Four surface soil samples were collected from the wetlands at the old F-Area effluent ditch. All samples were collected near shallow well point locations except FHB012, which was collected from the effluent ditch stream sediment. Samples were analyzed for metals, Target Compound List volatile organic compounds, and gross radiological indicators. Barium, beryllium, and zinc were detected in all four samples and antimony was detected in three of four samples. These metals occur naturally in the wetland soils at the SRS. Comparisons of metals concentrations were male to concentration ranges taken from background wetland soil samples. These comparison, showed that barium and beryllium concentrations were within expected ranges while zinc and antimony concentrations were elevated above expected concentration ranges. Volatile organic compounds were detected in all four samples. Detected compounds included acetone, 2-butanone, chloromethane, cis-1,2-dichloroethene, and toluene. The only radionuclide detected in a significant quantities was tritium which was detected in all four samples.

7436 (WSRC-TR–94-0326) **Analysis of glycerin waste in A-Area sanitary treatment facility material.** Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95004802. Source: OSTI; NTIS; INIS; GPO Dep.

TNX has a large supply of 55 gallon drums containing pure glycerin and glycerin with additives. The glycerin drums were procured to simulate the glass stream in a pilot-scale melter process at TNX. Since the glycerin was not used for this process, TNX is looking at disposing the material in a sanitary waste treatment facility onsite. The effect of adding the contents of the drums to sewage bacteria was tested. A drum of pure glycerin and a drum of glycerin mixed with lithium chloride were tested. The test consisted of mixing sanitary sludge material with the glycerin material. The purpose of the test was to determine if the glycerin impacted the aerobic bacterial population. The bacterial densities were determined by taking samples from the sludge/glycerin mixtures and using aerobic plate count methods. The total organic carbon (TOC) levels were measured before and after testing. The results indicate that the cell density of the aerobic bacteria increased with the addition of glycerin and the glycerin mixture and the TOC removal rate was different for all tests. Disposal of glycerin in the wastewater treatment facilities should pose no problems. Additional testing and analysis of the mixed samples should be done before its disposal in a waste water treatment facility.

7437 (WSRC-TR–94-0437) **Mass transfer model for two-layer TBP oxidation reactions.** Laurinat, J.E. Westinghouse Savannah River Co., Aiken, SC (United States). 28 Sep 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95004806. Source: OSTI; NTIS; INIS; GPO Dep.

To prove that two-layer, TBP-nitric acid mixtures can be safely stored in the canyon evaporators, it must be demonstrated that a runaway reaction between TBP and nitric acid will not occur. Previous bench-scale experiments showed that, at typical evaporator temperatures, this reaction is endothermic and therefore cannot run away, due to the loss of heat from evaporation of water in the organic layer. However, the reaction would be exothermic and could run away if the small amount of water in the organic layer evaporates before the nitric acid in this layer is consumed by the reaction. Provided that there is enough water in the aqueous layer, this would occur if the organic layer is sufficiently thick so that the rate of loss of water by evaporation exceeds the rate of replenishment due to mixing with the aqueous layer. This report presents measurements of mass transfer rates for the mixing of water and

butanol in two-layer, TBP-aqueous mixtures, where the top layer is primarily TBP and the bottom layer is comprised of water or aqueous salt solution. Mass transfer coefficients are derived for use in the modeling of two-layer TBP-nitric acid oxidation experiments. Three cases were investigated: (1) transfer of water into the TBP layer with sparging of both the aqueous and TBP layers, (2) transfer of water into the TBP layer with sparging of just the TBP layer, and (3) transfer of butanol into the aqueous layer with sparging of both layers. The TBP layer was comprised of 99% pure TBP (spiked with butanol for the butanol transfer experiments), and the aqueous layer was comprised of either water or an aluminum nitrate solution. The liquid layers were air sparged to simulate the mixing due to the evolution of gases generated by oxidation reactions. A plastic tube and a glass frit sparger were used to provide different size bubbles. Rates of mass transfer were measured using infrared spectrophotometers provided by SRTC/Analytical Development.

7438 (WSRC-TR–94-0462) **Evaluation of the effectiveness of the sealed double-ringed infiltrometers and the effects of changes in atmospheric pressure on hydraulic conductivity.** McMullin, S.R. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-941124–9: 33. Hanford symposium on health and the environment: symposium on in-situ remediation–scientific basis for current and future technologies, Richland, WA (United States), 7-11 Nov 1994). Order Number DE95002695. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Site (SRS) is currently evaluating some 40 hazardous and radioactive-waste sites for remediation. A remedial alternative under consideration is the closing of a waste site with a RCRA-style closure cap. The closure cap is a moisture barrier designed to inhibit the free flow of water downward into the buried wastes. When a remedial design is prepared, it is often necessary to test the cap materials to verify compliance with this recommended limit. Among the EPA-recommended test instruments is the sealed double-ring infiltrometer (SDRI). During recent testing at the Savannah River Site (SRS), six SDRI were installed and tested on a single kaolin clay cap. The purpose of this testing was to obtain a measure of the distribution of hydraulic conductivity across a model kaolin clay cap. The test results provide an evaluation of instrument performance and a measure of the repeatability of results. In addition, the testing identified variations in the unsaturated hydraulic conductivity. This paper presents an overview of the SDRI, the testing program at SRS, and an evaluation of the observations and test results.

7439 (WSRC-TR–94-0509) **Development of Liquid Level and Density Bubbler for DWPF Canyon Vessels. Final report.** Duignan, M.R.; Barnes, A.B. Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1994. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060075. Source: OSTI; NTIS; GPO Dep.

Under Activity No. SRT-ETF-TT-94003-0 (approved March 31, 1994), which is the result of Technical Assistance Request 93-DWPT-PMC-A0002 (issued February 2, 1994), an experiment was performed to test several alternate liquid-level and density measuring bubbler tubes to replace the standard straight tube bubbler sensor used in DWPF canyon vessels and Holledge-type sensors, which are currently in use. This report describes an experiment that elicited positive results from two alternate bubbler tubes that incorporate all of the advantages of the fundamentally simple straight tube bubbler while trying to minimize plugging.

7440 (WSRC-TR–95-0014) **Upfront Delisting of F006 Mixed Waste.** Poulos, D.G.; Pickett, J.B.; Jantzen, C.M. Westinghouse Savannah River Co., Aiken, SC (United States). 13 Jan 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–8: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060085. Source: OSTI; NTIS; INIS; GPO Dep.

The US DOE at the Savannah River Site will petition the US EPA to upfront delist treatment residues generated from the vitrification of approximately 650,000 gallons of a regulated mixed (hazardous and radioactive) waste. The upfront petition, based on bench-scale treatability studies and pilot-scale system data, will exclude the vitrified wasteform from hazardous waste management regulations. The EPA encourages the use of the upfront delisting method as it allows applicants prior knowledge of waste specific treatment standards, which when met will render the waste non-hazardous, before generating the final wasteform. To meet the EPA performance based treatment standards, the waste must be stabilized to control the leaching of hazardous and radioactive constituents from the final wasteform. SRS has contracted a vendor to stabilize the mixed waste in a temporary Vitrification Treatment Facility (VTF). The EPA has declared vitrification as the Best Demonstrated Available Technology for high level radioactive wastes and the DOE Office of Technology Development has taken the position that mixed waste needs to be stabilized to the highest degree possible to ensure that the resulting wasteform meets both current and future regulatory specifications. Treatability studies conducted on a VTF pilot-scale system unit indicates that the mixed waste can be converted into a highly durable glass form, which exceeds the projected EPA performance based criteria. Upfront petitions can be processed by the EPA concurrently during facility construction or permitting activities; therefore, the SRS VTF will be capable of producing wastes which are considered non-hazardous sooner than otherwise expected. At the same time, EPA imposed conditional testing requirements to verify that the delisting levels are achieved by the fully operational VTF, ensures that only non-hazardous wastes are removed from hazardous waste management regulations. Vitrification of the (Abstract Truncated).

7441 (ANL/CMT/PP–82412) **Uranium-contaminated soils: Ultramicrotomy and electron beam analysis.** Buck, E.C.; Dietz, N.L.; Bates, J.K.; Cunnane, J.C. Argonne National Lab., IL (United States). Feb 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004644. Source: OSTI; NTIS; INIS; GPO Dep.

Uranium-contaminated soils from the U.S. Department of Energy (DOE) Fernald Site, Ohio, have been examined by a combination of scanning electron microscopy with backscattered electron imaging (SEM/BSE) and analytical electron microscopy (AEM). The inhomogeneous distribution of particulate uranium phases in the soil required the development of a method for using ultramicrotomy to prepare transmission electron microscopy (TEM) thin sections of the SEM mounts. A water-miscible resin was selected that allowed comparison between SEM and TEM images, permitting representative sampling of the soil. Uranium was found in iron oxides, silicates (soddyite), phosphates (autunites), and fluorite (UO_2). No uranium was detected in association with phyllosilicates in the soil.

7442 (DOE/AL/65030–9413) **Environmental report for Pantex Plant, 1993.** Mason and Hanger-Silas Mason Co., Inc., Amarillo, TX (United States). Jun 1994. 168p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL65030. Order Number DE95006378. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents summaries and interpretations of the environmental monitoring data collected during 1993 at Pantex Plant. Additionally, it outlines site environmental management performance, summarizes compliance with applicable environmental regulations, and describes significant programs and achievements. Environmental monitoring is composed of two principal collection and analysis activities for radiological and nonradiological constituents: (1) effluent monitoring involving liquid and airborne effluents to characterize and quantify releases and (2) environmental surveillance involving water, soil, vegetation, and biota and measurement of external radiation to characterize environmental impacts of Pantex Plant. Data are used to assess impacts of operations to the public and the environment and to demonstrate compliance with applicable standards for both radiological and nonradiological contaminants. In 1993 more than 270 onsite and offsite locations were monitored regularly with 4000 samples collected and analyzed. Data from a location at the US Department of Agriculture Bushland Agricultural Research Service and historical data are also presented for reference.

7443 (DOE/NV/10845–T20) **Area 5 Site characterization project report, FY 1994.** Albright, W.; Tyler, S.; Chapman, J.; Miller, M.; Estrella, R. USDOE Economic Regulatory Administration, Washington, DC (United States). Office of Utility Systems. Sep 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE95006254. Source: OSTI; NTIS; INIS; GPO Dep.

The Area 5 Site Characterization Project is designed to determine the suitability of the Radioactive Waste Management Site (RWMS) for disposal of low-level waste (LLW), mixed waste (MW) and transuranic waste (TRU). The Desert Research institute (DRI) has conducted this study for the Area 5 Site Characterization Project for the US Department of Energy, Nevada Operations Office (DOE/NV), Waste Management Division (WMD). The purpose of DRI's Area 5 Site Characterization Project is to characterize important properties of the upper vadose zone which influence infiltration and redistribution of water and transport of solutes as well as to characterize the water quality and hydrologic conditions of the uppermost aquifer. This report describes methods and presents a summary of all data and results from laboratory physical and chemical testing from borehole samples through September 1994. DRI laboratories performed soil water content, soil water potential, soil bulk density, and soil water extract isotope analyses.

7444 (DOE/RL–91-50-Rev.1) **Environmental Monitoring Plan, United States Department of Energy, Richland Operations Office. Revision 1.** Pacific Northwest Lab., Richland, WA (United States). 9 Nov 1994. 523p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006731. Source: OSTI; NTIS; INIS; GPO Dep.

This report describes environmental monitoring activities at Hanford Reservation. Attention is focused on effluent monitoring and environmental surveillance. All Hanford contractors reviewed potential sources of contamination. A facility effluent monitoring plan was written for each facility with the potential to release significant quantities of hazardous materials, addressing both radiological and nonradiological effluent monitoring. The environmental surveillance program assesses onsite and offsite environmental impacts and offsite human health exposures. The program monitors air, surface water, sediment, agricultural products, vegetation, soil, and wildlife. In addition, independent onsite surveillance is conducted to evaluate the effectiveness of Hanford Site effluent controls in order to comply with applicable environmental standards and regulations.

7445 (ES/ER/TM–123) **Airborne geophysical survey of the Oak Ridge Reservation, Tennessee.** Doll, W.E.; Nyquist, J.E.; Beard, L.P. Oak Ridge National Lab., TN (United States); Paducah Gaseous Diffusion Plant, KY (United States). Jul 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; AC05-76OR00001. Order Number DE95004744. Source: OSTI; NTIS; INIS; GPO Dep.

High-resolution and reconnaissance data, acquired using sensors mounted on a helicopter, were used to characterize waste sites and detect geologic properties that influence contaminant transport on the Oak Ridge Reservation (ORR), Tennessee, between December 1992 and April 1994. To date, these data have been used to support several ORR Environmental Restoration (ER) programs. This report summarizes the techniques used, the ways in which the data have been applied to date, and current plans for enhancing the data and making them more useful to the ER programs.

7446 (INIS-mf–14436) **The mining Pribram in science and technology. Section O: Mining and the environment.** Reichmann, F.; Novak, F. (eds.). No corporate text available. Oct 1993. 157p. (In Czech). (CONF-9310403–: The mining Pribram in science and technology, Pribram (Czech Republic), 13-16 Oct 1993). Order Number DE95612417. Source: OSTI; NTIS (US Sales Only); INIS.

The proceedings contain 18 contributions, out of which 10 have been inputted in INIS. These deal with remedial work in uranium mining regions, geological environmental problems in the surroundings of uranium deposits, radioactivity monitoring at uranium mining sites, provisions to reduce environmental impacts of mining, and changes in the ground water regime due to uranium mining. (J.B.).

Section O: Mining and the environment.* Order Number DE95612417. Source: OSTI; NTIS (US Sales Only); INIS.

Over the entire period of hydrochemical extraction of uranium from the Straz pod Ralskem deposit (ie., since 1968), about 4 million tons of sulfuric acid, 170 thousand tons of nitric acid, 103 thousand tons of ammonia, and 25 thousand tons of hydrofluoric acid were pressed underground over an area of 28 km^2. This resulted in ground water pollution. The Czech Government therefore adopted provisions for remedial actions, consisting in pumping the leaching solutions and contaminated ground water up to the ground, and in their purification. Conditions are given for the treatment of the solutions within the proposed remedial conception. (J.B.). 4 refs.

7448 (INIS-mf–14436, pp. O18.1-O18.5) **Addressing the environmental burden remained after uranium surveying, mining and milling.** Kucera, M. (DIAMO s.p., Straz pod Ralskem (Czech Republic)); Kuehn, P. No corporate text available. Oct 1993. 157p. (In Czech). (CONF-9310403–: The mining Pribram in science and technology, Pribram (Czech Republic), 13-16 Oct 1993). In *The mining Pribram in science and technology. Section O: Mining and the environment.* Order Number DE95612417. Source: OSTI; NTIS (US Sales Only); INIS.

The environmental burden which remained after the surveying, mining and milling activities of the former Czechoslovak uranium industry is briefly characterized. The procedure of a systematic examination of all the affected sites is outlined. The problems of remedial actions are discussed; these include: setting up a complete inventory of the sites, evaluating their environmental impacts, assessing their risk, determining priorities in the remedial actions and setting up remedial project models, and funding of the actions. (J.B.).

7449 (INIS-mf–14436, pp. O6.1-O6.6) **Geological environmental problems in the surroundings of the Olsi uranium deposit.** Manour, J. (Cesky Geologicky Urad, Prague (Czech Republic)); Prochazka, J.; Slovak, J. No corporate text available. Oct 1993. 157p. (In Czech). (CONF-9310403–: The mining Pribram in science and technology, Pribram (Czech Republic), 13-16 Oct 1993). In *The mining Pribram in science and technology. Section O: Mining and the environment.* Order Number DE95612417. Source: OSTI; NTIS (US Sales Only); INIS.

Gamma radiation was measured, radon risk parameters were determined, the conditions of and changes in the surface and underground water chemism were evaluated, and the water deposit and soil pollution was examined in the surroundings of the Olsi uranium deposit. Gamma spectrometry revealed radioactivity of tailings due to uranium concentrations of 100 to 361 ppm. With respect to radon concentrations, the territory was divided into 3 risk sectors. In addition to volume activities of radon in air, the instantaneous volume activities in some buildings were also measured; the limiting value of 200 Bq/m^3 was found exceeded in 3 buildings. Surface water pollution was mostly below the permissible values, with few exceptions. High U, Mo, Ni and Be concentrations were found in the ground water. The sediment pollution corresponds to the natural situation before the mining. The soil pollution level is low. (J.B.). 7 figs., 9 refs.

In *The mining Pribram in science and technology. Section O: Mining and the environment.* Order Number DE95612417. Source: OSTI; NTIS (US Sales Only); INIS.

The geology and hydrogeology are characterized of the Cenomanian and Turonian collectors in the uranium deposit region near the town of Straz pod Ralskem. The ground water regime was

changed by pumping off 760 m^3 and pressing in 470 m^3 of solutions (out of this, 450 and 150 m^3 of water, respectively). This brought about an overall change in the hydraulic situation. The uranium mining also led to significant changes in the chemical composition of ground water in the Cenomanian collector; the Turonian collector has also been affected to some extent. Anomalously high concentrations of contaminants in the investigated region brought about by changes in the ground water regime, pose a major risk. The basic principles of a system approach to rectifying this situation are explained. (J.B.). 1 tab., 7 figs., 7 refs.

Environmental Sciences Division Publication Number 4268.

Modeling the movement of hazardous waste in groundwater was identified by the US Department of Energy (DOE) as one of the grand challenges in scientific computation. In recognition of this need, DOE has provided support for a group of scientists from several national laboratories and universities to conduct research and development in groundwater flow and contaminant transport modeling. This group is part of a larger consortium of researchers, collectively referred to as the Partnership in Computational Science (PICS), that has been charged with the task of applying high-performance computational tools and techniques to grand challenge areas identified by DOE. One of the goals of the PICS Groundwater Group is to develop a new three-dimensional groundwater flow and transport code that is optimized for massively parallel computers. An existing groundwater flow code, 3DFEMWATER, was parallelized in order to serve as a benchmark for these new models. The application of P-FEM, the parallelized version of 3DFEMWATER, to a real field site is the subject of this report.

7452 (PNL-SA–23775) **Direct measurements of transport properties are essential for site characterization.** Wright, J. (Pacific Northwest Lab., Richland, WA (United States)); Conca, J.L. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940815–105: International nuclear and hazardous waste management conference, Atlanta, GA (United States), 14-18 Aug 1994). Order Number DE95004940. Source: OSTI; NTIS; INIS; GPO Dep.

Direct measurements of transport parameters on subsurface sediments using, the UFA method provided detailed hydrostratigraphic mapping, and subsurface flux distributions at a mixed-waste disposal site at Hanford. Seven hundred unsaturated conductivity measurements on fifty samples were obtained in only six months total of UFA run time. These data are used to provide realistic information to conceptual models, predictive models and restoration strategies. The UFA instrument consists of an ultracentrifuge with a constant, ultralow flow pump that provides fluid to the sample surface through a rotating seal assembly and microdispersal system. Effluent from the sample is collected in a transparent, volumetrically-calibrated chamber at the bottom of the sample assembly. Using a strobe light, an observer can check the chamber while the sample is being centrifuged. Materials can be run in the UFA as recomposited samples or in situ samples can be subcored directly into the sample UFA chamber.

7453 (PNL-SA–24176) **Alpha spectral analysis via artificial neural networks.** Kangas, L.J. (Pacific Northwest Lab., Richland, WA (United States)); Hashem, S.; Keller, P.E.; Kouzes, R.T.; Troyer, G.L. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941061–13: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95004567. Source: OSTI; NTIS; INIS; GPO Dep.

An artificial neural network system that assigns quality factors to alpha particle energy spectra is discussed. The alpha energy spectra are used to detect plutonium contamination in the work environment. The quality factors represent the levels of spectral degradation caused by miscalibration and foreign matter affecting the instruments. A set of spectra was labeled with a quality factor by an expert and used in training the artificial neural network expert system. The investigation shows that the expert knowledge of alpha spectra quality factors can be transferred to an ANN system.

7454 (USGS/OFR–94-303) **Water levels in wells J-11 and J-12, 1989-91, Yucca Mountain Area, Nevada.** Boucher, M.S. Geological Survey, Denver, CO (United States). 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI08-92NV10874. Order Number DE95004831. Source: OSTI; NTIS; INIS; U.S. Geological Survey, Earth Science Information Center, Open-File Reports Section, Box 25286, MS 517, Denver Federal Center, Denver, CO 80225; GPO Dep.

Water levels have been measured in the Yucca Mountain area, Nevada, since 1981 in order to gain a better understanding of the ground-water flow system in the area. Water levels in wells J-11 and J-12 have been periodically measured using calibrated reeled steel tapes since 1989, however, calculation of water-level altitude was not possible prior to 1993 due to missing reference elevations. These elevations were determined in 1993 by the U.S. Geological Survey. During 1989-91, water-level altitudes for well J-11 ranged from 732.09 to 732.40 meters and the mean water-level altitude was 732.19 meters. During 1989-91, water-level altitudes for well J-12 ranged from 727.84 to 728.03 meters, and the mean water-level altitude was 727.95 meters.

7455 (WHC-EP–0813) **Ground water impact assessment report for the 216-B-3 Pond system.** Johnson, V.G.; Law, A.G.; Reidel, S.P.; Evelo, S.D.; Barnett, D.B.; Sweeney, M.D. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005055. Source: OSTI; NTIS; INIS; GPO Dep.

Ground water impact assessments were required for a number of liquid effluent receiving sites according to the Hanford Federal Facility Agreement and Consent Order Milestones M-17-00A and M-17-00B, as agreed upon by the US Department of Energy. This report is one of the last three assessments required and addresses the impact of continued discharge of uncontaminated wastewater to the 216-B-3C expansion lobe of the B Pond system in the 200 East Area until June 1997. Evaluation of past and projected effluent volumes and composition, geohydrology of the receiving site, and contaminant plume distribution patterns, combined with ground water modeling, were used to assess both changes in ground water flow regime and contaminant-related impacts.

7456 (WHC-SD-EN-TI–241) **Geophysical investigation of 216-U-8 clay vitrified pipe transfer line, 200 West Area.** Bergstrom, K.A. Westinghouse Hanford Co., Richland, WA (United States). 5 Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004508. Source: OSTI; NTIS; INIS; GPO Dep.

Two geophysical surveys were conducted over a vitrified clay pipeline (VCP) that was used to transfer liquid radioactive waste from the 224-U Building to the 216-U-8 and 216-U-12 cribs. The objectives of the surveys were to locate the VCP in the northern site, locate the bends in the VCP in the southern site, and locate possible utilities or pipelines at both sites. Ground-penetrating radar (GPR) was the method chosen for the surveys. Electromagnetic induction (EMI) was also used at the southern site to map the extent of a possible pipeline. It is very difficult to detect most VCPs with GPR, however, excavation boundaries for the pipeline are often discernible. The VCP was not identified in the GPR data at the northern site. Its anticipated depth was 10–12 ft. The VCP at the southern site appears to be much shallower. The data suggest it may be 5 ft or less below the surface in places. The edges of the excavation from N100 to N190 are between E120 and E135 and were quite distinct in the data. However, the excavation boundaries weren't apparent north of N190, suggesting that the VCP bends to the north near N200. Several profiles were extended beyond N200. These profiles detected a linear, with the characteristic signature of a pipeline, approximately 3 ft below the surface. There was no previous knowledge of the pipeline. The linear was traced across the entire surface contamination area with an EMI geophysical tool.

7457 (WHC-SD-W337-ATP–001) **Acceptance test procedure for the 340-NT-EX stack upgrades. Project W-337.** Hagerty, K.J. Westinghouse Hanford Co., Richland, WA (United States). 6 Dec 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004754. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides an Acceptance Test Procedure (ATP) for the project W-337 upgrades to the 340-NT-EX stack, and its associated sampling and monitoring systems.

7458 (WHC-SD-W337-OTP–001) **Operability test procedure for the 340-NT-EX stack upgrades – Project W337.** Hagerty, K.J. Westinghouse Hanford Co., Richland, WA (United States). 15 Dec 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005284. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of the 340-NT-EX sampling system upgrade Operability Test Procedure (OTP) is to test and ensure the sampler system upgrades correctly interface with the control room alarm and recording functions. The sampling system monitors the exhaust air from a 300 Area waste handling facility for alpha, beta, gamma, particulate, and iodine releases.

7459 (WHC-SD-WM-TI–680) **291-B-1 stack monitoring and sampling system annual system assessment report.** Ridge, T.M. Westinghouse Hanford Co., Richland, WA (United States). 16 Dec 1994. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005051. Source: OSTI; NTIS; INIS; GPO Dep.

The B Plant 291-B-1 main stack exhausts gaseous effluents to the atmosphere from the 221-B Building canyon and cells, the No. 1 Vessel Ventilation System (VVS1), the 212-B Cask Station cell ventilation system, and, to a limited capacity, the 224-B Building. VVS1 collects offgases from various process tanks in 221-B Building, while the 224-B system maintains a negative pressure in out-of-service, sealed process tanks. B Plant Administration Manual, WHC-CM-7-5, Section 5.30 requires an annual system assessment to evaluate and report the present condition of the sampling and monitoring system associated with Stack 291-B-1 (System Number B977A) at B Plant. The system is functional and performing satisfactorily.

7460 (WSRC-RP–94-522) **Verification of the MAXIGASP and POPGASP Computer Codes for Environmental Dose Assessment.** Hamby, D.M. Westinghouse Savannah River Co., Aiken, SC (United States). 19 Jan 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060074. Source: OSTI; NTIS; GPO Dep.

MAXIGASP and POPGASP are environmental dosimetry codes that are based on the NRC dispersion module, XOQDOQ, and the NRC dosimetry module, GASPAR. XOQDOQ and GASPAR have been verified previously. The four remaining modules of MAXIGASP and POPGASP control input/output functions and data transfer. The results of MAXIGASP and POPGASP have been verified by comparison of hand calculated doses with program input.

7461 (WSRC-RP–94-584) **Thirty-Year Solid Waste Generation Forecast by Treatability Group.** Thomas, C. Westinghouse Savannah River Co., Aiken, SC (United States). Jul 1994. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060080. Source: OSTI; NTIS; INIS; GPO Dep.

This report is Phase II of the Thirty-Year Solid Waste Generation Forecast for Facilities at SRS. Phase I of the forecast, Thirty-Year Solid Waste Generation Forecast for Facilities at SRS (Reference 4), forecasts the yearly quantities of LLW, hazardous, mixed, and TRU wastes generated over the next 30 years by operations, decontamination and decommissioning, and ER activities at SRS. The solid wastes stored or generated at SRS must be treated and disposed of in accordance with federal, state, and local laws and regulations. To evaluate, select, and justify the use of promising treatment technologies and to evaluate the potential impacts to the environment, the generic waste categories described in the Phase I report must be divided into smaller classifications with similar physical, chemical, and radiological characterisics. These classifications, defined as treatability groups, can be used in the WMEIS process to evaluate treatment options. The methodology used to categorize the SRS Solid Waste Streams into treatability groups is based on the premise that the key information ncessary for identifying like treatments can be discerned from the radiological, physical, and chemical properties of the wastes and their contaminants.

7462 (WSRC-RP–94-585) **Thirty-Year Solid Waste Generation Maximum and Minimum Forecast for SRS.** Thomas, L.C. Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1994. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060081. Source: OSTI; NTIS; INIS; GPO Dep.

This report is the third phase (Phase III) of the Thirty-Year Solid Waste Generation Forecast for Facilities at the Savannah River Site (SRS). Phase I of the forecast, Thirty-Year Solid Waste Generation Forecast for Facilities at SRS, forecasts the yearly quantities of low-level waste (LLW), hazardous waste, mixed waste, and transuranic (TRU) wastes generated over the next 30 years by operations, decontamination and decommissioning and environmental restoration (ER) activities at the Savannah River Site. The Phase II report, Thirty-Year Solid Waste Generation Forecast by Treatability Group (U), provides a 30-year forecast by waste treatability group for operations, decontamination and decommissioning, and ER activities. In addition, a 30-year forecast by waste stream has been provided for operations in Appendix A of the Phase II report. The solid wastes stored or generated at SRS must be treated and disposed of in accordance with federal, state, and local laws and regulations. To evaluate, select, and justify the use of promising treatment technologies and to evaluate the potential impact to the environment, the generic waste categories described in the Phase I report were divided into smaller classifications with similar physical, chemical, and radiological characteristics. These smaller classifications, defined within the Phase II report as treatability groups, can then be used in the Waste Management Environmental Impact Statement process to evaluate treatment options. The waste generation forecasts in the Phase II report includes existing waste inventories. Existing waste inventories, which include waste streams from continuing operations and stored wastes from discontinued operations, were not included in the Phase I report. Maximum and minimum forecasts serve as upper and lower boundaries for waste generation. This report provides the maximum and minimum forecast by waste treatability group for operation, decontamination and decommissioning, and ER activities.

7463 (WSRC-TR–94-0494) **Metallurgical Laboratory Hazardous Waste Management Facility groundwater monitoring report. Third quarter, 1994.** Westinghouse Savannah River Co., Aiken, SC (United States). Dec 1994. 383p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005971. Source: OSTI; NTIS; INIS; GPO Dep.

During third quarter 1994, samples from AMB groundwater monitoring wells at the Metallurgical Laboratory Hazardous Waste Management Facility (Met Lab HWMF) were analyzed for selected heavy metals, indicator parameters, radionuclides, volatile organic compounds, and other constituents. Eight parameters exceeded standards during the quarter. As in previous quarters, tetrachloroethylene and trichloroethylene exceeded final Primary Drinking Water Standards (PDWS). Bis(2-ethylhexyl) phthalate exceeded final PDWS in one well. Aluminum, iron, manganese, tin, and total organic halogens exceeded the Savannah River Site (SRS) Flag 2 criteria. Groundwater flow direction and rate in the M-Area Aquifer Zone were similar to previous quarters. Conditions affecting determination of groundwater flow directions and rates in the Upper Lost Lake Aquifer Zone, Lower Lost Lake Aquifer Zone, and the Middle Sand Aquifer Zone of the Crouch Branch Confining Unit were also similar to previous quarters. During second quarter 1994, SRS received South Carolina Department of Health and Environmental Control approval for constructing five point-of-compliance wells and two plume definition wells near the Met Lab HWMF. This project began in July 1994 and is complete; however, analytical data from these wells is not available yet.

7464 (WSRC-TR–94-0539) **Magnetic Survey of the Hydroflouric Acid Spill Area.** Cumbest, R.J. Westinghouse Savannah River Co., Aiken, SC (United States). 4 Nov 1994. 70p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060077. Source: OSTI; NTIS; GPO Dep.

A magnetic survey was conducted at the Hydroflouric Acid Spill Area to evaluate the possibility of buried metal containers or other ferric objects. A proton precession gradiometer with the bottom sensor 2 ft and the top sensor 4 ft from the ground surface was used to sample the survey area on a grid defined by 1 meter grid nodes in a square array. The survey area was surrounded on three sides by a metal fence and metal recycling facility. The fence and metal objects adjacent to the fence, in addition to metal associated with hydrologic monitoring well heads, waste unit marker balls and metal signs caused significant magnetic field and gradient anomalies that extended throughout most of the survey area. In addition to these easily explained anomalies, several anomalies were detected which probably result from buried ferric objects. Some of these anomalies are of limited aerial extent and magnitude and probably represent small shallow objects. However, at least one of the anomalies is of sufficient magnitude and extent that it may represent a large metal container such as a metal drum.

7465 (ANL/EA/CP–82216) **Insights on radiological risks of US Department of Energy radioactive waste management alternatives in the Environmental Management Programmatic Environmental Impact Statement.** Mueller, C. Argonne National Lab., IL (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941142–29: American Society of Mechanical Engineers' winter annual meeting, Chicago, IL (United States), 9-11 Nov 1994). Order Number DE95005865. Source: OSTI; NTIS; INIS; GPO Dep.

A Facility Accident Analysis (1) was performed in support of the US Department of Energy (DOE) Environmental Management (EM) Programmatic Environmental Impact Statement (PEIS). It used an integrated risk-based approach (2) to allow risk comparisons of EM PEIS strategies for consolidating the storage and treatment of wastes at different DOE sites throughout the country. This approach was developed in accordance with the latest National Environmental Protection Act (NEPA) compliance guidance from DOE (3), which calls for consideration of a spectrum of accident scenarios that could occur in implementing the various actions evaluated in the EM PEIS. This paper discusses our insights with respect to the likely importance of the relative treatment technologies, waste management facilities and operations, and waste consolidation strategies considered in the EM PEIS.

7466 (ANL/EA/CP–84292) **Development of risk-based computer models for deriving criteria on residual radioactivity and recycling.** Chen, S.Y. (Argonne National Lab., IL (United States). Environmental Assessment Division). Argonne National Lab., IL (United States). [1994]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9411165–1: 2. EPA/JAERI workshop, Tokai (Japan), 9-11 Nov 1994). Order Number DE95004650. Source: OSTI; NTIS; INIS; GPO Dep.

Argonne National Laboratory (ANL) is developing multimedia environmental pathway and health risk computer models to assess radiological risks to human health and to derive cleanup guidelines for environmental restoration, decommissioning, and recycling activities. These models are based on the existing RESRAD code, although each has a separate design and serves different objectives. Two such codes are RESRAD-BUILD and RESRAD-PROBABILISTIC. The RESRAD code was originally developed to implement the US Department of Energy's (DOE's) residual radioactive materials guidelines for contaminated soils. RESRAD has been successfully used by DOE and its contractors to assess health risks and develop cleanup criteria for several sites selected for cleanup or restoration programs. RESRAD-BUILD analyzes human health risks from radioactive releases during decommissioning or rehabilitation of contaminated buildings. Risks to workers are assessed for dismantling activities; risks to the public are assessed for occupancy. RESRAD-BUILD is based on a room compartmental model analyzing the effects on room air quality of contaminant emission and resuspension (as well as radon emanation), the external radiation pathway, and other exposure pathways. RESRAD-PROBABILISTIC, currently under development, is intended to perform uncertainty analysis for RESRAD by using the Monte Carlo approach based on the Latin-Hypercube sampling scheme. The codes being developed at ANL are tailored to meet a specific objective of human health risk assessment and require specific parameter definition and data gathering. The combined capabilities of these codes satisfy various risk assessment requirements in environmental restoration and remediation activities.

7467 (ANL/EAD/TM–33) **Derivation of uranium residual radioactive material guidelines for the 4400 Piehl Road Site, Ottawa Lake, Michigan.** Faillace, E.; Nimmagadda, M.; Yu, C. Argonne National Lab., IL (United States). Dec 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004186. Source: OSTI; NTIS; INIS; GPO Dep.

Residual radioactive material guidelines for uranium were derived for the 4400 Piehl Road site in Ottawa Lake, Michigan. This site has been designated for remedial action under the Formerly Utilized Sites Remedial Action Program (FUSRAP) of the US Department of Energy (DOE). Single nuclide and total uranium guidelines were derived on the basis of the requirement that the 50-year committed effective dose equivalent to a hypothetical individual who lives or works in the immediate vicinity of the 4400 Piehl Road site should not exceed 30 mrem/yr following remedial action for the current use and plausible future use scenarios. The DOE residual radioactive material guideline computer code, RESRAD, which applies the methodology described in the DOE manual for implementing residual radioactive material guidelines, was used in this evaluation.

7468 (ANL/EWM/CP–83384) **Decontamination and dismantlement of the Argonne National Laboratory-East Map Tube Facility.** Moos, L.P. (Argonne National Lab., IL (United States)); Wescott, J.B.; Fleming, D.L.; Subbaraman, G.; Horton, P. Argonne National Lab., IL (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941196–2: 2. ANS workshop on the safety of Soviet-designed nuclear power plants in conjunction with the winter meeting of the American Nuclear Society, Washington, DC (United States), 12-13 Nov 1994). Order Number DE95004652. Source: OSTI; NTIS; INIS; GPO Dep.

The Map Tube Facility at Argonne National Laboratory-East (ANL-E) was used to temporarily store small, highly radioactive objects and waste materials. The facility contained 129 cast-iron pipes set vertically in a 21 feet deep concrete monolithic structure. Deterioration of the unit allowed water to enter the pipes, carrying radioactive materials into surrounding soil and groundwater. Radioactive sediment and numerous small metallic objects were found in the pipes. Decontamination was undertaken to remove the radioactive water and sediment. The highly radioactive metallic objects were removed and characterized. Residual radioactivity was removed from the structure by removing each pipe from the concrete matrix through a deep concrete coring operation. Each 21 foot long pipe was removed from the concrete matrix as a single unit, lead in two joints in each pipe was removed and the cores were shipped to the DOE Hanford site for disposal. The coring operation successfully removed all residual radioactive material from the structure.

7469 (DOE/DP–0130) **Plutonium Finishing Plant safety evaluation report.** USDOE Assistant Secretary for Defense Programs, Washington, DC (United States). Jan 1995. 292p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006855. Source: OSTI; NTIS; INIS; GPO Dep.

The Plutonium Finishing Plant (PFP) previously known as the Plutonium Process and Storage Facility, or Z-Plant, was built and put into operation in 1949. Since 1949 PFP has been used for various processing missions, including plutonium purification, oxide production, metal production, parts fabrication, plutonium recovery, and the recovery of americium (Am-241). The PFP has also been used for receipt and large scale storage of plutonium scrap and product materials. The PFP Final Safety Analysis Report (FSAR) was prepared by WHC to document the hazards associated with the facility, present safety analyses of potential accident scenarios, and demonstrate the adequacy of safety class structures, systems, and components (SSCs) and operational safety requirements (OSRs) necessary to eliminate, control, or mitigate the identified hazards. Documented in this Safety Evaluation Report (SER) is DOE's independent review and evaluation of the PFP FSAR and the basis for approval of the PFP FSAR. The evaluation is presented in a format that parallels the format of the PFP FSAR. As an aid to the reactor, a list of acronyms has been included at the beginning of this report. The DOE review concluded that the risks associated with conducting plutonium handling, processing, and storage operations within PFP facilities, as described in the PFP FSAR, are acceptable, since the accident safety analyses associated with these activities meet the WHC risk acceptance guidelines and DOE safety goals in SEN-35-91.

7470 (DOE-HDBK–1074-95) **Alternative systematic approaches to training.** USDOE, Washington, DC (United States). Jan 1995. 79p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006851. Source: OSTI; NTIS; GPO Dep.

This handbook is approved for use by all DOE Components and contractors. The handbook was prepared primarily for DOE nuclear facilities, but the information can be effectively used by any other type of facility. DOE nuclear, DOE non-nuclear, commercial nuclear reactor, fuel fabrication, chemical processing, or other types of facilities may also apply the principles of this approach and find it useful and applicable to local needs. The handbook provides DOE and contractor operating organizations with concepts and guidance regarding the use of alternative techniques to implement a systematic approach to training (SAT). The techniques described in this handbook are endorsed by DOE and use of the guidance in this handbook is appropriate for establishment of technical training programs at DOE nuclear facilities. The use of guidance on selection and implementation of appropriate training approaches after consideration of job complexity, the consequences of error based on risk/hazard potential, and available training media should result in effective and efficient training programs. The information presented in this handbook can be used to grade the level of effort and formality used in developing training programs.

7471 (DOE/OR–01-1290-D1) **Third annual environmental restoration monitoring and assessment report for FY 1994 of the Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Clapp, R.B.; Watts, J.A.; Guth, M.A.S. (eds.). Oak Ridge National Lab., TN (United States). Sep 1994. 201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–250). Order Number DE95004745. Source: OSTI; NTIS; INIS; GPO Dep.

ESD Publication 4301.

This report summarizes the salient features of the annual efforts of environmental monitoring, field investigations, and assessments conducted to support the Environmental Restoration (ER) Program at the Oak Ridge National Laboratory (ORNL). This report focuses on the watershed scale, providing an ORNL site-wide perspective on types, distribution, and transport of contamination. The results presented are used to enhance the conceptual understanding of the key contaminants and the sources, fluxes, and processes affecting their distribution and movement. This information forms a basis for prioritizing sites and for selecting, implementing, and evaluating remedial actions. This report summarizes the efforts of the Waste Area Grouping (WAG) 2 and Site Investigations (SI) Project. WAG 2 is the lower portion of the White Oak Creek system which drains the major contaminated sites at ORNL and discharges to the Clinch River where public access is allowed. The Remedial Investigation Plan (DOE 1992) for WAG 2 includes a long-term multimedia environmental monitoring effort that takes advantage of WAG 2's role as an integrator and the major conduit of contaminants from the ORNL site. During FY 1992, the remedial investigation activities were integrated with a series of environmental monitoring and SI activities at ORNL that address pathways and processes important for contaminant movement to gain a more integrated perspective of contamination movement at the watershed scale.

7472 (DOE/RL–94-46) **Environmental Restoration Program technology baseline plan.** Bechtel Hanford, Inc., Richland, WA (United States). Sep 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95004949. Source: OSTI; NTIS; INIS; GPO Dep.

Plutonium production and purification processes at the Hanford Site generated and/or used numerous radioactive and hazardous substances, leaving behind a wide variety of hazardous, radioactive, and mixed wastes in the forms of contaminated soil, groundwater, buried waste, equipment, piping, and structures. Currently, there are at least 1,391 individual waste sites on the Hanford Site. Based on existing characterizations, 174 of the sites contain nonhazardous waste, 134 contain hazardous waste, 133 contain radioactive waste, and 950 contain mixed wastes. These sites are being remediated, decontaminated, and decommissioned by activities within the Hanford Site Environmental Restoration (ER) Program. This document presents a baseline for the many technologies anticipated to perform and support various types of remedial actions. It also discusses a variety of remediation strategies that, in combination, pose a number of technical, economic, and regulatory constraints that affect the selection of individual remediation technologies.

7473 (ES/ER/TM–33/R1) **Approach and strategy for performing ecological risk assessments for the U.S. Department of Energy's Oak Ridge Reservation: 1994 revision.** Suter, G.W. II; Sample, B.E.; Jones, D.S.; Ashwood, T.L. Oak Ridge National Lab., TN (United States). Aug 1994. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004735. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides guidance for planning and performing ecological risk assessments on the Oak Ridge Reservation (ORR). The tiered approach to ecological risk assessment has been implemented, generic conceptual models have been developed, and a general approach for developing ecological assessment endpoints and measurement endpoints has been agreed upon. The document also includes changes in terminology to agree with the terminology in the US Environmental Protection Agency's (EPA's) framework for ecological risk assessment. Although ecological risks are equal in regulatory importance to human health risks, formal procedures for ecological risk assessment are poorly developed. This report will provide specific guidance and promote the use of consistent approaches for ecological risk assessments at individual sites on the ORR. The strategy discussed in this report is consistent with the overall strategy for site management and Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) compliance and with relevant EPA guidance. The general approach and strategy presented herein was developed for the ORR, but it should be applicable to other complex CERCLA sites that possess significant ecological resources.

7474 (ES/ER/TM–113) **Environmental Restoration Information Resource Management Program Plan.** Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). Sep 1994. 69p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004739. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental Restoration Information Resources Management (ER IRM) Program Plan defines program requirements, organizational structures and responsibilities, and work breakdown structure and to establish an approved baseline against which overall progress of the program as well as the effectiveness of its management will be measured. This plan will guide ER IRM Program execution and define the program's essential elements. This plan will be routinely updated to incorporate key decisions and programmatic changes and will serve as the project baseline document. Environmental Restoration Waste Management Program

intersite procedures and work instructions will be developed to facilitate the implementation of this plan.

7475 (FEMP–2396) **Integrated planning: A baseline development perspective.** Clauss, L.; Chang, D. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). 9 Dec 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-941246–6: 2. annual EM cost management conference, San Francisco, CA (United States), 5-9 Dec 1994). Order Number DE95004945. Source: OSTI; NTIS; INIS; GPO Dep.

The FEMP Baseline establishes the basis for integrating environmental activity technical requirements with their cost and schedule elements. The result is a path forward to successfully achieving the FERMCO mission. Specific to cost management, the FEMP Baseline has been incorporate into the FERMCO Project Control System (PCS) to provide a time-phased budget plan against which contractor performance is measured with an earned value management system. The result is the Performance Measurement Baseline (PMB), an important tool for keeping cost under control.

7476 (FEMP–95004724) **Draft final feasibility study report and proposed plan for Operable Unit 4, response to comments: Fernald Environmental Management Project, Fernald, Ohio.** USDOE Fernald Field Office, OH (United States). Feb 1994. 118p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004724. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

This report contains questions and comments regarding a risk evaluation and possible remedial action of Operable Unit 4 at the Feed Materials Production Center at Fernald, Ohio. Attention is focused on the US EPA Region V feasibility study and on the CRARE. The CRARE is a post-remediation time frame document.

7477 (LA–12857-ENV) **Environmental analysis of Lower Pueblo/Lower Los Alamos Canyon, Los Alamos, New Mexico.** Ferenbaugh, R.W.; Buhl, T.E.; Stoker, A.K.; Becker, N.M.; Rodgers, J.C.; Hansen, W.R. Los Alamos National Lab., NM (United States). Dec 1994. 117p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005744. Source: OSTI; NTIS; INIS; GPO Dep.

The radiological survey of the former radioactive waste treatment plant site (TA-45), Acid Canyon, Pueblo Canyon, and Los Alamos Canyon found residual contamination at the site itself and in the channel and banks of Acid, Pueblo, and lower Los Alamos Canyons all the way to the Rio Grande. The largest reservoir of residual radioactivity is in lower Pueblo Canyon, which is on DOE property. However, residual radioactivity does not exceed proposed cleanup criteria in either lower Pueblo or lower Los Alamos Canyons. The three alternatives proposed are (1) to take no action, (2) to construct a sediment trap in lower Pueblo Canyon to prevent further transport of residual radioactivity onto San Ildefonso Indian Pueblo land, and (3) to clean the residual radioactivity from the canyon system. Alternative 2, to cleanup the canyon system, is rejected as a viable alternative. Thousands of truckloads of sediment would have to be removed and disposed of, and this effort is unwarranted by the low levels of contamination present. Residual radioactivity levels, under either present conditions or projected future conditions, will not result in significant radiation doses to persons exposed. Modeling efforts show that future transport activity will not result in any residual radioactivity concentrations higher than those already existing. Thus, although construction of a sediment trap in lower Pueblo Canyon is a viable alternative, this effort also is unwarranted, and the no-action alternative is the preferred alternative.

7478 (LA–12863) **Distributions of 15 elements on 58 absorbers from simulated Hanford Double-Shell Slurry Feed (DSSF).** Marsh, S.F. (Sandia National Labs., Albuquerque, NM (United States)); Svitra, Z.V.; Bowen, S.M. Los Alamos National Lab., NM (United States). Nov 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005652. Source: OSTI; NTIS; INIS; GPO Dep.

As part of the Hanford Tank Waste Remediation System program at Los Alamos, we evaluated 58 commercially available or experimental absorber materials for their ability to remove hazardous components from high-level waste. These absorbers included cation and anion exchange resins, inorganic exchangers, composite absorbers, pillared layered materials, and a series of liquid extractants sorbed on porous support-beads. We tested these absorbers with a solution that simulates Hanford double-shell slurry feed (DSSF) (pH 14.0). To this simulant solution we added the appropriate radionuclides and used gamma spectrometry to measure fission products (Ce, Cs, Sr, Tc, and Y), actinides (U and Am), and matrix elements (Cr, Co, Fe, Mn, Ni, V, Zn, and Zr). For each of 870 element/absorber combinations, we measured distribution coefficients for dynamic contact periods of 30 min, 2 h, and 6 h to obtain information about sorption kinetics. On the basis of these 2610 measured distribution coefficients, we determined that many of the tested absorbers may be suitable for processing DSSF solutions.

7479 (LBL–36212) **The cascade of reservoirs of the "Mayak" Plant: Case history and the first version of a computer simulator.** Mironenko, M.V. (Russian Academy of Sciences, Moscow (Russian Federation). Vernadsky Inst. of Geochemistry and Analytical Chemistry); Spasennykh, M.Yu.; Polyakov, V.B. Lawrence Berkeley Lab., CA (United States). Jul 1994. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95006727. Source: OSTI; NTIS; INIS; GPO Dep.

The improvement of the ecological conditions at waste storing reservoirs is an important task of the restoration activity at Production Association (PA) "Mayak" (South Urals). The radionuclides mostly ^{90}Sr, ^{137}Cs, and chemical pollutants deposited in the reservoir water and in the bottom sediment are very dangerous sources for the contamination of Techa River below the reservoirs and the contamination of groundwater in the surrounding formations. The spreading of radioactive contaminants has both hydrogeological and the chemical features. The thermodynamic approach used to account for physical-chemical interactions between water and the bed rocks based on Gibbs free energy minimization of multicomponent system (H-O-Ca-Mg-K-Na-S-Cl-C-Sr) permitted the authors to calculate the corresponding ionic and complex species existing in the solutions, and to characterize the processes of precipitation and dissolution. The model takes into account the input and output surface and underground water fluxes, mass exchange of the reservoir with the atmosphere, radioactive decay and water-sediment interaction including processes of the ^{90}Sr and ^{137}Cs sorption on the grains of the sediment and the radionuclide diffusion in the pore water. This model was used in the retrospective and prognosis calculations of radiation and hydrochemical regime of these reservoirs.

7480 (LBL-PUB–3040-Rev.) **Level 1: Incidental crane operator's and incidental rigger's manual. Revision.** Neubauer, P. (ed.). Lawrence Berkeley Lab., CA (United States). Nov 1992. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95002358. Source: OSTI; NTIS; GPO Dep.

This document is a safety manual for incidental crane operators and incidental riggers. The information contained in this manual includes: Terminology and definitions, safety orientation, general operating procedures, high-consequence/high value lifts, sling safety, basic rules of hitching and rigging, and common errors in hitching.

7481 (ORNL/ER–169/S3) **WAG 2 remedial investigation and site investigation site-specific work plan/health and safety checklist for the sediment transport modeling task.** Holt, V.L.; Baron, L.A. Oak Ridge National Lab., TN (United States). May 1994. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004733. Source: OSTI; NTIS; INIS; GPO Dep.

This site-specific Work Plan/Health and Safety Checklist (WP/HSC) is a supplement to the general health and safety plan (HASP) for Waste Area Grouping (WAG) 2 remedial investigation and site investigation (WAG 2 RI&SI) activities [Health and Safety Plan for the Remedial Investigation and Site Investigation of Waste Area Grouping 2 at the Oak Ridge National Laboratory, Oak Ridge, Tennessee (ORNL/ER-169)] and provides specific details and requirements for the WAG 2 RI&SI Sediment Transport Modeling Task. This WP/HSC identifies specific site operations, site hazards,

and any recommendations by Oak Ridge National Laboratory (ORNL) health and safety organizations [i.e., Industrial Hygiene (IH), Health Physics (HP), and/or Industrial Safety] that would contribute to the safe completion of the WAG 2 RI&SI. Together, the general HASP for the WAG 2 RI&SI (ORNL/ER-169) and the completed site-specific WP/HSC meet the health and safety planning requirements specified by 29 CFR 1910.120 and the ORNL Hazardous Waste Operations and Emergency Response (HAZWOPER) Program Manual. In addition to the health and safety information provided in the general HASP for the WAG 2 RI&SI, details concerning the site-specific task are elaborated in this site-specific WP/HSC, and both documents, as well as all pertinent procedures referenced therein, will be reviewed by all field personnel prior to beginning operations.

7482 (ORNL/ER–169/S4) **WAG 2 remedial investigation and site investigation site-specific work plan/health and safety checklist for the ecological assessment task, Kingfisher Study.** Holt, V.L.; Baron, L.A. Oak Ridge National Lab., TN (United States). May 1994. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004731. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides specific details and requirements for the WAG 2 remedial investigation and site investigation Ecological Assessment Task, Kingfisher Study, including information that will contribute to safe completion of the project. The report includes historical background; a site map; project organization; task descriptions and hazard evaluations; controls; and monitoring, personal protective equipment, decontamination, and medical surveillance program requirements. The report also includes descriptions of site personnel and their certifications as well as suspected WAG 2 contaminants and their characteristics. The primary objective of the WAG 2 Kingfisher Study is to assess the feasibility of using kingfishers as biological monitors of contaminants on the Oak Ridge Reservation (ORR). Kingfisher sample collection will be used to determine the levels of contaminants and degree of bioaccumulation within a common piscivorous bird feeding on contaminated fish from streams on the ORR.

7483 (ORNL/ER–264) **Data summary for the near-shore sediment characterization task of the Clinch River Environmental Restoration Program.** Levine, D.A.; Hargrove, W.W.; Campbell, K.R.; Wood, M.A.; Rash, C.D. Oak Ridge National Lab., TN (United States). Oct 1994. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004730. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the Near-Shore Sediment Characterization Task of the Clinch River Environmental Restoration Program (CR-ERP). The goals of the task were to (1) determine the extent to which near-shore surface sediments are contaminated by releases from the Oak Ridge Reservation (ORR) and (2) provide data for the Watts Bar Reservoir Interagency Permitting Group (WBRIPG) to evaluate the human health risks from exposure to sediments during and following dredging operations. The data collected for this task are also to be used in the Remedial Investigation/Feasibility Study (RI/FS) for the CR-ERP operable units (Lower Watts Bar and Clinch River) to characterize the human health risk associated with exposure to near-shore sediments throughout the Watts Bar Reservoir.

7484 (ORNL/ER–286) **Technology study of Gunite tank sludge mobilization at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** DeVore, J.R.; Herrick, T.J.; Lott, K.E. Oak Ridge National Lab., TN (United States). Dec 1994. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95005736. Source: OSTI; NTIS; INIS; GPO Dep.

The Oak Ridge National Laboratory (ORNL) Gunite Tank Sludge Mobilization Technology Study was initiated to support the Gunite Tank Treatability Study effort. The technology study surveyed the methods and technologies available for tank cleaning and sludge mobilization in a radioactive environment. Technologies were identified and considered for applicability to the Gunite and Associated Tanks (GAAT) problems. These were then either accepted for further study or rejected as not applicable. Technologies deemed applicable to the GAAT sludge removal project were grouped for evaluation according to (1) deployment method, (2) types of remotely operated end effector equipment applicable to removal of sludge, (3) methods for removing wastes from the tanks, and (4) methods for concrete removal. There were three major groups of deployment technologies: "past practice" technologies, mechanical arm-based technologies, and vehicle-based technologies. The different technologies were then combined into logical sequences of deployment platform, problem, end effector, conveyance, post-removal treatment required (if any), and disposition of the waste. Many waste removal options are available, but the best technology in one set of circumstances at one site might not be the best type to use at a different site. No single technology is capable of treating the entire spectrum of wastes that will be encountered in GAAT. None of the systems used in other industries appears to be suitable, primarily because of the nature of the sludges in the GAAT Operable Unit (OU), their radiation levels, and tank geometries. Other commercial technologies were investigated but rejected because the authors did not believe them to be applicable.

7485 (ORNL/GWPO–012) **Tritium tracer movement as an analogy for pump and treat remediation.** Oak Ridge National Lab., TN (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/M–4039). Order Number DE95005992. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental Sciences Division Publication Number 4370.

There has been debate over effectiveness of groundwater pump and treat remediation. The goal of the following discussion is to present evidence from a tracer test that illustrates the difficulty in removing contaminants from fractured shale that is typical of portions of the DOE-Oak Ridge Reservation (ORR). This report provides a brief prelude to more detailed analysis that is in progress. Attempts to remediate groundwater contamination with pump and treat technology have been hampered by difficulties in removing contaminants in slow flow zones. There is interest in using this remediation method on the ORR because it is an existing technology. However, this setting provides a rather extreme contrast between fast flow zones (fractures) and slow flow zones (the matrix surrounding the fractures). Over the past few years, the authors have begun to develop an understanding of how contaminants move in fractures and how contaminant exchange between the fracture and matrix occurs. In particular, they have evidence from a long term tritium tracer test that has direct bearing on potential success or failure of pump and treat remediation in fractured rocks.

7486 (PNL–10184) **Six-phase soil heating for enhanced removal of contaminants: Volatile organic compounds in non-arid soils integrated demonstration, Savannah River Site.** Gauglitz, P.A. (and others); Bergsman, T.M.; Caley, S.M. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95002856. Source: OSTI; NTIS; INIS; GPO Dep.

In November 1993, Pacific Northwest Laboratory (PNL) and Savannah River Site (SRS) personnel conducted a demonstration of six-phase soil heating (SPSH) at the Savannah River Site (SRS) in Aiken, South Carolina. The demonstration was part of the Volatile Organic Compounds in Non-Arid Soils Integrated Demonstration being conducted near the M-Area operations at the SRS, along a corridor that once contained a process sewer leading to the M-Area seepage basin. In the early 1980s, this sewer line was discovered to be leaking process wastes into the subsurface and contributing to groundwater contamination in the vicinity of M-Area seepage basin. Although use of the sewer line has been discontinued, the slow release of chlorinated solvents such as trichloroethylene (TCE) and perchloroethylene (PCE) from the heterogeneous vadose zone soil continues to be a source of potential groundwater contamination. A significant portion of the VOCs at the demonstration site are retained in low-permeability clay zones. Previous studies have shown that the rate of conventional SVE remediation of the SRS clays is quite slow. The permeability of the clay is of order 10^{-12} cm^2, which makes this a particularly difficult interval to remediate. Thus, the challenge for SPSH is to effectively remediate this clay zone by accelerating the removal of TCE and PCE.

7487 (PNL-SA-23839) **The Environmental and Molecular Sciences Laboratory project – Continuous evolution in leadership.** Knutson, D.E.; McClusky, J.K. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941091–3: 25. Project Management Institute annual seminar and symposium, Vancouver (Canada), 17-19 Oct 1994). Order Number DE95004572. Source: OSTI; NTIS; INIS; GPO Dep.

The Environmental and Molecular Sciences Laboratory (EMSL) construction project at Pacific Northwest Laboratory (PNL) in Richland, Washington, is a $230M Major Systems Acquisition for the US Department of Energy (DOE). The completed laboratory will be a national user facility that provides unparalleled capabilities for scientists involved in environmental molecular science research. This project, approved for construction by the Secretary of Energy in October 1993, is underway. The United States is embarking on an environmental cleanup effort that dwarfs previous scientific enterprise. Using current best available technology, the projected costs of cleaning up the tens of thousands of toxic waste sites, including DOE sites, is estimated to exceed one trillion dollars. The present state of scientific knowledge regarding the effects of exogenous chemicals on human biology is very limited. Long term environmental research at the molecular level is needed to resolve the concerns, and form the building blocks for a structure of cost effective process improvement and regulatory reform.

7488 (SAND–94-1718C) **In situ electrokinetic control of moisture and nutrients in unsaturated soils.** Lindgren, E.R.; Brady, P.V. Sandia National Labs., Albuquerque, NM (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950483–1: 3. international symposium on in situ and on-site bioreclamation, San Diego, CA (United States), 24-27 Apr 1995). Order Number DE95004527. Source: OSTI; NTIS; GPO Dep.

Many DOE facilities have unsaturated soils contaminated with metals and organic solvents. Because of the large volumes, in situ remediation is often the most economically attractive remediation technique. The success of many in situ treatment technologies depends critically on the degree to which the movement of water and desired ions can be engineered in the vadose zone. Bioremediation efforts in the vadose zone are limited by the ability to provide moisture and nutrients to contaminant-metabolizing microorganisms. An in situ electrokinetic remediation process has been developed at Sandia National Laboratories (SNL) for use in unsaturated soils, and is presently undergoing field demonstration. The electrokinetic process is not limited by low soil permeabilities and, therefore, provides a level of control not achievable by hydraulic means. Moisture is added to the subsurface in a controlled fashion such that the field capacity is never exceeded, preventing the unwanted mobilization of dissolved contaminants by saturated wetting fronts. The Sandia electrokinetic process can potentially transport both water and nutrients for bioremediation efforts and is compatible with vapor phase in situ techniques such as bioventing. The approach should as bioventing. The approach should lend itself to the directed transport of biodegradable chelating agents and complexed metals from contaminated soils.

7489 (WHC-EP–0532-Rev.2) **High-heat tank safety issue resolution program plan. Revision 2.** Wang, O.S. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005054. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this program plan is to provide a guide for selecting corrective actions that will mitigate and/or remediate the high-heat waste tank safety issue for single-shell tank 241-C-106. The heat source of approximately 110,000 Btu/hr is the radioactive decay of the stored waste material (primarily ^{90}Sr) inadvertently transferred into the tank in the later 1960s. Currently, forced ventilation, with added water to promote thermal conductivity and evaporation cooling, is used for heat removal. The method is very effective and economical. At this time, the only viable solution identified to permanently resolve this safety issue is the removal of heat-generating waste in the tank. This solution is being aggressively pursued as the only remediation method to this safety issue, and tank 241-C-106 has been selected as the first single-shell tank for retrieval. The current cooling method and other alternatives are addressed in this program as means to mitigate this safety issue before retrieval. This program plan has three parts. The first part establishes program objectives and defines safety issue, drivers, and resolution criteria and strategy. The second part evaluates the high-heat safety issue and its mitigation and remediation methods and other alternatives according to resolution logic. The third part identifies major tasks and alternatives for mitigation and resolution of the safety issue. A table of best-estimate schedules for the key tasks is also included in this program plan.

7490 (WHC-EP–0797) **Cone penetrometer testing at the Hanford Site: Final performance evaluation report.** Richterich, L.R.; Cassem, B.R. Westinghouse Hanford Co., Richland, WA (United States). Aug 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002469. Source: OSTI; NTIS; INIS; GPO Dep.

The Volatile Organic Compounds-Arid Integrated Demonstration (VOC-Arid ID) is one of several US Department of Energy (DOE) integrated demonstrations designed to support the testing of emerging environmental characterization and remediation technologies in support of the Environmental Restoration (ER) and Waste Management (WM) Programs. The primary objective of the VOC Arid ID at the Hanford Site is to characterize, remediate, and monitor arid and semi-arid sites containing volatile organic compounds with or without associated contamination. The main objective of the Arid Drilling Technology Technical Task Plan is to demonstrate promising subsurface access technologies; this includes using the cone penetrometer (CPT) system for source detection, characterization, monitoring, and remediation in support of environmental activities. The utility of the CPT for performing site characterization work has been the subject of much discussion and speculation at the Hanford Site and other arid sites because of the preponderance of thick units of coarse cobbles and gravel in the subsurface.

7491 (WHC-SA–2731) **Virtual reality and stereoscopic telepresence.** Mertens, E.P. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-941249–1: Savings through sharing conference, Washington, DC (United States), 7 Dec 1994). Order Number DE95004787. Source: OSTI; NTIS; INIS; GPO Dep.

Virtual reality technology is commonly thought to have few, if any, applications beyond the national research laboratories, the aerospace industry, and the entertainment world. A team at Westinghouse Hanford Company (WHC) is developing applications for virtual reality technology that make it a practical, viable, portable, and cost-effective business and training tool. The technology transfer is particularly applicable to the waste management industry and has become a tool that can serve the entire work force spectrum, from industrial sites to business offices. For three and a half years, a small team of WHC personnel has been developing an effective and practical method of bringing virtual reality technology to the job site. The applications are practical, the results are repeatable, and the equipment costs are within the range of present-day office machines. That combination can evolve into a competitive advantage for commercial business interests. The WHC team has contained system costs by using commercially available equipment and personal computers to create effective virtual reality work stations for less than $20,000.

7492 (WHC-SD-CP-RPT–012-Rev.1) **Report of clean out and flushing of UO_3 Plant processing equipment: Revision 1.** Gonsalves, E. Westinghouse Hanford Co., Richland, WA (United States). 2 Dec 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004487. Source: OSTI; NTIS; INIS; GPO Dep.

The UO_3 Plant went through a clean out leading to the deactivation of the facility. This clean out consisted of three phases. Phase 1 consisted of the removal of residual process material and the deactivation of most process equipment and instrumentation. Phase 2 consisted of the fixing or removal of contamination so storm water processing would be no longer required. Phase 3 consisted of the remaining activities that had to be completed before the facility was turned over to the Surplus Facility Program. Since the activities of

Phase 2 and 3 were closely related, these two phases were worked simultaneously. The first part of this document summarizes the Phase 1 clean out procedures and their results. Phase 1 was completed on February 28, 1994. The second part summarizes the Phase 2/3 clean out procedures and their results. Phase 2/3 was completed before December 31, 1994. Because tanks and equipment were flushed simultaneously or in a specific sequence, the clean out processes are discussed per workplan.

7493 (WHC-SD-EN-PRS–002) **Summary report of Hanford Site well remediation and decommissioning activities for fiscal year 1994.** Reynolds, K.D. Westinghouse Hanford Co., Richland, WA (United States). 30 Dec 1994. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005629. Source: OSTI; NTIS; INIS; GPO Dep.

Remediation and decommissioning of Hanford Site wells has become an integral part of Hanford Site Environmental Restoration (ER) and Resource Conservation and Recovery Act of 1976 (RCRA) groundwater monitoring programs. A well remediation and decommissioning program was funded and implemented in fiscal year (FY) 1993 under the RCRA and Operational Monitoring (ROM) Program. Funding for this work increased in FY 1994. In FY 1994 well decommissioning activities conducted for the ROM program were centered around the 200 West Area; activities for the ER program were centered in the Fitzner/Eberhart Arid Land Ecology (ALE) (Reserve) unit and the Wahluke Slope (North Slope) area. A total of 116 wells and test borings were decommissioned between the two programs during FY 1994. Additionally, five wells were identified as in need of remediation and were successfully brought into compliance with regulatory requirements. As Hanford Site restoration and remediation efforts increase in scope, the well decommissioning program will remain dynamic. The program will aggressively seek to fulfill the needs of the various environmental cleanup and groundwater/vadose monitoring programs. Wells that do not meet regulatory requirements for preservation will continually be identified and remediated or decommissioned accordingly.

7494 (WHC-SD-GN-TRP–20026) **Load test of the 277W Building high bay roof deck and support structure.** McCoy, R.M. Westinghouse Hanford Co., Richland, WA (United States). 2 Dec 1994. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004492. Source: OSTI; NTIS; INIS; GPO Dep.

The 277W Building high bay roof area was load tested according to the approved load-test procedure, WHC-SD-GN-TP-30015, Revision 1. The 277W Building is located in the 200 West Area of the Hanford Site and has the following characteristics: roof deck – wood decking supported by 4 x 14 timber purlins; roof membrane – tar and gravel; roof slope – flat (<10 deg); and roof elevation – maximum height of about 63 ft. The 227W Building was visited in March 1994 for a visual inspection. During this inspection, cracked areas were visible in the decking, but it was not possible to determine whether these cracks extended completely through the decking, which is 2-in. thick. The building was revisited in March 1994 for the purpose of writing this test report. Because the roof requires personnel access, a test was determined to be the best way to qualify the roof. The conclusions are that the roof has been qualified for 500-lb total roof load and that the "No Roof Access" signs can be changed to "Roof Access Restricted" signs.

7495 (WHC-SD-PRP-HA–014) **T Plant hazards assessment.** Broz, R.E. Westinghouse Hanford Co., Richland, WA (United States). 27 Sep 1994. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004756. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes the technical basis in support of Emergency Planning activities for the T Plant on the Hanford Site. The document represents an acceptable interpretation of the implementing guidance document for DOE ORDER 5500.3A. Through this document, the technical basis for the development of facility specific Emergency Action Levels and the Emergency Planning Zone is demonstrated.

7496 (WHC-SD-SNF-TA–002) **Unreviewed safety question evaluation of 100K East and 100K West in-basin fuel characterization program activities.** Alwardt, L.D. Westinghouse Hanford Co., Richland, WA (United States). 12 Jan 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005645. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to provide the basis for answers to an Unreviewed Safety Question (USQ) safety evaluation of the 105K East (KE) and 105K West (KW) in-basin activities associated with the fuel characterization program as described in the characterization shipping plan. The significant activities that are common to both 105 KE and 105 KW basins are the movement of canisters from their main basin storage locations (or potentially from the 105 KE Tech View Pit if a dump table is available) to the south loadout pit transfer channel, hydrogen generation testing in the single element fuel container, loading the single element fuel container into the shipping cask, loading of the shipping cask onto a flat-bed trailer, return of the test fuel elements or element pieces from the 327 facility, placement of the fuel elements back into Mark 2 canisters, and placement of the canisters in the main storage basin. Decapping of canisters in the south loadout pit transfer channel and re-encapsulation of canisters are activities specific to the 105 KW basin. The scope of this safety evaluation includes only those characterization fuel shipment activities performed in the 105 KE and 105 KW fuel storage basin structures up to installation of the overpack. The packaging safety evaluation report governs the shipment of the fuel elements. The K Basins Plant Review Committee has determined that the in-basin activities associated with the fuel characterization program fuel shipments are bounded by the current safety envelop and do not constitute an unreviewed safety question. This determination is documented on Attachment 1.

7497 (WHC-SD-SNF-TA–003) **Unreviewed safety question evaluation of 100 K West fuel canister gas and liquid sampling.** Alwardt, L.D. Westinghouse Hanford Co., Richland, WA (United States). 12 Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005646. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to provide the basis for answers to an Unreviewed Safety Question (USQ) safety evaluation for the gas and liquid sampling activities associated with the fuel characterization program at the 100 K West (KW) fuel storage basin. The scope of this safety evaluation is limited to the movement of canisters between the main storage basin, weasel pit, and south loadout pit transfer channel (also known as the decapping station); gas and liquid sampling of fuel canisters in the weasel pit; mobile laboratory preliminary sample analysis in or near the 105 KW basin building; and the placement of sample containers in an approved shipping container. It was concluded that the activities and potential accident consequences associated with the gas and liquid sampling of 100 KW fuel canisters are bounded by the current safety basis documents and do not constitute an Unreviewed Safety Question.

7498 (WHC-SD-T100-PMP–001) **Project management plan, Hazardous Materials Management and Emergency Response Training Center.** Borgeson, M.E. Westinghouse Hanford Co., Richland, WA (United States). 12 Dec 1994. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005288. Source: OSTI; NTIS; INIS; GPO Dep.

For the next 30 years, the main activities at the Hanford Site will involve the handling and cleanup of toxic substances. Thousands of workers involved in these new activities will need systematic training appropriate to their tasks and associated risks. This project is an important part of the Hanford Site mission and will enable the US Department of Energy (DOE) to meet high standards for safety. The Hazardous Materials Management and Emergency Response Training Center (HAMMER) project will construct a centralized regional training center dedicated to training hazardous materials workers and emergency responders in classrooms and with hands-on, realistic training aids representing actual field conditions. The HAMMER Training Center will provide a cost-effective, high-quality way to meet the Hanford Site training needs. The training center creates a partnership among DOE; government contractors; labor; local, state, and tribal governments; and selected institutions of higher education.

7499 (WHC-SD-WM-ANAL–039) **242-A Evaporator Condensate Tank (TK-C-100) tie down evaluation.** Hundal, T.S. Westinghouse Hanford Co., Richland, WA (United States). 23 Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005975. Source: OSTI; NTIS; INIS; GPO Dep.

The existing Condensate Tank (TK-C-100) in the 242-A Evaporator building is not anchored to the floor slab. This tank is a Safety Class 3 sitting in a Safety Class 2 building. The tank needed to be evaluated to withstand the seismic loads. Anchor bolts have been designed to hold the tank during the seismic event.

7500 (WHC-SD-WM-DP–080) **45-Day safety screening for Tank 241-C-103 push mode sample, riser 2.** Bell, K.E. Westinghouse Hanford Co., Richland, WA (United States). 16 Dec 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005057. Source: OSTI; NTIS; INIS; GPO Dep.

This is the 45-Day report for the Tank 241-C-103 (C-103) push-mode core sampling characterization effort. Problems encountered with the push-mode sampling truck following removal of the first segment from riser 2 resulted in a long delay before resumption of sampling, therefore it was decided to begin the 45-day clock and issue a report based on receipt of this first segment. If subsequent segments are removed from tank C-103, a revision of this report or a new report will be issued to include any new data. Included are copies of the differential scanning calorimetry (DSC) and thermogravimetric analysis (TGA) scans as requested in Reference 1. Also included is a copy of any immediate notification documentation. Other pertinent documentation will be included in the C-103 216-day report.

7501 (WHC-SD-WM-ER–391) **Rollover analysis of rotary mode core sampler truck No. 2.** Ziada, H.H. Westinghouse Hanford Co., Richland, WA (United States). 8 Nov 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005429. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides estimate of limiting speed and rollover analysis of rotary mode core sampler truck No. 2 (RMCST No. 2).

7502 (WHC-SD-WM-FHA–006) **Fire hazard analysis for the Westinghouse Hanford Company managed low-level mixed waste Trench 31 and 34.** Howard, B.J. Westinghouse Hanford Co., Richland, WA (United States). 10 Jan 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005625. Source: OSTI; NTIS; INIS; GPO Dep.

This analysis is to assess comprehensively the risks from fire within the new lined landfills, provided by W-025 and designated Trench 31 and 34 of Burial Ground 218-W-5; they are located in the 200 West area of the Hanford Site, and are designed to receive low-level mixed waste.

7503 (WSRC-MS–94-0418) **Integration of heterogeneous data bases for development of a large-scale environmental data atlas for multi-platform PC and workstation users.** Bresnaham, P.J. (South Carolina Univ., Columbia, SC (United States)); Cowen, D.J.; Jensen, J.R.; Ehler, G.B.; Mackey, H.E. Jr. Westinghouse Savannah River Co., Aiken, SC (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-9410237–2: 1994 Geographic Information Systems/Land Information Systems (GIS/LIS), Phoenix, AZ (United States), 25-27 Oct 1994). Order Number DE95002689. Source: OSTI; NTIS; INIS; GPO Dep.

Environmental monitoring and restoration at the Department of Energy's Savannah River Site (SRS) requires efficient access to large amounts of diverse spatial data. In order to handle this task the Environmental Sciences Section (ESS) of the Westinghouse Savannah River Company (WSRC) created an environmental data atlas that would use spatial keys to link all data sources to a common data base. These data include extensive information relating to both environmental and man-made features. The data were available in a multitude of different data structures, coordinate systems and formats. The final database also included multimedia information such as airborne multispectral scanner data, aircraft video, photography, bibliographic data, and scanned map bases. It was important that all of the data be readily accessible on the desktop of scientists regardless of the type of computer system they used. The purpose of this paper is to describe the creation of this extensive digital environmental data atlas.

7504 (WSRC-RP–94-01140) **FY94 Office of Technology Development Mixed Waste Operations Robotics Demonstration.** Kriikku, E.M. Westinghouse Savannah River Co., Aiken, SC (United States). 30 Aug 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060078. Source: OSTI; NTIS; INIS; GPO Dep.

The Department of Energy (DOE) Office of Technology Development (OTD) develops technologies to help solve waste management and environmental problems at DOE sites. The OTD includes the Robotics Technology Development Program (RTDP) and the Mixed Waste Integrated Program (MWIP). Together these programs will provide technologies for DOE mixed waste cleanup projects. Mixed waste contains both radioactive and hazardous constituents. DOE sites currently store over 240,000 cubic meters of low level mixed waste and cleanup activities will generate several hundred thousand more cubic meters. Federal and state regulations require that this waste must be processed before final disposal. The OTD RTDP Mixed Waste Operations (MWO) team held several robotic demonstrations at the Savannah River Site (SRS) during November of 1993. Over 330 representatives from DOE, Government Contractors, industry, and universities attended. The MWO team includes: Fernald Environmental Management Project (FEMP), Idaho National Engineering Laboratory (INEL), Lawrence Livermore National Laboratory (LLNL), Oak Ridge National Engineering Laboratory (ORNL), Sandia National Laboratory (SNL), and Savannah River Technology Center (SRTC). SRTC is the lead site for MWO and provides the technical coordinator. The primary demonstration objective was to show that robotic technologies can make DOE waste facilities run better, faster, more cost effective, and safer. To meet the primary objective, the demonstrations successfully showed the following remote waste drum processing activities: non-destructive drum examination, drum transportation, drum opening, removing waste from a drum, characterize and sort waste items, scarify metal waste, and inspect stored drums. To further meet the primary objective, the demonstrations successfully showed the following remote waste box processing activities: swing free crane control, workcell modeling, and torch standoff control.

7505 (WSRC-TR–93-301-Rev.3) **Human Reliability Analysis for In-Tank Precipitation Alignment and Startup of Emergency Purge Ventilation Equipment. Revision 3.** Shapiro, B.J.; Britt, T.E. Westinghouse Savannah River Co., Aiken, SC (United States). Oct 1994. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95060076. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the methodology used for calculating the human error probability for establishing air based ventilation using emergency purge ventilation equipment on In-Tank Precipitation (ITP) processing tanks 48 and 49 after failure of the nitrogen purge system following a seismic event. The analyses were performed according to THERP (Technique for Human Error Rate Prediction) as described in NUREG/CR-1278-F, "Handbook of Human Reliability Analysis with Emphasis on Nuclear Power Plant Applications." The calculated human error probabilities are provided as input to the Fault Tree Analysis for the ITP Nitrogen Purge System.

7506 (WSRC-TR–94-0224-Rev.1) **Tank 41H bounding uranium enrichment. Revision 1.** Cavin, W.S. Westinghouse Savannah River Co., Aiken, SC (United States). 30 Sep 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95005012. Source: OSTI; NTIS; INIS; GPO Dep.

The intent of this document is to combine data from salt samples and historical process information to bound the uranium (U-235) enrichment which could be expected in the upper portion of the salt in Tank 41H. This bounding enrichment will be used in another document to establish a nuclear safety basis for initial salt removal operations. Any number of mixing scenarios could have been examined for the components which fed the evaporator during the

formation of the last five feet of salt. The scenario presented was designed to be conservative, while still incorporating process knowledge and available data where possible. In the scenario, the lowest enrichment seen in any feed material was for the L4 feed which was evaporated to form the top part of the salt in Tank 41H. The lowest enrichment of 17% is still higher than the 16% (95% confidence) maximum enrichment actually found at the salt surface (from sample results). This leads to the conclusion that the uranium enrichment of the material (L1) which was being fed to the evaporate when the last five feet began to form, was lower than 22%. The conservatism used in this analysis, combined with the available sample data are believed to provide a defensible basis for establishing an upper bounding enrichment of 22% for the top five feet of salt.

7507 (WSRC-TR–94-0350) **P-Area Acid/Caustic Basin groundwater monitoring report, second quarter 1994.** Westinghouse Savannah River Co., Aiken, SC (United States). Sep 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95004807. Source: OSTI; NTIS; INIS; GPO Dep.

During second quarter 1994, groundwater from the six PAC monitoring wells at the P-Area Acid/Caustic Basin was analyzed for herbicides/pesticides, radium-226, radium-228, turbidity, and comprehensive constituents. Monitoring results that exceeded the final Primary Drinking Water Standards (PDWS) or the Savannah River Site (SRS) flagging criteria or turbidity standard during the quarter are discussed in this report. During second quarter 1994, no constituents exceeded the final PDWS. Aluminum exceeded its SRS Flag 2 criterion in five PAC wells. Iron and manganese exceeded Flag 2 criteria in three wells, while specific conductance was elevated in one well. Groundwater flow direction and rate in the water table beneath the P-Area Acid/Caustic Basin were similar to past quarters.

7508 (WSRC-TR–94-0524) **Passive control of VOCs using valved well heads: FY1994 report.** Rossabi, J.; Riha, B.D. Westinghouse Savannah River Co., Aiken, SC (United States). 27 Oct 1994. 120p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95004829. Source: OSTI; NTIS; GPO Dep.

The data described in this report were collected as part of a project to explore the viability of passive soil vapor extraction techniques for removal of volatile organic contaminants from the subsurface. The principal objectives of this project are to determine the mechanism and physical dynamics of the relationship between surface atmospheric pressure and subsurface flow and contaminant transport, and to use this information to design cost effective and efficient remediation systems. This work is funded under the Volatile Organic Compounds - Arid Integrated Demonstration (VOC - Arid ID). The purpose of the VOC - Arid ID is to identify, develop, and demonstrate technologies that may be used to characterize, remediate, and/or monitor and or semiarid sites containing VOC (e.g., carbon tetrachloride and trichloroethylene [TCE]) with or without associated metal and radionuclide contamination. The results from this project are applicable at arid, semi-arid, and non-arid sites. This report documents the methods and findings from the Savannah River Site barometric pumping study. The results in this report include: (1) Surface and subsurface pressure measurements and analysis results from the Savannah River Integrated Demonstration Site (SRIDS). (2) Barometric pumping flow data measured and/or estimated from several wells. (3) Continuous concentration and flow data from one well. (4) development of two computer models that can predict either subsurface pressure or the effective cumulative permeability of the formation in the vertical direction from surface atmospheric pressure data. (5) The derivation of the analytical computer models, the executable code on disk, and written documentation for using the models including examples. The optimization of barometric removal rates using an innovative control valve and the implications of this data for passive extraction systems are discussed.

7509 (KAERI/RR–1268/93) **Technology development for nuclear material accountability.** Hong, Jong Sook (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Lee, Byung Doo; Cha, Hong Ryul; Choi, Hyoung Nae; Na, Won Woo; Park, Ho Joon. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 103p. (In Korean). Order Number DE95613319. Source: OSTI; NTIS; INIS.

The objective of this study is to contribute efforts to identifying the characteristics and operation reason of known or clandestine nuclear facility. To achieve this purpose is by means of chemical analysis of various samples from process line and surrounding environment. It is possible to assume that the information of the qualitative and quantitative nuclear activities can be obtained by chemically verifying the various samples discharged from specific nuclear facility. Therefore, these techniques may be helpful to identify the presence of undecleared facilities, to detect the falsified operating data and to verify the accounting data. Am-241 dating method is available to detect the actions to conceal the diversion strategy by falsifying operation data of plutonium production facility. Low level counting systems have been used as environmental monitoring in the neighborhood of nuclear facilities, and it is important to optimize experimental conditions (to reduce system background and to improve detection efficiency) for more accurate measurement. These optimized conditions may be useful in establishing low background counting system and counting room. (Author).

7510 (KAERI/RR–1348/93) **Technology development for nuclear material safeguards -A study on the direct use of spent PWR fuel in CANDU-.** Park, Hyeon Soo (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Hong, Jong Sook; Lee, Byeong Doo; Kim, Ho Dong; Cha, Heung Ryeol; Lee, Yong Deok; Choi, Hyeong Nae; Na, Won Woo; Park, Ho Joon. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 108p. (In Korean). Order Number DE95613320. Source: OSTI; NTIS; INIS.

The research contents of the passed one year were the conceptual design of nuclear material measurement points, of near real time accounting system and of unattended monitoring system for detection of nuclear material diversion. The passive neutron detection system was decided as a proper way of detection of plutonium in the spent fuels and the neutrons emitted by each isotopes were investigated. Also, material balance area and major measurement points were selected and related computer code was used for the near real time accounting in DUPIC facility. (Author).

7511 (SAND–88-0824C) **An overview of technology, equipment and applications.** Miyoshi, D.S. Sandia National Labs., Albuquerque, NM (United States). [1988]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-880580–1: Symposium on gas company security, Chicago, IL (United States), 2 May 1988). Order Number DE88007607. Source: OSTI; NTIS; GPO Dep.

Sandia National Laboratories is the Center of Excellence in Physical Security for the US Department of Energy. Sandia conducts research and development in aspects of physical security concerned with the protection of DOE assets. Sandia provides the focal point for evaluation of new technologies and the conduct of high-risk endeavors on the behalf of the DOE complex. Our work in remote detection technology has been to develop and evaluate a spectrum of tools that can detect the presence of an intruder. A variety of sensors exist that fall into one of the following categories: point sensors, line sensors, and area sensors. These sensors utilize all types of physical phenomena, including seismic and acoustic energy, visible and infrared devices, strain transducers, and electric and magnetic fields. In addition, any system that results in an alarm also requires some types of an assessment system. Closed-circuit TV is most commonly used to assess the causes of alarms, although manual assessment is also used. Development and evaluation of CCTV components are aimed at increasing performance at lower cost and maintenance requirements. in applying technology to security problems, systems aspects should also be considered, such as threat analysis, target analysis, vulnerability assessment, reliability, and operational impact. Security systems can be cost effective if the proper planning has taken place.

7512 (WHC-SD-339-SDR–002-Rev.1) **Vault Safety and Inventory System users manual, PRIME 2350. Revision 1.**

Downey, N.J. Westinghouse Hanford Co., Richland, WA (United States). 14 Dec 1994. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005634. Source: OSTI; NTIS; INIS; GPO Dep.

This revision is issued to request review of the attached document: VSIS User Manual, PRIME 2350, which provides user information for the operation of the VSIS (Vault Safety and Inventory System). It describes operational aspects of Prime 2350 minicomputer and vault data acquisition equipment. It also describes the User's Main Menu and menu functions, including REPORTS. Also, system procedures for the Prime 2350 minicomputer are covered.

7513 (IAEA-TECDOC–766, pp. 95-107) **HM nuclear installation inspectorate's experience of the regulatory control of the storage, handling and transport of civil plutonium in the United Kingdom.** Britten, I.N. (HM Nuclear Installations Inspectorate, Bootle, Merseyside (United Kingdom)). International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310405–: Technical committee meeting on safe handling, transport and storage of plutonium, Vienna (Austria), 18-21 Oct 1993). In *Safe handling, transport and storage of plutonium. Proceedings of a technical committee meeting held in Vienna, 18-21 October 1993.* 120p. Order Number DE95614900. Source: OSTI; NTIS (US Sales Only); INIS.

This paper outlines the way in which regulatory control is exercised over those installations that store, handle and transport civil plutonium in the United Kingdom. It describes some of the difficulties that have arisen in such regulation but concludes that the present arrangements for licensing civil installations provide ample control of the potential dangers associated with increasing quantities of plutonium in circulation. The views expressed are those of the author and other HM Nuclear Installations Inspectors who have been actively involved in the regulatory inspection of licensed plutonium-handling facilities. (author). 1 ref.

7514 (INIS-mf–14429) **Statutory Instruments No 144 of 1994. European Communities (Protection of outside workers from ionising radiation) Regulations, 1994.** Ireland. Apr 1994. 11p. Order Number DE95616224. Source: OSTI; NTIS (US Sales Only); INIS.

These Regulations implement Council Directive 90/641 EURATOM of 4 December, 1990 on the operational protection of outside workers exposed to the risk of ionising radiation during their activities in controlled areas. The Regulations provide for the radiation protection of workers liable to receive an exposure of high radiation levels while working away from their employers' premises. The Regulations also apply to workers who come from, or who go to work in, another Member State of the European Community.

Heavy water is used as moderator and coolant in Pressurized Heavy Water Power Plants. According to the governmental long-term plan for power supply, Korea is scheduled to construct new six pressurized heavy water power plants till the year 2006. Total heavy water demand for these plants would be 3892 Mg during the period 1992-2006. Reformed hydrogen processes are considered best suited to Korea. Hydrophobic catalysts for this process were manufactured and the performance of hydrogen isotope exchance was investigated. The overall mass transfer coefficients varied between 0.004 and 2.295 m^3 HD/m^3 Bed.sec. and heavy water separation processes using the catalysts were optimized. (Author).

Jun 1994. 129p. (In Korean). Order Number DE95612653. Source: OSTI; NTIS; INIS.

The technical and economical feasibility on the polymer catalytic process for the production of heavy water in corporating domestic hydrogen reforming plants (RHEX) were performed. It was suggested to run the RHEX process as a closed system to reduce the loss of concentrated deuterium. As a part of solution to this problem the method of recycling methane gas out of the process and of purifying the water from the hydrogen reforming process have been considered. The controlling factor affecting the unit production cost depends on the cost of polymer catalyst rather than the investment cost. If the catalyst would be produced with the suitable price, the proposed process could be quite competitive comparing with other heavy water production processes. (Author).

To increase the production of RI and labelled compounds utilizing the Korea Multipurpose Research Reactor (KMRR), development of P-32 production process, devices and tools of neutron irradiation use, GMP facilities of radiopharmaceuticals, Dy-165/Ho-166 macroaggregate of radiation synovectomy use for rheumatoid archritis have been carried out, respectively. To utilize NAA in analysis of environmental samples, experimental studies on air borne samples have also been carried out. An efficient P-32 production process obtaining high recovery of >98% with sufficiently high radionuclidic purity of >99% has been established through reaction $^{32}S(n,p)^{32}P$ and subsequent reduced pressure distillation purification. Various capsules, loading/unloading device for capsule/rigs, cole-welder for capsules, checking instrument for capsule sealing, working table/tools, transfer cask for the irradiated targets, etc. have been developed. To maintain cleanliness inside of hot cells, a modification has been proposed, and a two door type autoclave usable in GMP facility has been prepared. An efficient way of preparation of the Dy-165/Ho-166 macroaggregate of radiation synovectomy use as well as its clinical application scheme has been developed. A suitable process of environmental sample analyses has been established by carrying out NAA of standard/reference samples as well as airborne dust samples. (Author).

It is necessary to efficiently manage and operate the irradiation facilities which are used for the various basic and practical application studies as well as for the industrialization of the radiation technology. Dose distribution measurements were carried out to calculate the accurate irradiation dose as our high intensity gamma irradiator was dismantled in Seoul and re-installed in Taejon. The irradiator was operated for the purpose of researches on radiation-related technology and irradiation service after getting approval from KINS. Dose distribution on the irradiation table installed on the northern side of the high intensity gamma irradiator was measured using 137 red acrylic dosimeters and 425 ceric-cerous dosimeters. The data were used for the accurate irradiation of samples. The average dose, standard deviation of dose and deviation rate of dose on the various positions were calculated to identify the variation of dose uniformity caused by the difference in sample size. Our ceric-cerous dosimeter was calibrated through IAEA international dose assurance service. It was reported that our dosimeter showed comparatively low error of -4.05%. On the basis of the results, the correction factor for the dosimeter system could be determined. The high intensity gamma irradiator operated for 290.7 hours for dose distribution measurement, 53.6 hours for test operation, and 7.9 hours for maintenance and checking. The irradiator was operated 31 times to irradiate 17 different kinds of sample from 6 research groups and 3 domestic companies. The low intensity gamma irradiator was designed and its safety against imaginary accident was confirmed by computer analysis.

Radiation-grafting of acrylic acid onto LDPE was carried out by both simultaneous irradiation and pre-irradiation techniques. The effects of metal salts, and sulfuric acid addition, and solvent effect on enhancement of grafting yield were evaluated. The dose distributions of the Co-60 gamma irradiation facility and electron beam accelerator were measured using chemical dosimeters and CTA film dosimeters, respectively. An appropriate base PP was selected, and the effects of addition of various additives on the radiation resistance of the polymer. An air distillation column was examined using a Co-60 source to identify the origin of the malfunction of the column. (Author).

7524 (KFK–5296) **Proceedings of the IEA-workshop on intense neutron sources. IEA-implementing agreement for a programme of research and development on fusion materials. Working group task - annex II.** Ehrlich, K. (ed.); Daum, E. (ed.). Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung; Kernforschungszentrum Karlsruhe GmbH (Germany). The paper analyses in foil form the possibilities for a staged approach in the development of intense neutron sources.

7533 (ORNL--6821) **Advanced Neutron Source (ANS) Project progress report, FY 1994.** Campbell, J.H. (Oak Ridge National Lab., TN (United States)); King-Jones, K.H. (eds.); Selby, D.L.; Harrington, R.M.; Thompson, P.B. Oak Ridge National Lab., TN (United States). Jan 1995. 108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95005923. Source: OSTI; NTIS; INIS; GPO Dep.

The President's budget request for FY 1994 included a construction project for the Advanced Neutron Source (ANS). However, the budget that emerged from the Congress did not, and so activities during this reporting period were limited to continued research and development and to advanced conceptual design. A significant effort was devoted to a study, requested by the US Department of Energy (DOE) and led by Brookhaven National Laboratory, of the performance and cost impacts of reducing the uranium fuel enrichment below the baseline design value of 93%. The study also considered alternative core designs that might mitigate those impacts. The ANS Project proposed a modified core design, with three fuel elements instead of two, that would allow operation with only 50% enriched uranium and use existing fuel technology. The performance penalty would be 15–20% loss of thermal neutron flux; the flux would still just meet the minimum design requirement set by the user community. At the time of this writing, DOE has not established an enrichment level for ANS, but two advisory committees have recommended adopting the new core design, provided the minimum flux requirements are still met.

Order Number DE95615771. Source: OSTI; NTIS (US Sales Only); INIS.

13 fig.

Neutron radiography is a non-destructive testing technique and is being used worldwide for the design and the development of reactor fuels for research and power reactors. It is also being used for non-destructive examination of nuclear industrial products. In addition to its explosives and other industrial sectors. In addition to its applications in industrial sectors, the technique is widely used for research and development activities in biological systems. A review of technical applications of neutron radiography in different fields particularly in nuclear fuel management, aerospace industry, explosives and biology is presented. The methodology of neutron radiography is also discussed in detail along with the advantages of the technique. In addition, the potential of the neutron radiography facility at PINSTECH has been described. (author). 13 fig.

The feasibility study on aceton/2-propanol heat pump system was conducted through experimental systems with the hydrogenation of acetone and the dehydrogenation of 2-propanol. The optimum reaction conditions of hydrogenation and dehydrogenation were determined as follows : For the hydrogenation reaction, Cu-Cr type catalyst showed good activity at the reaction temperature of 150 oC and 4 of the mole ratio of hydrogen and acetone. 5% Ru catalyst based on activated carbon is the best one at the reaction temperature of 83 oC for the dehydrogenation of 2-propanol. 7536 (NYSERDA–94-20) **Hydrogen storage on activated carbon. Final report.** Schwarz, J.A. (Syracuse Univ., NY (United States). Dept. of Chemical Engineering and Materials Science). New York State Energy Research and Development Authority, Albany, NY (United States); Ontario Ministry of Energy, Toronto, ON (Canada); Syracuse Univ., NY (United States). Dept. of Chemical Engineering and Materials Science. Nov 1994. 36p. Sponsored by New York State Energy Research and Development Authority, Albany, NY (United States). Source: OSTI; New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223 (United States).

The project studied factors that influence the ability of carbon to store hydrogen and developed techniques to enhance that ability in naturally occurring and factory-produced commercial carbon materials. During testing of enhanced materials, levels of hydrogen storage were achieved that compare well with conventional forms of energy storage, including lead-acid batteries, gasoline, and diesel fuel. Using the best materials, an electric car with a modern fuel cell to convert the hydrogen directly to electricity would have a range of over 1,000 miles. This assumes that the total allowable weight of the fuel cell and carbon/hydrogen storage system is no greater than the present weight of batteries in an existing electric vehicle. By comparison, gasoline cars generally are limited to about a 450-mile range, and battery-electric cars to 40 to 60 miles. The project also developed a new class of carbon materials, based on polymers and other organic compounds, in which the best hydrogen-storing factors discovered earlier were "molecularly engineered" into the new materials. It is believed that these new molecularly engineered materials are likely to exceed the performance of the naturally occurring and manufactured carbons seen earlier with respect to hydrogen storage.

7538 (SLU-EKOMIL-R–67) **Frost resistance in Salix.** Fircks, H.A. von. Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Ecology and Environmental Research. 1994. 79p. Order Number DE95737677. Source: OSTI; NTIS.

This thesis presents results from a series of studies in various aspects of frost hardiness in Salix viminalis and Salix dasyclados. The seasonal development of frost resistance and the processes which lead to frost damage under different environmental and laboratory test conditions are elucidated, and current methods to evaluate plant response to temperature stress are developed further. A number of phases in the seasonal development of frost resistance can be distinguished, in which the susceptibility of plants to frost ranges from low (dormant stage) to high (growth stage). Changes in phenological characters, ultrastructural cell features, activity of the vascular cambium and storage products (starch, proteins) are correlated with the changes in frost resistance during the annual growth cycle. Differences in relative growth rates imposed by nutrient conditions also affected onset time and rate of frost hardiness development and deacclimation and onset of growth during spring. Dormant stem cutting of various Salix species and clones collected outdoors during winter or subjected to a standardized artificial hardening regime at -4 degrees C survived exposure to at least 85 degrees C. The presence of ice on wintering shoots will restrict freezing avoidance of shoot to above -4 degrees C. Early formation of extracellular ice at -1 degrees C to -4 degrees C, followed by associated high tolerance to freeze-induced dehydration, was concluded to be an important survival mechanism for all winter-dormant Salix plant. Salix species have the inherent ability to develop adequate tolerance to the low winter temperatures in Scandinavian conditions. 304 refs, 8 figs, 11 tabs

7539 (DOE/BP/66088–1) **A handbook for small-scale densified biomass fuel (pellets) manufacturing for local markets.** Folk, R.L.; Govett, R.L. Idaho Univ., Moscow, ID (United States). Coll. of Forestry, Wildlife and Range Sciences. Jul 1992. 143p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-87BP66088. Order Number DE95005618. Source: OSTI; NTIS; GPO Dep.

Wood pellet manufacturing in the Intermountain West is a recently founded and rapidly expanding energy industry for small-scale producers. Within a three-year period, the total number of manufacturers in the region has increased from seven to twelve (Folk et al., 1988). Small-scale industry development is evolving because a supply of raw materials from small and some medium-sized primary and secondary wood processors that has been largely unused. For the residue producer considering pellet fuel manufacturing, the wastewood generated from primary products often carries a cost associated with residue disposal when methods at-e stockpiling, landfilling or incinerating. Regional processors use these methods for a variety of reasons, including the relatively small amounts of residue produced, residue form, mixed residue types, high transportation costs and lack of a local market, convenience and absence of regulation. Direct costs associated with

residue disposal include the expenses required to own and operate residue handling equipment, costs for operating and maintaining a combustor and tipping fees charged to accept wood waste at public landfills. Economic and social costs related to environmental concerns may also be incurred to include local air and water quality degradation from open-air combustion and leachate movement into streams and drinking water.

7540 (KE–93006G) **Process development for energy and compost recovery from biogradable municipal solid waste.** Park, S.C. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Hong, C.J; Lee, J.S.; Lee, J.P. No corporate text available. Dec 1993. 116p. (In Korean). Order Number DE95744263. Source: OSTI; NTIS (US Sales Only).

The goal of this study is to develop a process for energy and compost recovery from anaerobic composting of biogradable MSW and to practical use.The methane yield and anaerobic degradability of bibimbab waste were 471 ml CH4/g VS added and 86% respectively. After digestion, The total solid was reduced by about 90% and 80-90% in batch and continuous experiments respectively. Based on experimental results, mini pilot scale anaerobic digestion system, in which 70L solid-bed reactor for acid fermentation was connected to 200L methane fermentation in series, was constructed. Bioenergy Research Programme.

The Bioenergy Research Programme are: production of wood fuels, peat production, use of bioenergy and conversion of biomass. The most important area of investigation within research on wood fuel production is the development of various methods, machines and systems connected to this area, in order to produce economically competitive fuel. Integrated harvesting appears to have the most promising potential in this area. The central research focuses in peat production research are the utilization of all the peat available in a bog and the development of peat production methods and machines. Development work in this area aims at decreasing of the production costs and also at decreasing of the waste water and other elements of environmental load around the peat production sites. In the long term, the increase of bioenergy in the space heating of small houses and farms, as well as in the production of heat and electricity are the central areas in the use of bioenergy research. The research into the conversion of fuels is concentrated on the production of biomass-based liquid fuels. This publication contains information on research projects in progress in 1994 both in Finnish and in English. The entries have been arranged according to the research field. About 50 projects will be carried out in 1994. The information of public research projects includes the title, the project code, organization, schedule, funding, cooperating organizations and abstract. The joint development and assessment and demonstration projects financed by industry are also listed.

7542 (BNL–52452) **Prospects for pyrolysis technologies in managing municipal, industrial, and DOE cleanup wastes.** Reaven, S.J. (State Univ. of New York, Stony Brook, NY (United States)). Brookhaven National Lab., Upton, NY (United States); State Univ. of New York, Stony Brook, NY (United States). Dec 1994. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95006729. Source: OSTI; NTIS; INIS; GPO Dep.

Pyrolysis converts portions of municipal solid wastes, hazardous wastes, and special wastes such as tires, medical wastes, and even old landfills into solid carbon and a liquid or gaseous hydrocarbon stream. Pyrolysis heats a carbonaceous waste stream typically to 290–900 C in the absence of oxygen, and reduces the volume of waste by 90% and its weight by 75%. The solid carbon char has existing markets as an ingredient in many manufactured goods, and as an adsorbent or filter to sequester certain hazardous wastes. Pyrolytic gases may be burned as fuel by utilities, or liquefied for use as chemical feedstocks, or low-pollution motor vehicle fuels and fuel additives. This report analyzes the potential applications of pyrolysis in the Long Island region and evaluates for the four most promising pyrolytic systems their technological and commercial readiness, their applicability to regional waste management needs, and their conformity with DOE requirements for environmental restoration and waste management. This summary characterizes their engineering performance, environmental effects, costs, product applications, and markets. Because it can effectively treat those wastes that are inadequately addressed by current systems, pyrolysis can play an important complementing role in the region's existing waste management strategy. Its role could be even more significant if the region moves away from existing commitments to incineration and MSW composting. Either way, Long Island could become the center for a pyrolysis-based recovery services industry serving global markets in municipal solid waste treatment and hazardous waste cleanup. 162 refs.

The US Department of Energy (DOE) Alternative Feedstocks (AF) program is forging new links between the agricultural community and the chemicals industry through support of research and development (R & D) that uses 'green' feedstocks to produce chemicals. The program promotes cost-effective industrial use of renewable biomass as feedstocks to manufacture high-volume chemical building blocks. Industrial commercialization of such processes would stimulate the agricultural sector by increasing the demand of agricultural and forestry commodities. New alternatives for American industry may lie in the nation's forests and fields. The national laboratory consortium has undertaken a joint R&D project with the Michigan Biotechnology Institute to demonstrate the feasibility of producing a chemical intermediate, succinic acid, and various derivatives, from renewable agricultural resources.

7544 (DOE/GO–10094-039) **Clean fractionation of biomass.** National Renewable Energy Lab., Golden, CO (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95000259. Source: OSTI; NTIS; GPO Dep.

The US Department of Energy (DOE) Alternative Feedstocks (AF) program is forging new links between the agricultural community and the chemicals industry through support of research and development (R & D) that uses 'green' feedstocks to produce chemicals. The program promotes cost-effective industrial use of renewable biomass as feedstocks to manufacture high-volume chemical building blocks. Industrial commercialization of such processes would stimulate the agricultural sector by increasing the demand of agricultural and forestry commodities. New alternatives for American industry may lie in the nation's forests and fields. The AF program is conducting ongoing research on a clean fractionation process. This project is designed to convert biomass into materials that can be used for chemical processes and products. Clean fractionation separates a single feedstock into individual components cellulose, hemicellulose, and lignin.

7545 (FAAR–23/1993, pp. 92-97) **A laminar entrained flow reactor for the study of aerosol formation and deposition during black liquor combustion and pyrolysis.** Sinquefield, S.A. (Oregon State Univ. Corvallis, OR (United States). Chemical Engineering Dept.); Frederick, W.J.; Mikkanen, P.; Kauppinen, E.I. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

The sub-micron aerosol (fume) particles in kraft recovery boilers play an important role in sulphur capture and control of SO_2 but they also contribute significantly to deposit formation. These deposits reduce heat transfer effectiveness, plug gas passages, and can contribute to corrosion. A two-day shut down for cleaning can

result in over US dollar 500,000 in lost production in a medium sized mill. Recovery boilers built within the last five years, designed specifically to minimize carry-over deposit problems, still experience significant deposition and plugging because of fume deposits. It is therefore fruitful to understand the physical and chemical phenomena in fume particle formation, growth, transport, and deposition if problems with fume deposits are to be controlled or eliminated In pursuit of these goals, a laminar entrained flow reactor (LEFR) has been constructed at the Oregon State University Department of Chemical Engineering. The first experiments with the LEFR were performed in conjunction with the VTT Aerosol Technology Group (ATG) of Finland. The VTT/ATG used a Berner low pressure impactor (BLPI) to carry out size distribution measurements on black liquor (fuel) aerosols resulting from pyrolyzing and combustion conditions. An overview of the LEFR, the BLPI experimental set-up, and the experimental results. Entrained flow reactors have been used for a wide variety of research applications. As of this writing, the authors are aware of no research involving the use of a entrained flow reactor for the study of kraft black liquor.

7546 (GKSS–94/E/31) **Polymer membranes for methane gas treatment.** Bellingen, E.M. Hannover Univ. (Germany). Fakultaet fuer Maschinenwesen; GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Chemie. 1994. 178p. (In German). Order Number DE95738116. Source: OSTI; NTIS (US Sales Only).

Natural- and landfill gases are mainly mixtures of methane, carbon-dioxide and hydrogen-sulfide. In the presence of water the acidic gas components cause corrosion in pipes and installations. Combustion without any separation facilities leads to SO_2-emissions which cause environmental problems. In this thesis different polymer membranes for gas sweetening have been investigated. In order to determine the specific separation properties, investigations with pure gases and gas mixtures were carried out. In order to determine the separation properties under working conditions, test runs were conducted at pressures at up to 70 bar and at temperatures from 5 to 55 C. The results evince a significant influence of the process parameters on the separation process and slow the conception of mathematical model for the determination of the separation properties. These results facilitate the comparison of different membrane systems for various applications and subsequently the best choice of separation process. (orig.)

7547 (KTM/E-B–155) **JALO - Fuel conversion. Final report on the energy research programme 1988-1992.** Sipilae, K. Ministry of Trade and Industry, Helsinki (Finland). Energy Dept. 1994. 112p. Project KTM-100/881/88. Order Number DE95737597. Source: OSTI; NTIS.

JALO Research Programme. Published in Finnish as report KTM/E-B–154.

The Finnish research programme on fuel conversion, JALO, was concerned with thermo-chemical conversion of spent pulping liquors, peat, wood, and industrial residues. The aim of the programme was to develop innovative power plants based on integrated gasification combined-cycle (IGCC). The research activity was carried out within 13 projects and focused, in particular, on fundamentals of thermochemical conversion technologies as well as on laboratory and pilot tests. In addition, development work was carried out within 20 industrial joint-development projects. Experimental and theoretical know-how concerning the new processes was increased significantly and the knowledge was applied in experiments on pressurised gasification pilot rigs. Industrial pilot or demonstration plants are being operated or constructed by Kemira Corporation, A. Ahlstrom Corporation, Imatran Voima Oy and Tampella Power Ltd, and industrial-scale plants are being planned by A. Ahlstrom Corporation, Tampella Power Ltd and Neste Oy. The pressurised test rigs of both the companies and the research institutes are among the first ones of their kind in the world. International research co-operation has been very active within the frameworks of IEA, EU-JOULE and the Nordic Council of Ministers. The next phase of the national energy technology programmes of Ministry of Trade and Industry started from the beginning of 1993 and is scheduled to continue until the end of 1998. Biomass conversion research will be done within BIOENERGY-programme and gasification research within LIEKKI2-programme.

Bench-scale tests with hydro cracking catalysts.** Energiministeriets Forskningsprogram. Anvendelse af biomass til energiformaal. Pedersen, K. Jysk Teknologisk, Aarhus (Denmark). Nov 1989. 41p. (In Danish). Contract EM-1383/88-3. Order Number DE95737585. Source: OSTI; NTIS.

EFP-88.

The purpose of the gas cleaning project is to define the necessary parameters in order to implement decentral, straw-fueled combined heat/power plants with gas cleaning, based on tar cracking.Four catalyst systems for tar decomposition into gaseous components have been tested according to a new gas cleaning method. The catalysts have been tested in temperature interval 350 - 600 deg.C. The cleaning process was carried out under atmospheric pressure. The composition of gas to be cleaned simulated the typical gasification product of straw/air mixture: 12 % hydrogen, 12% carbon oxide, 16 % carbon dioxide, 20 % water vapor, 40 % nitrogen, and 0.03 % hydrogen sulfide. Phenol was added to water in concentration corresponding to 10 g/Nm^3 wet synthesis gas, as this tar component is the most difficult to convert. The catalysts tested were: nickel-molybdenum on alumina, nickel-tungsten on alumina, nickel-tungsten on silica-alumina and palladium on alumina support. Characteristics of these catalysts in form of graphs and numerical values are given. (EG)

7549 (NEI-DK–1806) **Shaft furnace gasification with regard to cogeneration of heat and power. Partial report no. 2: Gasification of straw - test 1-5.** Energiministeriets Forskningsprogram. Anvendelse af biomasse til energiformaal. Zielke, U. Texas Univ., Dallas, TX (United States). Richardson Center for Advanced Studies. Mar 1991. 134p. (In Danish). Contract EM-1383/88-3. Order Number DE95737586. Source: OSTI; NTIS.

EFP-88.

The purpose is to establish an experimental plant in order to modify gasification technology to be used for straw fuel. Low energy gas should be generated to be utilized in an engine. The project is divided into three stages: gasification in shaft- and whole-bale gasifier, gas cleaning and engine operation. This report describes the results of the first tests with a shaft gasifier. In these first 5 tests 42 tons straw were used, the collected operation time was 400 h. There were serious problems with straw-feeding mechanism, resulting in poor quality gas. The gas generator had too low temperature, resulting in frequent coke formation. The maximum calorific value observed was about 7 MJ/m^3. Stirring and improved straw feeding continuity were recommended. (EG)

7550 (NEI-DK–1807) **Shaft furnace gasification with regard to cogeneration of heat and power. Partial report no 5 - Final report. Gasification of wood chips - test 8-9. Gasification of straw - test 10-14.** Energiministeriets Forskningsprogram. Anvendelse af biomasse til energiformaal. Zielke, U. Dansk Teknologisk Inst., Aarhus (Denmark). Miljoeteknik; Voelund R og D Center, Kolding (Denmark). Jun 1994. 62p. (In Danish). Contract EM-1383/88-3. Order Number DE95737588. Source: OSTI; NTIS.

EFP-88.

The original project encompassed shaft furnace gasification of straw, gas cleaning by means of cracking and gas washing, and gas utilization as engine fuel. Additionally experiments with wood chip gasification have been performed. In the straw gasification process a noticeable trend to combustion in the gasifier peripheric region is observed ('Ringfeuer'). Gasification of wood chips is less complicated. The porous structure of the chips provides better transfer of gas and heat, and thereby makes chemical reactions easier. Positive experience with wood chips resulted in establishment of the Voelund gasification plant at Harbooere. The conclusion of the entire project (volumes 1 - 5) is that straw is a difficult material for gasification purposes. However, the process can prove viable and competitive with a specially designed stirrer and an improved air supply, to form a fine-grained and compact pyrolytic layer. (EG)

Zielke, U. Dansk Teknologisk Inst., Aarhus (Denmark). Miljoeteknik; Voelund R og D Center, Kolding (Denmark). Jul 1992. 64p. (In Danish). Contract EM-1383/88-3. Order Number DE95737587. Source: OSTI; NTIS.

Gas produced by thermal conversion of solid fuels always contains some impurities which can be removed by means of washing. The Kyndby combined heat/power plant uses straw as one of possible fuels and tar originating from straw gasification is experimentally removed by means of washing in a two-step gas scrubber. Test no 6 (5 hours altogether) consisted in gas washing under varying pressure. Test no 7 (15 hours altogether) was divided into two periods with gas scrubber cleaning in between. The unsatisfactory results are probably due to clogging of the cooling systems. The degree of gas cooling after passing the cleaning scrubbers is essential for the efficient use of the gas as engine fuel. (EG)

One manure management system provides not only pollution prevention but also converts a manure management problem into a new profit center. Economic evaluations and case studies of operating systems indicate that the anaerobic digestion of livestock manures is a commercially-available bioconversion technology with considerable potential for providing profitable co-products including a cost-effective renewable fuel for livestock production operations. This Casebook examines some of the current opportunities for the recovery of methane from the anaerobic digestion of animal manures. The economic evaluations are based on engineering studies of digesters that generate electricity from the recovered methane. Regression models, which can be used to estimate digester cost and internal rate of return, are developed from the evaluations. Finally, anaerobic digestion has considerable potential beyond agribusiness. Examples of digesters currently employed by other industries are provided.

In the activity 'Utilization of Straw and Similar Agricultural Residues', which is an activity organized under the IEA Bioenergy Agreement, Task X, it was agreed that there is an urgent need for an international harmonization of analytical methods suitable for a general description of straw and straw ash in relation to energy utilization. As a support for the work in the activity, a Round Robin including the most commonly used parameters for straw and straw ash was carried out. The result of this Round Robin combined with the existing experience in the participating countries is the basis for the recommendations in part 1 of this document. At the present state, the recommendations are given for suitable methods in principle, not as detailed prescriptions. In the long view it is, however, the intention, that the recommendations should result in international standards. In the meantime it is expected that comments to the recommendations will be received, and hereby crating a wider basis for working out standard methods in detail. During the work it was recognized that used methods for some of the commonly analysed parameters need a further investigation before it can be decided, whether the methods are suitable for the characterization of biomass for energy utilization. These parameters are discussed in part 2. Furthermore, it was recognized that there is a need for other and more specialized methods for description of problems related to the utilization, such as reactivity, slagging/fouling, and corrosion. In part 3 there is a view over reported alternative methods for the characterization of straw and straw ashes, and in part 4 is listed both finished and on going research and development concerning analysis and characterization of biomass for energy utilization in the participating IEA countries. The present part is part 1. Recommended methods for basic parameters. (EG)

The document 'Analysis of Straw and Straw ashes', part 1-4, September 1994 has been prepared for the IEA - Biomass Utilization Task X. The work has been financed through the Danish Energy Research programme via the project 'International Harmonization of Analytical Methods in the Field of Straw', Energy Research project no. 1323/91-0015. The first draft of the document, of April 1994, was distributed to the countries participating in the activity (Austria, Denmark, The Netherlands, Sweden, and United Kingdom) for comments. On the basis of the received comments, the document has been revised to the final edition of September 1994. The received comments contain several interesting information and points of view, which can be useful for the future work of establishing analytical methods for the characterization of straw and straw ashes. Therefore, it has been decided to work out this compilation of the received comments for a distribution to the participants in the work. To most of the received comments, editorial remarks are given. EFP-93.

In Denmark, straw is applied as a fuel at district heating and combined power and heat generating boiler plants. Straw is by no means a trivial fuel to burn, some of the problems have appeared at boiler plants as high CO-emissions, poor burnout and deposition on the boiler walls. Here a literature study has been conducted, reviewing the combustion and deposition properties of straw. Also a series of interviews have been performed at straw firing plants. The focus of the study has been to investigate, which straw fuel characteristics that may be applied for predicting the combustion and deposition properties of straws. The present investigation will be supplemented with combustion experiments at boiler plants. (au) (9 tabs., 5 ills., 44 refs.)

Aerosol formation mechanism were studied by carrying out aerosol characterisation experiments at a real scale black liquor recovery boiler. The field measurements were carried out in June and November 1992 during intensive experimental periods. During experiments June 1992 black liquor originated from softwood and during experiments November 1992 from softwood and hardwood, respectively.

7560 (SAND–94-8780) **Baseline NO_x emissions during combustion of wood-derived pyrolysis oils.** Baxter, L.; Jenkins, B.; Winter, F. Sandia National Labs., Livermore, CA (United States). Jan 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9409224–1: Biomass pyrolysis oil properties and combustion meeting, Estes Park, CO (United States), 26-28 Sep 1994). Order Number DE95006198. Source: OSTI; NTIS; GPO Dep.

NO_x emissions from two pyrolysis oils of similar origin and overall composition but differing nitrogen contents (0.12 and 0.32% of dry fuel) are determined in a pilot-scale combustor. No NO_x reduction technology is employed in these tests, establishing the baseline or uncontrolled levels of NO_x. Measured effluent oxygen concentrations range from near 0% to near 21%, with stoichiometric ratios ranging from 0 to 1. NO and NO_x are measured separately and found to differ by insignificant (≈10–25 ppmv) amounts. Other relevant gas species (CO_2, CO, total hydrocarbons, and O_2) are also reported. Peak NO_x emissions from these fuels vary from about 300 to around 650 ppmv, with lower levels associated with low nitrogen content fuels. Trends with stoichiometric ratio and fuel nitrogen content agree qualitatively with behavior from other nitrogen containing fuels, including biomass, coal, and petroleum oils. Nitrogen conversion efficiencies as a function of stoichiometric and fuel nitrogen content are observed to decrease with increasing fuel nitrogen content and increase with increasing oxygen content. Measurements of thermal, prompt, and fuel NO_x contributes indicate that fuel NO_x is the dominant formation mechanism for these fuels. These data suggest that NO_x formed during combustion of pyrolysis oil lends itself to many of the same control technologies as are used in other nitrogen-containing fuel.

7561 (NUTEK-R–94-44) **Market conditions for wind power and biofuel-based cogeneration.** Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). Jul 1994. 34p. (In Swedish). Order Number DE95616205. Source: OSTI; NTIS; INIS.

Prepared by Tentum AB for NUTEK.

The aim of this study is to analyze the prerequisites for biofuel-based cogeneration plants and for wind power, with special emphasis on following factors: 1/The effect on the Swedish energy market of the opening of the power transmission networks for free

competition within the electric power supply sector. 2/A market model for the connection between the prices on fossil fuels, biomass fuels, electric power, and heating on the Swedish market. The analysis is made for three scenarios concerning carbon dioxide/energy taxation and the oil price development. The three scenarios are: A. Constant prices on heating oil and coal., B. An internationally uniform carbon dioxide tax, which successively is raised to SEK 0.40 per kilo carbon dioxide to the year 2010. In the year 2005 this will correspond to a doubling of the present prices on crude oil., C. An unilateral Swedish energy- and carbon dioxide tax of todays model (without exception for electric power generation), with constant import prices on heating oil and coal. The decisive factors for bio-cogeneration are construction- and operation costs, the costs of biofuels, and the sales price on electric power and heat. For wind power it is the construction- and operation costs that settle the conditions. 18 figs, 6 tabs.

The study is conducted on six identical test cells roughly of 8000 m^3 each, where the input solid waste is the main varying parameter. The project is planned to run for another three years. The monitoring programme concerns the solid waste in the cells, the biogas and the leachate (quality and quantity). The report presents numbers and graphs over the development of biogas and leachate during the whole period from start up, with emphasis on the last years result. The overall conclusion so far is that we still after five years have a low leachate production (average 72 mm/y), and a high annual biogas production (average 11 m^3 methane gas per tons of dry matter). An increase in the annual leachate production over the last two years was observed. The leachate is rich in organic matter (BOD and COD) and nitrogen. The concentration of heavy metals is generally low. A pronounced seasonal variation in leachate production and quality was observed. The solid waste samples still show relatively high concentrations of VFA. 15 refs, 39 figs and 4 tabs

7563 (DOE/PC/90042–T10) **Development of a catalyst for conversion of syngas-derived materials to isobutylene. Quarterly report number 11, October 1–December 31, 1993.** Barger, P.T. UOP, Inc., Des Plaines, IL (United States). [1993]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90042. Order Number DE95005185. Source: OSTI; NTIS; GPO Dep.

The goals of this project are to develop a catalyst and process for the conversion of syngas to isobutanol. The research will identify and optimize key catalyst and process characteristics. In addition, the commercial potential of the new process will be evaluated by an economic analysis. This report covers three phases of catalyst screening to identify a new catalyst for the production of isoalcohols from syngas or syngas-derived feeds. These phases involve a shift in the project strategy from the direct conversion of CO/H_2 to isoalcohols to a focus on catalysts for the conversion of methanol and, eventually, methanol/ethanol mixtures to higher branched alcohols. The testing of methanol synthesis based catalysts for the conversion of syngas to higher alcohols has been completed this quarter. The three additional catalysts that have been tested (cs modified Cu/Zn/Al oxide, Zn/Cr oxide and Pd/K on Zr/Zn/Mn oxide) have not afforded better selectivity or productivity to isoalcohols than previously tested materials. Considering the low activity that is generally observed for higher alcohols synthesis from syngas suggests that a two stage process combining conventional methanol synthesis with a new process to convert methanol to higher alcohols may be a superior approach to direct synthesis. Therefore, the focus of the research effort at UOP has shifted to the identification of catalysts for the conversion of methanol to higher branched alcohols, particularly isobutanol. A series of mixed metal oxide catalysts based on either conventional methanol synthesis catalysts, the Zr/Zn/Mn oxide catalysts or Mg/Al metal oxide solid solutions (MOSSs) have been evaluated for the conversion of methanol to higher alcohols.

7564 (DOE/PC/90044–10) **High octane ethers from synthesis gas-derived alcohols. Quarterly technical progress report, January–March, 1993.** Klier, K.; Herman, R.G.; Johansson, M.A.; Feeley, O.C. Lehigh Univ., Bethlehem, PA (United States). Apr 1993. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90044. Order Number DE95005303. Source: OSTI; NTIS; GPO Dep.

The objective of the proposed research is to synthesize high octane ethers, primarily methyl isobutyl ether (MIBE) and methyl tertiary butyl ether (MTBE), directly from $H_2/CO/CO_2$ coal-derived synthesis gas via alcohol mixtures that are rich in methanol and 2-methyl-1-propanol (isobutanol). Testing and characterization studies with the 1 wt% sulfate-modified zirconia catalyst that demonstrates high activity and selectivity for dehydration of isobutanol to isobutene from methanol/isobutanol mixtures were continued. It was demonstrated that the secondary isobutanol was dehydrated at a much faster rate than the primary linear alcohols. X-ray photoelectron spectroscopy (XPS) studies were carried out to probe the types of surface acidity on this catalyst. This was accomplished by adsorption of pyridine onto the catalyst and then obtaining the XPS spectrum in the N 1s binding energy region. It was found that both Lewis acid sites and Broensted acid sites were present on the surface of this catalyst, and that most of the acid sites were Broensted acids in character. Similar XPS analyses with γ-alumina after adsorption of pyridine showed the presence of only Lewis acid sites. With the Nafion-H catalyst, which is a sulfonated fluorocarbon resin, the acid sites were of the Broensted acid type. In addition, some physically sorbed pyridine was observed on this sample since it had not been thermally evacuated as the sulfate-modified zirconia catalyst had been.

7565 (DOE/PC/90046–T10) **Heterogeneous catalytic process for alcohol fuels from syngas. Ninth quarterly technical progress report, January 1994–March 1994.** Union Carbide Chemicals and Plastics Co., Inc., South Charleston, WV (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90046. Order Number DE95005558. Source: OSTI; NTIS; GPO Dep.

The principal objectives of this project are to discover and evaluate novel heterogeneous catalysts for conversion of syngas to oxygenates having use as fuel enhancers, to explore novel reactor and process concepts applicable in this process, and to develop the best total process for converting syngas to liquid fuels. The current targets for isobutanol-producing catalysts are to produce an equimolar mixture of methanol and isobutanol with a productivity for isobutanol of > 50 g/Kg-hr. The authors have continued to test their most promising isoalcohol catalyst (a promoted Zn/Cr/Mn spinel oxide). Using temperature and space velocity traverses, they have looked at the effect of conversion on catalyst performance.

7566 (DOE/PC/90046–T11) **Heterogeneous catalytic process for alcohol fuels from syngas. Tenth quarterly technical progress report, April 1994–June 1994.** Union Carbide Corp., South Charleston, WV (United States). [1995]. 10p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC22-91PC90046. Order Number DE95005559. Source: OSTI; NTIS; GPO Dep.

The principal objectives of this project are to discover and evaluate novel heterogeneous catalysts for conversion of syngas to oxygenates having use as fuel enhancers, to explore novel reactor and process concepts applicable in this process, and to develop the best total process for converting syngas to liquid fuels. The current targets for isobutanol-producing catalysts are to produce an equimolar mixture of methanol and isobutanol with a productivity for isobutanol of > 50 g/Kg-hr. The authors have tested one of our most promising isoalcohol catalysts (10-DAN-55, Pd on $ZnCr_2O_4$) at pressures up to 1500 psi and temperatures from 400°C to 450°C at GHSV=6000 and syngas ratio = 1:2.

7567 (DOE/PC/92532–T9) **Fischer-Tropsch synthesis in supercritical reaction media. Quarterly progress report, July 1–September 31, 1994.** Subramaniam, B.; Bochniak, D.; Snavely, K. Kansas Univ., Lawrence, KS (United States). Dept. of Chemical and Petroleum Engineering. Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92532. Order Number DE95005186. Source: OSTI; NTIS; GPO Dep.

The authors commenced investigations of FT reactions with near-critical n-hexane as the reaction medium. Further work was performed on catalyst characterization, including testing a catalyst that has been merely pretreated and catalyst which has also been used in reaction. Successful on-line analysis of FT products in the range was made using the Petrocol DH capillary column. Several analytical problems had to be solved prior to this step however. These problems and their resolutions are described. Preliminary results are included with this report.

7568 (DOE/PC/93213–T4) **Rate inhibition of steam gasification by adsorbed hydrogen. Quarterly technical progress report, July 1–September 30, 1994.** Miller, D.J. Michigan State Univ., East Lansing, MI (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93213. Order Number DE95005188. Source: OSTI; NTIS; GPO Dep.

Progress has been made on several fronts during the fourth quarter of the grant: exhaustive calibration of the gas analysis system, quantitative outgassing experiments, hydrogasification and steam gasification experiments, and ^{1}H-NMR analysis of prepared and annealed carbons have all been completed. Overall, the project has progressed over the past three months from the initial set-up and testing phase to the core experimental phase. The authors have conducted several hydrogen and steam gasification experiments on both as-prepared and annealed Saran char. Production of CO_2 and $CH4_4$ are evident but at a significantly lower rate than CO and H_2. The H_2 formation rate is somewhat higher than the CO formation rate, partially because some carbon is converted to CO_2 or CH_4. But also possibly from the shift reaction or of an inconsistency in calibration.

7569 (KE–93016G) **Study on the production of alternative fuels by carbon dioxide hydrogenation (I).** Sim, K.S. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Son, Y.M.; Kim, J.W.; Kim, Y.S.; Myong, K.S.; Seo, J.M. No corporate text available. Dec 1993. 89p. (In Korean). Order Number DE95744284. Source: OSTI; NTIS (US Sales Only).

The technologies of the separation and recovery of carbon dioxide from exhausted gases which is the most important greenhouse gas, of the fuel production from carbon dioxide by catalytic hydrogenation were surveyed. For the catalytic hydrogenation we made the lab-scale reaction apparatus and carried out some basic experiments with several catalysts like CuO/ZnO/Al203, Raney nickel and other commercial catalysts. (author). refs., figs., tabs.

7570 (ORNL/TM–12849) **Bioprocessing in nonaqueous media - critical needs and opportunities.** Scott, C.D. (Oak Ridge National Lab., TN (United States)); Scott, T.C.; Blanch, H.W.; Klibanov, A.M.; Russell, A.J. Oak Ridge National Lab., TN (United States). Jan 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004878. Source: OSTI; NTIS; GPO Dep.

Chemical conversion processes are pervasive in the U.S. industry. Whether they are used to make intermediate or final products or to remove hazardous materials from process waste streams, they are critical elements in the processing industries. Because of the mild reaction conditions, unique specificity, and selectivity, advanced processing concepts utilizing biocatalytic conversions are now being considered for many industrial uses, including those directly related to energy production and efficiency. Almost all bioprocessing systems currently used by industry utilize the biocatalysts (microorganisms or extracted enzymes) in a "natural" aqueous environment. This has resulted in many important large-scale applications, particularly in the fermentation and pharmaceutical industries. An exciting new area of bioprocessing research is now evolving - the use of biocatalysts in contact with nonaqueous media such as organic liquids or gases, or supercritical fluids. Such approaches could result in additional bioprocessing concepts that would result in a much broader range of utility, especially in energy production and energy-efficient conversion processes in the chemical industry. In fact, a whole new industry may be evolving.

7571 (PNL-SA–24417) **A simulated countercurrent moving-bed chromatographic reactor for the oxidative coupling of methane: Experimental results.** Tonkovich, A.L.Y. (Pacific Northwest Lab., Richland, WA (United States)); Carr, R.W. Pacific Northwest Lab., Richland, WA (United States). Sep 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940920–1: 13. international symposium on chemical reaction engineering, Baltimore, MD (United States), 25 Sep 1994). Order Number DE95004556. Source: OSTI; NTIS; GPO Dep.

The oxidative coupling reaction of methane (OCM) represents a potential commercial ethylene production route. However, the highest reported yields do not exceed 20%. The methane coupling reaction is accompanied by the undesired conversion of methane to carbon oxides. The relative amount of oxygen and methane along with other parameters, including temperature, determine the favored reaction pathway. High hydrocarbon to oxygen feed ratios give high ethane/ethylene selectivities but at the expense of the hydrocarbon conversion. When the methane to oxygen feed ratio is low, combustion is favored. The simulated countercurrent moving-bed chromatographic reactor (SCMCR) is applied to the OCM. A modified experimental configuration is designed and evaluated. A four-section apparatus, each containing a reaction and two separation columns, is used to quickly separate the reactants and products using the principles of simulated countercurrent flow. Simultaneous reaction and separation of the reactive products column is desired, but unattainable because of an incompatibility between OCM reaction and separation temperatures. Microreactor yields with a samarium oxide catalyst gives yields between 2% and 10%. Yields as high as 50% are observed with the same catalyst and run conditions in the SCMCR. These yields are significantly higher than previously reported values. The effects of temperature, feed switching time, and methane to oxygen feed ratio have been investigated. The reactor, while not fully optimized, does give promise as an alternative production method for ethylene.

1020 Products and By-Products

7572 (KE–93019G) **Study of new technology of W/O emulsion for compression ignition diesel engine.** Kwon, C.H. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Kho, C.C.; Lee, Y.J.; Kim, J.P.; Kim, B.S.; Kwon, O.S. No corporate text available. Dec 1993. 137p. (In Korean). Order Number DE95743535. Source: OSTI; NTIS (US Sales Only).

To reduce the exhaust emission of diesel engine, new water-in-oil type emulsion technology was devised. Emulsion fuel was made by only ultrasonic wave (40kHz, 200W), and injected immediately to engine combustion chamber using specially designed apparatus. Surfactant was never used. The experiment results of emulsion fuel are very positive. Experimental engine is 4 cycle, single cylinder compression ignition diesel engine, and its output is 6.5kW. In the case of 30% of water content, specific fuel consumption was reduced by max. 28%, smoke by max. 60%, and CO emission by max. 79%. However, HC emission was getting more serious on the contrary. Micro explosion phenomenom of water-in-oil emulsified

fuel was attributed to a primary factor for the above mentioned positive effects.(author). Refs. and figs.

7573 (DOE/BP/01385–2) **Evaluation of juvenile fish bypass and adult fish passage facilities at water diversions in the Umatilla River. Annual and interim progress report, October 1990–September 1991.** Knapp, S.M. (ed.). Oregon Dept. of Fish and Wildlife, Portland, OR (United States). Jun 1992. 193p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-89BP01385. Order Number DE95004893. Source: OSTI; NTIS; GPO Dep.

We report on our effort from October 1990 through March 1991 to prepare for the evaluation of the juvenile fish bypass facility in the West Extension Irrigation District Canal at Three Mile Falls Dam on the Umatilla River. We also report on our preliminary activities to prepare for future evaluations at Maxwell and Westland diversion dams. A detailed sampling plan was written to guide our efforts in the evaluation process and associated preparatory activities were conducted. In the sampling plan, we developed experimental designs for evaluating the passage of juvenile salmonids through the bypass system including the evaluation at design flow of injury and mortality rates, and passage of juvenile salmonids through and over the screens. We designed and fabricated fish nets for screen leakage tests, and holding facilities for test fish. Modifications to improve evaluation activities were incorporated into the collection facility, and our sampling gear. We designed and fabricated collection systems for the juvenile fish bypass facilities at Maxwell and Westland diversion dams. Preliminary monitoring of system operation was performed at Westland Diversion Dam. We offer recommendations for improving preparations and designs of future evaluations, and also recommend that a detailed evaluation of the Maxwell and Westland juvenile facilities, including evaluation of fish condition and fish passage through or over the screens, be conducted.

7574 (DOE/BP–1953) **Screening analysis, volume 1 description and conclusions, August 1992.** USDOE Bonneville Power Administration, Portland, OR (United States). Aug 1992. 230p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004891. Source: OSTI; NTIS; GPO Dep.

The SOR consists of three analytical phases leading to a Draft EIS. The first phase Pilot Analysis, was performed for the purpose of testing the decision analysis methodology being used in the SOR. The Pilot Analysis is described later in this chapter. The second phase, Screening Analysis, examines all possible operating alternatives using a simplified analytical approach. It is described in detail in this and the next chapter. This document also presents the results of screening. The final phase, Full-Scale Analysis, will be documented in the Draft EIS and is intended to evaluate comprehensively the few, best alternatives arising from the screening analysis. The purpose of screening is to analyze a wide variety of differing ways of operating the Columbia River system to test the reaction of the system to change. The many alternatives considered reflect the range of needs and requirements of the various river users and interests in the Columbia River Basin. While some of the alternatives might be viewed as extreme, the information gained from the analysis is useful in highlighting issues and conflicts in meeting operating objectives. Screening is also intended to develop a broad technical basis for evaluation including regional experts and to begin developing an evaluation capability for each river use that will support full-scale analysis. Finally, screening provides a logical method for examining all possible options and reaching a decision on a few alternatives worthy of full-scale analysis. An organizational structure was developed and staffed to manage and execute the SOR, specifically during the screening phase and the upcoming full-scale analysis phase. The organization involves ten technical work groups, each representing a particular river use. Several other groups exist to oversee or support the efforts of the work groups.

7575 (DOE/BP/22493–8) **Kokanee stock status and contribution of Cabinet Gorge Hatchery, Lake Pend Oreille, Idaho. Final report.** Paragamian, V.L.; Ellis, V.L. Idaho Dept. of Fish and Game, Boise, ID (United States). Fisheries Research Section. Jul 1994. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-85BP22493. Order Number DE95004885. Source: OSTI; NTIS; GPO Dep.

Lake Pend Oreille once provided the most popular kokanee Oncorhynchus nerka fishery in northern Idaho. A dramatic decline in the population occurred from the mid-1960s to 1970s. Restoration efforts included construction of the Cabinet Gorge Fish Hatchery to supplement the wild population and restore the fishery. In this study, hatchery-reared age 0 kokanee were stocked into Lake Pend Oreille from 1986 through 1992. Seven experimental stocking strategies for kokanee were tested using five locations and two time periods (early May through early June or late July). In 1985, the age 3 and older kokanee totaled about 0.35 million, but rose to 0.78 million in 1986, was stable, was then followed by a decline in 1990 to 0.53 million, then improved to 1.75 million in 1992. Much of the annual variation in total numbers of kokanee, ranging from 4.5 million to 10.2 million, was due to hatchery stockings of age 0 fish. Standing stocks of kokanee remained stable and ranged from 8 to 10 kg/hectare despite dramatic changes in density due to age 0 fish. Prior to this study (1985), standing stocks were substantially higher (mean = 13.6 kg/hectare), indicating that the population may be operating below carrying capacity. The authors found survival of age 0 hatchery kokanee by each release season to range from 3% in 1986 to 39% in 1992, while the mean from 1987 through 1992 was 23%. They found significant ($P=0.05$) differences in survival between years, but they could not detect differences between stocking locations ($P>0.71$). Their analysis of survival between time (early vs late) and location was weak and inconclusive because after 1989 they had fewer fish to stock and could not repeat testing of some release strategies. They believe some of the variation in survival between release groups each year was due to the length of time between release in the lake and trawling.

7576 (DOE/BP/23720–21) **Umatilla hatchery monitoring and evaluation. Annual report 1993, September 1, 1992–October 30, 1993.** Keefe, M.L.; Carmichael, R.W.; Focher, S.M.; Groberg, W.J.; Hayes, M.C. Oregon Dept. of Fish and Wildlife, Portland, OR (United States). Jun 1994. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-91BP23720. Order Number DE95003115. Source: OSTI; NTIS; GPO Dep.

The Umatilla Hatchery is the foundation for rehabilitating chinook salmon and enhancing summer steelhead in the Umatilla River and expected to contribute significantly to the Northwest Power Planning Council's goal of doubling salmonid production in the Columbia Basin. This report covers the second year of comprehensive monitoring and evaluation of the Umatilla Hatchery. As both the hatchery and the evaluation study are in the early stages of implementation, much of the information contained in this report is preliminary.

7577 (DOE/BP/91964–3) **Significance of selective predation and development of prey protection measures for juvenile salmonids in the Columbia and Snake River Reservoirs. Annual report, February 1992–February 1993.** Poe, T.P.; Gadomski, D.M. Fish and Wildlife Service, Portland, OR (United States). Columbia River Field Station. Oct 1994. 127p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI79-88BP91964. Order Number DE95004889. Source: OSTI; NTIS; GPO Dep.

This document is the 1992 annual report of progress for the Bonneville Power Administration (BPA) research Project No. 82-003 conducted by the U.S. Fish and Wildlife Service (FWS), the Oregon Cooperative Fishery Research Unit (OCFRU), and the Idaho Cooperative Fish and Wildlife Research Unit (ICFWRU). The

approach was to present the progress achieved during 1992 in a series of separate reports for each major project task. Each report is prepared in the format of a scientific paper and is able to stand alone, whatever the state of progress or completion. Reports 1, 2, and 4 consist of the Abstract only (journal papers were submitted in lieu of reports). This project has two major goals. One is to understand the significance of selective predation and prey vulnerability by determining if substandard juvenile salmonids (dead, injured, stressed, diseased, or naive) are more vulnerable to predation by northern squawfish, Ptychocheilus oregonensis, than standard or normal juvenile salmonids. The second goal is to develop and test prey protection measures to control predation on juvenile salmonids by reducing predator-smolt encounters or predator capture efficiency. Separate abstracts have been submitted to the database for the seven articles in this report.

7578 (DOE/BP/97298–2) **Movements of white sturgeon in Lake Roosevelt. Final report, 1988–1991.** Brannon, E.; Setter, A. Idaho Univ., Moscow, ID (United States). Aquaculture Inst. Jun 1992. 35p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004884. Source: OSTI; NTIS; GPO Dep.

Historically, white sturgeon moved throughout the Columbia River system, ranging freely from the estuary to the headwaters, with the possible exception of limited passage at Cascades, Celilo and Kettle Falls during spring floods. Construction of Rock Island Dam in 1933, followed by Bonneville in 1938 and Grand Coulee in 1941, completely disrupted sturgeon migratory opportunity, and with the 17 successive Columbia and Snake river dams constructed over the next 32 years an entirely different river system was created for the species. Sturgeon caught between dams were essentially isolated populations with severely limited reproduction potential. Some reservoirs ran from dam to dam with no river habitat remaining, while other reaches had various lengths of free running river, but drastically reduced from historical situations. However, if reservoirs provide habitat for sturgeon use, and therefore compensate to some degree for river loss, the major limiting factors associated with population viability may be reduced spawning success, either from lack of suitable area or poor incubation environments. The most upstream impoundment of the Columbia River in the United States is Lake Roosevelt, behind Grand Coulee Dam. If sturgeon don't use Lake Roosevelt the capacity of the system to sustain a large sturgeon population would be understandably limited, and much reduced from the pre-dam era. In general this study found that sturgeon spawner aggregations from early spring to mid- summer depend most heavily on the timing of increasing water temperature. In the spring the water temperatures seem to stimulate the fish to start feeding and leave deep pools. The summer provides access to broader and shallower areas for food. The study on sturgeon movement was an attempt to define habitat use in such a reservoir/river system.

7579 (DOE/EA–0939) **Blue Creek Winter Range: Wildlife Mitigation Project. Final environmental assessment.** USDOE Bonneville Power Administration, Portland, OR (United States); Spokane Indian Tribe, Wellpinit, WA (United States); Bureau of Indian Affairs, Washington, DC (United States). Nov 1994. 59p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). (DOE/BP–2505). Order Number DE95004886. Source: OSTI; NTIS; INIS; GPO Dep.

Bonneville Power Administration (BPA) proposes to fund that portion of the Washington Wildlife Agreement pertaining to the Blue Creek Winter Range Wildlife Mitigation Project (Project) in a cooperative effort with the Spokane Tribe, Upper Columbia United Tribes, and the Bureau of Indian Affairs (BIA). If fully implemented, the proposed action would allow the sponsors to protect and enhance 2,631 habitat units of big game winter range and riparian shrub habitat on 2,185 hectares (5,400 acres) of Spokane Tribal trust lands, and to conduct long term wildlife management activities within the Spokane Indian Reservation project area. This Final Environmental Assessment (EA) examines the potential environmental effects of securing land and conducting wildlife habitat enhancement and long term management activities within the boundaries of the Spokane Indian Reservation. Four proposed activities (habitat protection, habitat enhancement, operation and maintenance, and monitoring and evaluation) are analyzed. The proposed action is intended to meet the need for mitigation of wildlife and wildlife habitat adversely affected by the construction of Grand Coulee Dam and its reservoir.

1308 Health and Safety

7580 (VYH-JULK–A167) **Investigation report of dam safety research in China. Report of hydraulic models.** Qian Mingsen; Wang Lianxiang; Zhang Dong; Yu Minmin; Shi Jun; Reiter, P.; Pyyny, J.; Rytkoenen, T.; Alanko, M. National Board of Waters and Environment, Helsinki (Finland). 1993. 92p. Order Number DE95700207. Source: OSTI; NTIS.

This publication consists of the first and second stages of the Chinese-Finnish Cooperative Research Work on Dam Break Hydrodynamics. It deals with the general situations of dam safety in China. The second part of this report focuses on studies of flow phenomena in dam breach opening.

7581 (VYH-JULK–A167, pp. 3-39) **Investigation report of dam safety research in China.** Qian Mingsen; Wang Lianxiang; Zhang Dong; Yu Minmin; Shi Jun; Reiter, P.; Pyyny, J.; Rytkoenen, T.; Alanko, M. National Board of Waters and Environment, Helsinki (Finland). 1993. In *Chinese-Finnish cooperative research work on dam break hydrodynamics.* 92p. Order Number DE95700207. Source: OSTI; NTIS.

This publication is the first stage report of the Chinese-Finnish Cooperative Research Work on Dam Break Hydrodynamics. It mainly deals with the general situations of dam safety and the experiences in dam break prevention in China. The report includes: 1. General status of reservoir and dam safety problems, 2. Model studies in situ on fuse plug dams, 3. Research on dam break hydrodynamics. The contents in the report might be used as background findings for the cooperation research work, especially for development of a mathematical dam break model, in which the dam break process including overtopping or piping is to be considered.

7582 (VYH-JULK–A167, pp. 41-89) **Chinese-Finnish cooperative research work on dam break hydrodynamics.** Shuibo, Pan; Loukola, E. (eds.); Qian Mingsen; Wang Lianxiang; Zhang Dong; Yu Minmin; Shi Jun; Reiter, P.; Pyyny, J.; Rytkoenen, T.; Alanko, M. National Board of Waters and Environment, Helsinki (Finland). 1993. In *Chinese-Finnish cooperative research work on dam break hydrodynamics.* 92p. Order Number DE95700207. Source: OSTI; NTIS.

This publication is the second stage report of the Chinese-Finnish Cooperative Research Work on Dam Break Hydrodynamics. It mainly focuses on studies of flow phenomena in a dam breach opening and aims at finding the time-average pressure distribution and pressure fluctuation on both the bottom and side surfaces in the dam breach opening, the velocity distribution on transversal cross sections in the breach opening as well as the effects of different upstream and downstream water levels on the above mentioned parameters.

7583 (NREL/TP–411-7472) **Amorphous silicon photovoltaic manufacturing technology - Phase 2A. Annual subcontract report, May 1, 1993–April 30, 1994.** Duran, G. (Utility Power Group, Chatsworth, CA (United States)); Mackamul, K.; Metcalf, D. National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 79p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95000298. Source: OSTI; NTIS; GPO Dep.

Utility Power Group (UPG), and its lower-tier subcontractor, Advanced Photovoltaic Systems, Inc. (APS) have conducted efforts in

developing their manufacturing lines. UPG has focused on the automation of encapsulation and termination processes developed in Phase I. APS has focused on completion of the encapsulation and module design tasks, while continuing the process and quality control and automation projects. The goal is to produce 55 watt (stabilized) EP50 modules in a new facility. In the APS Trenton EUREKA manufacturing facility, APS has: (1) Developed high throughput lamination procedures; (2) Optimized existing module designs; (3) Developed new module designs for architectural applications; (4) Developed enhanced deposition parameter control; (5) Designed equipment required to manufacture new EUREKA modules developed during Phase II; (6) Improved uniformity of thin-film materials deposition; and (7) Improved the stabilized power output of the APS EP50 EUREKA module to 55 watts. In the APS Fairfield EUREKA manufacturing facility, APS has: (1) Introduced the new products developed under Phase I into the APS Fairfield EUREKA module production line; (2) Increased the extent of automation in the production line; (3) Introduced Statistical Process Control to the module production line; and (4) Transferred-progress made in the APS Trenton facility into the APS Fairfield facility.

7584 (NREL/TP–411-7473) **Automated solar cell assembly teamed process research. Semiannual subcontract report, December 6, 1993–June 30, 1994.** Nowlan, M. (Spire Corp., Bedford, MA (United States)). National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95000299. Source: OSTI; NTIS; GPO Dep.

This is the second Semiannual Technical Progress Report for the program titled 'Automated Solar Cell Assembly Teamed Process Research' funded under National Renewable Energy Laboratory (NREL) subcontract No. ZAG-3-11219-01. This report describes the work done on Phase II of the program in the period from December 6, 1993 to June 30, 1994. Spire's objective in this program is to develop high throughput (5 MW/yr) automated processes for interconnecting thin (200 μm) silicon solar cells. High yield will be achieved with these fragile cells through the development of low mechanical stress and low thermal stress processes. For example, a machine vision system is being developed for cell alignment without mechanically contacting the cell edges, while a new soldering process is being developed to solder metal interconnect ribbons simultaneously to a cells' front and back contacts, eliminating one of the two heating steps normally used for soldering each cell.

7585 (NREL/TP–433-7209) **Solar photochemistry - twenty years of progress, what's been accomplished, and where does it lead?.** Blake, D.M. National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004007. Source: OSTI; NTIS; GPO Dep.

It has been more than 20 years since the first oil embargo. That event created an awareness of the need for alternative sources of energy and renewed interest in combining sunlight and chemistry to produce the chemicals and materials required by industry. This paper will review approaches that have been taken, progress that has been made, and give some projections for the near and longer term prospects for commercialization of solar photochemistry.

7586 (NREL/TP–472-7023) **Renewable Energy Demonstration Project by the National Renewable Energy Laboratory and the General Services Administration.** Carlisle, N. (National Renewable Energy Lab., Golden, CO (United States)); Hoo, E.; Westby, R.; Hancock, E.; Lu, J. National Renewable Energy Lab., Golden, CO (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-941218–2: 17. world energy engineering congress and the 4th environmental technology congress and expo, Atlanta, GA (United States), 7-9 Dec 1994). Order Number DE95000261. Source: OSTI; NTIS; GPO Dep.

The Energy Policy Act of 1992 (EPACT) requires the General Services Administration (GSA) to implement a solar energy program to demonstrate and evaluate the performance of available technologies expected to have widespread commercial application. The GSA decided to carry out the project at the Denver Federal Center because of its proximity to the National Renewable Energy Laboratory (NREL). The location was thought to be of mutual benefit to NREL and the GSA: it provides NREL an opportunity to deploy technology and it provides the GSA an opportunity to gain a hands-on learning experience with renewables. The GSA plans to document their experience and use it as a case study in part of a larger training effort on renewable energy. This paper describes the technology selection process and provides an update on the status of the project.

7587 (SAND–94-1546C) **Silicon surface and bulk defect passivation by low temperature PECVD oxides and nitrides.** Chen, Z. (Georgia Institute of Technology, Atlanta, GA (United States). Univ. Center of Excellence for Photovoltaics Research and Education); Rohatgi, A.; Ruby, D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941203–8: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95004531. Source: OSTI; NTIS; GPO Dep.

The effectiveness of PECVD passivation of surface and bulk defects in Si, as well as phosphorous diffused emitters, Is investigated and quantified. Significant hydrogen incorporation coupled with high positive charge density in the PECVD SiN layer is found to play an important role in bulk and surface passivation. It is shown that photo-assisted anneal in a forming gas ambient after PECVD depositions significantly improves the passivation of emitter and bulk defects. PECVD passivation of phosphorous doped emitters and boron doped bare Si surfaces is found to be a strong function of doping concentration. Surface recombination velocity of less than 200 cm/s for 0.2 Ohm-cm and less than 1 cm/s for high resistivity substrates ($\sim$ Ohm-cm) were achieved. PECVD passivation improved bulk lifetime in the range of 30% to 70% in multicrystalline Si materials. However, the degree of the passivation was found to be highly material specific. Depending upon the passivation scheme, emitter saturation current density (J_{oe}) can be reduced by a factor of 3 to 9. Finally, the stability of PECVD oxide/nitride passivation under prolonged UV exposure is established.

7588 (SAND–94-1557C) **A statistical analysis of the effect of PECVD deposition parameters on surface and bulk recombination in silicon solar cells.** Ruby, D.S. (Sandia National Labs., Albuquerque, NM (United States)); Wilbanks, W.L.; Fleddermann, C.B. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941203–16: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95004780. Source: OSTI; NTIS; GPO Dep.

We have performed a statistically designed multiparameter experiment using response surface methodology to determine the optimum deposition and anneal conditions for PECVD silicon-oxide and silicon-nitride films on Si solar cells. Our process includes a unique in situ hydrogen plasma treatment to promote bulk defect passivation independently of surface effects. Our goal has been to define a process to optimize cell performance by minimizing recombination while also providing an effective antireflection coating. Our initial results show that excellent emitter-surface passivation, approaching that of the best thermally grown oxides, can be obtained using a single-layer nitride coating whose refractive index is optimized for antireflection purposes. Use of the PECVD-nitride instead of a TiO_2 ARC resulted in an 11% increase in output power.

7589 (SAND–94-1562C) **Crystalline-silicon photovoltaics: Necessary and sufficient.** Basore, P.A.; Gee, J.M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941203–9: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95004540. Source: OSTI; NTIS; GPO Dep.

Photovoltaic (PV) energy systems have always been dominated by crystalline-silicon (c-Si) technology, and recent developments persuasively suggest that c-Si will continue to be the dominant technology well into the next century. The authors explain why c-Si technology is fairing much better than previously expected, and discuss the impact of improvements currently under development.

They use a ground-up, engineering-based approach to predict the expected evolution of this type of PV system, and argue that c-Si PV will be in a position to compete for the US residential power market starting in about the year 2010. This market alone will provide the opportunity for PV to supply several percent of the electrical energy used in the United States. Crystalline-silicon technology is therefore not just necessary for building a near-term PV industry; it also offers a low-risk approach to meeting long-term goals for PV energy systems.

7590 (SAND–94-1563C) **Extraction of the surface recombination velocity of passivated phosphorus-doped silicon emitters.** Cuevas, A. (Australian National Univ., Canberra, CT (United States). Faculty of Engineering); Giroult-Matlakowski, G.; DuBois, C.; Basore, P.A.; King, R.R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941203–10: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95004539. Source: OSTI; NTIS; GPO Dep.

An analytical procedure to extract the surface recombination velocity of the SiO_2/n type silicon interface, S_p, from PCD measurements of emitter recombination currents is described. The analysis shows that the extracted values of S_p are significantly affected by the assumed material parameters for highly doped silicon, t_p, μ_p and ΔE_g^{app}. Updated values for these parameters are used to obtain the dependence of S_p on the phosphorus concentration, N_D, using both previous and new experimental data. The new evidence supports the finding that S_p increases strongly with N_D.

7591 (SAND–94-1570C) **Reflectance control for multicrystalline-silicon photovoltaic modules using textured-dielectric coatings.** Gee, J.M. (Sandia National Labs., Albuquerque, NM (United States)); Tardy, H.L.; Hund, T.D.; Gordon, R.; Liang, H. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941203–1: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95004532. Source: OSTI; NTIS; GPO Dep.

The authors describe a new approach for controlling the reflectance of photovoltaic modules with planar-surface solar cells. The new approach uses an optically thick, dielectric coating with a large refractive index and a textured surface; this dielectric coating is deposited on the planar-surface solar cell. The textured-dielectric coating works optically with the module encapsulation to promote optical confinement of rays inside the module encapsulation structure, which reduces the net reflectance of the photovoltaic module. The advantage of this approach is that deposition of a textured-dielectric film may be less costly and less intrusive on the cell manufacturing process than texturing multicrystalline-silicon substrates. The authors present detailed optical models and experimental confirmation of the new approach.

7592 (SAND–94-1571C) **The effect of encapsulation on the reflectance of photovoltaic modules using textured multicrystalline-silicon solar cells.** Gee, J.M. (Sandia National Labs., Albuquerque, NM (United States)); Schubert, W.K.; Tardy, H.L.; Hund, T.D.; Robison, G. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941203–15: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95004781. Source: OSTI; NTIS; GPO Dep.

Texturing multicrystalline-silicon cells is a promising technique for reducing reflectance losses. We investigated two methods for texturing multicrystalline-silicon solar cells - anisotropic chemical etch and mechanical dicing saw. Our work emphasized reducing reflectance in the encapsulated module by using optical confinement in the module. We found that optical confinement in the module is very important in the optimization of texture geometries.

7593 (SAND–94-1597C) **GaAsSb-based heterojunction tunnel diodes for tandem solar cell interconnects.** Zolper, J.C.; Klem, J.F.; Plut, T.A.; Tigges, C.P. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941203–13: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95004779. Source: OSTI; NTIS; GPO Dep.

We report a new approach to tunnel junctions that employs a pseudomorphic GaAsSb layer to obtain a band alignment at a InGaAs or InAlAs p-n junction favorable for forward bias tunneling. Since the majority of the band offset between GaAsSb and InGaAs or InAlAs is in the valence band, when an GaAsSb layer is placed at an InGaAs or InAlAs p-n junction the tunneling distance is reduced and the tunneling current is increased. For all doping levels studied, the presence of the GaAsSb-layer enhanced the forward tunneling characteristics. In fact, in a InGaAs/GaAsSb tunnel diode a peak tunneling current sufficient for a 1000 sun intercell interconnect was achieved with $p = 1.5 \times 10^{18}$ cm^{-3} while a similarly doped all-InGaAs diode was rectifying. This approach affords a new degree of freedom in designing tunnel junctions for tandem solar cell interconnects. Previously only doping levels could be varied to control the tunneling properties. Our approach relaxes the doping requirements by employing a GaAsSb-based heterojunction.

7594 (SAND–94-1613C) **Back surface cell structures for reducing recombination in CZ silicon solar cells.** King, R.R. (Siemens Solar Industries, Camarillo, CA (United States)); Mitchell, K.W.; Gee, J.M. Sandia National Labs., Albuquerque, NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941203–19: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95005423. Source: OSTI; NTIS; GPO Dep.

Mass-produced terrestrial CZ silicon solar cells are currently entering the domain in which bulk diffusion length is comparable to the cell thickness, so that recombination at the back surface can have a significant effect on device performance. Three manufacturable processes that address the problem of back recombination are examined here: boron diffusion from a deposited doped SiO_2 layer; Al-alloyed layers using screen-printed paste; and use of a collecting n^+ layer on the back interdigitated with the positive electrode. 104-cm^2 cells fabricated at Siemens Solar Industries using these back surface structures are characterized by current-voltage, spectral response, photoconductivity decay, and SIMS measurements.

7595 (SAND–94-3077C) **Rapid thermal processing of high-efficiency silicon solar cells with controlled in-situ annealing.** Doshi, P. (Georgia Institute of Technology, Atlanta, GA (United States). Univ. Center of Excellence for Photovoltaics Research and Education); Rohatgi, A.; Ropp, M.; Chen, Z.; Ruby, D.; Meier, D.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941203–12: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95004729. Source: OSTI; NTIS; GPO Dep.

Silicon solar cell efficiencies of 17.1%, 16.4%, 14.8%, and 14.9% have been achieved on FZ, Cz, multicrystalline (mc-Si), and dendritic web (DW) silicon, respectively, using simplified, cost-effective rapid thermal processing (RTP). These represent the highest reported efficiencies for solar cells processed with simultaneous front and back diffusion with no conventional high-temperature furnace steps. Appropriate diffusion temperature coupled with the added in-situ anneal resulted in suitable minority-carrier lifetime and diffusion profiles for high-efficiency cells. The cooling rate associated with the in-situ anneal can improve the lifetime and lower the reverse saturation current density (J_0), however, this effect is material and base resistivity specific. PECVD antireflection (AR) coatings provided low reflectance and efficient front surface and bulk defect passivation. Conventional cells fabricated on FZ silicon by furnace diffusions and oxidations gave an efficiency of 18.8% due to greater short wavelength response and lower J_0.

7596 (SAND–94-3078C) **Recent progress in the Photovoltaic Manufacturing Technology Project (PVMaT).** Witt, C.E. (National Renewable Energy Lab., Golden, CO (United States)); Mitchell, R.L.; Thomas, H.; Ruby, D.; Herwig, L.O.; Sellers, R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC04-94AL85000. (CONF-941203–14: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95004782. Source: OSTI; NTIS; GPO Dep.

The Photovoltaic Manufacturing Technology (PVMaT) Project was initiated in 1990 to help the U.S. photovoltaic (PV) industry extend its world leadership role in manufacturing and commercially developing PV modules and systems. It is being conducted in several phases, staggered to support industry progress. The four most recently awarded subcontracts (Phase 2B) are now completing their first year of research. They include two subcontracts in CdTe, one on Spheral Solar™ Cells, and one on cast polysilicon. These subcontracts represent new technology additions to the PVMaT Project. Subcontracts initiated in earlier phases are nearing completion, and their progress is summarized. An additional phase of PVMaT, Phase 4A, is being initiated which will emphasize product-driven manufacturing research and development. The intention of Phase 4A is to emphasize improvement and cost reduction in the manufacture of full-system PV products. The work areas may include, but not limited to, issues such as improvement of module manufacturing processes; system and system component packaging, integration, manufacturing, and balance-of-system development with the goal of product manufacturing improvements.

1406 Photovoltaic Power Systems

7597 (Juel–2855) **Environmental impact statements in research projects. The example of photovoltaic energy conversion. Vol. 1. Summary and results.** Angewandte Systemanalyse, v. 67. Hirtz, W.; Huber, W.; Kolb, G. Forschungszentrum Juelich GmbH (Germany). Programmgruppe Systemforschung und Technologische Entwicklung. Dec 1993. 212p. (In German). Order Number DE95738824. Source: OSTI; NTIS (US Sales Only).

A methodology was developed by which the impact of new technical developments on humans and the environment can be assessed already in the early stages of research. The procedure comprises several stages: Orientation phase, implementation and evaluation phase, validation phase. The procedure was tested for the example of photovoltaic energy conversion. The report describes the for preparation of industrial-quality silicum and of monocrystalline, multicrystalline, and amorphous cells and modules, each with a list of basic materials and emissions. (BWI)

7598 (NREL/TP–411-7402) **Technical evaluation of a dual-junction same-band-gap amorphous silicon photovoltaic system at NREL.** Strand, T.; Mrig, L.; Hansen, R.; Emery, K. National Renewable Energy Lab., Golden, CO (United States). Dec 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-941203–17: 1. world conference on photovoltaic energy conversion, Waikoloa, HI (United States), 5-9 Dec 1994). Order Number DE95000277. Source: OSTI; NTIS; GPO Dep.

On December 7, 1992, a 1.8-kW_{ac} utility-interconnect photovoltaic (PV) system using amorphous silicon modules was brought on-line at the National Renewable Energy Laboratory's photovoltaic test site. This system was deployed to conduct an in-situ technical evaluation of the PV array (in a high voltage configuration) and system performance and reliability in a utility-interconnect application. The system is unique due to the installation of construction-grade insulation on the back of each PV module. This use of insulation is an attempt to levelize the annual array power output by elevating the operating temperature of the modules. This paper presents array and system performance data. Emphasis is placed on quantifying the effects of individual losses as well as seasonal changes on PV array and system performance.

1407 Solar Thermal Power Systems

7599 (NREL/TP–471-7296) **Comparison of three methods for optical characterization of point-focus concentrators.** Wendelin, T.J. (National Renewable Energy Lab., Golden, CO (United States)); Grossman, J.W. National Renewable Energy Lab., Golden, CO (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-950336–18: American Society of Mechanical Engineers/Japanese Society of Mechanical Engineers/Japan Solar Energy Society international solar energy conference, Maui, HI (United States), 19-24 Mar 1995). Order Number DE95000282. Source: OSTI; NTIS; GPO Dep.

Three different methods for characterizing point-focus solar concentrator optical performance have been developed for specific applications. These methods include a laser ray trace technique called the Scanning Hartmann Optical Test, a video imaging process called the 2f Test, and on-sun testing in conjunction with optical computer modeling. Three concentrator test articles, each of a different design, were characterized using at least two of the methods and, in one case, all three. The results of these test are compared. Excellent agreement was observed in the results, suggesting that the techniques provide consistent and accurate characterizations of solar concentrator optics.

7600 (PNL–10222) **Simulation of diurnal thermal energy storage systems: Preliminary results.** Katipamula, S. (Pacific Northwest Lab., Richland, WA (United States)); Somasundaram, S.; Williams, H.R. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005751. Source: OSTI; NTIS; GPO Dep.

This report describes the results of a simulation of thermal energy storage (TES) integrated with a simple-cycle gas turbine cogeneration system. Integrating TES with cogeneration can serve the electrical and thermal loads independently while firing all fuel in the gas turbine. The detailed engineering and economic feasibility of diurnal TES systems integrated with cogeneration systems has been described in two previous PNL reports. The objective of this study was to lay the ground work for optimization of the TES system designs using a simulation tool called TRNSYS (TRaNsient SYstem Simulation). TRNSYS is a transient simulation program with a sequential-modular structure developed at the Solar Energy Laboratory, University of Wisconsin-Madison. The two TES systems selected for the base-case simulations were: (1) a one-tank storage model to represent the oil/rock TES system, and (2) a two-tank storage model to represent the molten nitrate salt TES system. Results of the study clearly indicate that an engineering optimization of the TES system using TRNSYS is possible. The one-tank stratified oil/rock storage model described here is a good starting point for parametric studies of a TES system. Further developments to the TRNSYS library of available models (economizer, evaporator, gas turbine, etc.) are recommended so that the phase-change processes is accurately treated.

7603 (DTU-LV-MEDD–264) **Improvement of effect of a solar heating system.** Kristiansen, F.; Oestergaard Jensen, S. Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varmeisolering. Sep 1994. 84p. (In Danish). Contract ENS-51181-93.0020. Order Number DE95737562. Source: OSTI; NTIS.

This report describes an investigation of the increase in performance for a solar heating system through use of combined air/liquid collectors instead of the usual liquid collectors. The efficiency of two different air/liquid collectors was measured under standard conditions in the solar simulator at the Thermal Insulation Laboratory, and different types of efficiency formulas were derived. One of the collectors was a commercial product from the manufacturer Aidt Miljoe, and the other was a prototype of the so-called MF/AW-collector (Multi-Function/Air-Water-collector). During the tests it was found that the air section of the MF/AW-collector was rather leaky so that a substantial part of the air bypassed the absorber. Thus the collector showed much lower efficiency than expected, and decreasing efficiency at increasing air flow rates. Based on the efficiency test, computer simulations of the performance of solar systems with the two collector types have been carried out, with two different programs. Combined systems with 5 m^2 solar collectors for one-family houses were investigated and compared with a similar system with normal liquid collectors. None of the simulation programs developed so far can handle combined air/liquid systems correctly, and it was therefore necessary to make a number of simplifying assumptions regarding the operation and control of the solar system in order to carry out the simulations. The different simplifications leading to different estimates of the performance have been compared and discussed in the report. (au)

1420 Heat Storage

7604 (IKE-5–240) **Theoretical and experimental investigation of a high-temperature latent heat storage system with a salt ceramic composite as storage medium.** Kim, Soo Kyung. Stuttgart Univ. (Germany). Inst. fuer Kernenergetik und Energiesysteme. Aug 1994. 98p. (In German). Order Number DE95738270. Source: OSTI; NTIS (US Sales Only).

In this paper a theoretical and experimental investigation of the transient thermal behavior of a heat storage system is presented. A composite salt/ceramic material is employed as a Thermal Energy Storage (TES) medium with the aim to recover industrial waste heat. The TES medium consists of a solid micro-porous structure of a ceramic matrix, the pores of which are filled with salt. The salt undergoes a phase change at the melting temperature or over a temperature interval, where its latent heat is stored or released. The sensible heat of both the ceramic matrix and the salt can be utilized in a wide temperature range, depending on the specific operating conditions of the store. The molten salt is retained within the pores of the ceramic matrix by capillary forces, which makes the direct-contact heat exchange between the TES medium and the Heat Transfer Fluid (HTF) possible. The theoretical investigation of the TES system is based on a numerical approach. The energy conservation equation for the TES medium is expressed three-dimensional in rectangular coordinates, to take into account the effects of heat losses to the surroundings and the local variation of the HTF inlet boundary conditions. The equation is formulated with the enthalpy method. For better accounting of the real case, the energy equation for the storage container wall is also considered. The energy equations are discretized by the control volume method and the resulting difference equations are solved by an explicit finite difference method applying the Heun's predictor-corrector method. For modelling the storage unit, lumped elements interacting with the HTF and also shape factors and lumped heat transfer coefficients are introduced. Because of the nonlinearity of the equations due to the temperature dependent thermophysical properties, an interactive scheme is used for the solution. (orig.)

15 GEOTHERMAL ENERGY

1502 Geology and Hydrology of Geothermal Systems

7605 (LBL–36208) **Seismic monitoring at the Geysers Geothermal Field.** Romero, A.E. Jr.; Kirkpatrick, A.; Majer, E.L.; Peterson, J.E. Jr. Lawrence Berkeley Lab., CA (United States). Sep 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-941043–6: 1994 annual meeting of the Geothermal Resources Council: restructuring the geothermal industry, Salt Lake City, UT (United States), 2-5 Oct 1994). Order Number DE95004672. Source: OSTI; NTIS; GPO Dep.

This report summarizes the efforts of LBL to utilize MEQ data in reservoir definition as well as in evaluating its performance. Results of the study indicate that the velocity and attenuation variations correlate with the known geology of the field. At the NW Geysers, high velocity anomalies correspond to metagraywacke and greenstone units while low velocity anomalies seem to be associated with Franciscan melanges. Low Vp/Vs and high attenuation delineate the steam reservoir suggesting undersaturation of the reservoir rocks. Ongoing monitoring of Vp/Vs may be useful in tracking the expansion of the steam zone with time. Spatial and temporal patterns of seismicity exhibit compelling correlation with geothermal exploitation. Clusters of MEQs occur beneath active injection wells and appear to shift with changing injection activities. High resolution MEQ locations hold promise for inferring fluid flow paths, especially in tracking injectate. This study has demonstrated that continuous seismic monitoring may be useful as an active reservoir management tool.

1503 Geothermal Exploration and Exploration Technology

7606 (DOE/ER/14217–2) **Transport in porous and fractured media of the Creede Formation.** Conca, J.L. Washington State Univ., Richland, WA (United States). [1995]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG06-91ER14217. Order Number DE95004260. Source: OSTI; NTIS; GPO Dep.

Direct measurement was made of the hydraulic conductivity of Creede Formation rocks using a new experimental method. The UFA™ method employs open-flow centrifugation. Centrifugation, like gravity, has the effect on a material of a whole-body force exerting equal force at all points within the sample. The equivalent gravitational force exerted throughout the sample can be chosen to be from one to four orders of magnitude higher than earth gravity (from 10 to 10,000 g). The result is an increase in rate of fluid flow equally at all points throughout the sample so that hydraulic steady state is obtained in most geologic materials in hours, even under highly unsaturated conditions. This extraordinarily short time allows direct measurement of transport parameters, such as hydraulic conductivity, diffusion coefficient, and retardation factors, in any porous media over the complete range of field moisture contents. Hydraulic conductivities in the Creede Formation rocks ranged from 10^{-12} cm/s to 10^{-7} cm/s (10^{-9} Darcy to 10^{-4} Darcy) and showed no correlation with any other physical or mineralogical properties including porosity. The high degree of alteration to clay minerals appears to obscure any porosity/permeability relationship of the kind that occurs in many reservoir rocks. However, down-hole neutron porosities correlated well with laboratory-determined porosities. The objective of this investigation is to determine the hydrologic transport parameters of Creede Formation rocks for use in transport model development and for image analysis of transport pathways to produce a porosity/permeability evolution curve in support of geochemical and isotopic water/rock interaction models.

1505 Economic, Industrial, and Business Aspects

7607 (DOE/GO–10094-005) **Geothermal Program Review 12: Geothermal Energy and the President's Climate Change**

Action Plan. USDOE Assistant Secretary for Conservation and Renewable Energy, Washington, DC (United States). Geothermal Div. [1994]. 289p. Sponsored by USDOE, Washington, DC (United States). (CONF-9404102–: 12. geothermal program review: geothermal's role in global climate change - impacts on the Climate Change Action Plan, San Francisco, CA (United States), 25-28 Apr 1994). Order Number DE94011892. Source: OSTI; NTIS; GPO Dep.

Geothermal Program Review XII, sponsored by the Geothermal Division of US Department of Energy, was held April 25–28, 1994, in San Francisco, California. This annual conference is designed to promote effective technology transfer by bringing together DOE-sponsored researchers; utility representatives; geothermal energy developers; suppliers of geothermal goods and services; representatives from federal, state, and local agencies; and others with an interest in geothermal energy. In-depth reviews of the latest technological advancements and research results are presented during the conference with emphasis on those topics considered to have the greatest potential to impact the near-term commercial development of geothermal energy.

1508 Geothermal Power Plants

7608 (EGG-M–94185) **Field investigations examining the impact of supersaturated vapor expansions on turbine performance.** Mines, G.L. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. (CONF-9404102–8: 12. geothermal program review: geothermal's role in global climate change - impacts on the Climate Change Action Plan, San Francisco, CA (United States), 25-28 Apr 1994). Order Number DE95005000. Source: OSTI; NTIS; GPO Dep.

Investigators in the Heat Cycle Research project are developing a technology base which will permit the increased utilization of the moderate-temperature, liquid-dominated geothermal resource for the production of electrical power. The project investigations have focused upon power cycles which have the potential for the increased utilization (power produced per unit quantity of fluid) of the hydrothermal resource. The investigations to date have confirmed the viability of technology required to incorporate concepts which will allow the binary power cycle to have a performance approaching practical thermodynamic maximums. Investigations in progress are examining the potential improvements that result from allowing super-saturated turbine expansions. During these metastable expansions, the working fluid is maintained as a supersaturated vapor during the turbine expansion process; if at equilibrium conditions, liquid condensate would be present. If it can be shown that these expansions proceed without a degradation in turbine performance or damage to the turbine internals by any condensate which forms, a projected 8% improvement in the performance of the advanced cycle could be realized. Investigators are presently examining the condensation behavior of these expansions, as well as determining the impact of these expansions on turbine performance.

17 WIND ENERGY

1704 Economic, Industrial, and Business Aspects

Refer also to citation(s) 7561, 7610, 7626

7609 (NEI-DK–1772) **Wind energy market study Eastern Europe. Czech and Slovak Republics.** Skjerk Christensen, P. Risoe National Lab., Roskilde (Denmark). Systems Analysis. Jun 1994. 30p. Order Number DE95737560. Source: OSTI; NTIS; INIS.

The main objective of the THERMIE Associated Measure WE05 is to study the conditions for utilising wind power and estimate the market for wind power in Eastern Europe. This report describes the results of a study of the conditions in the Czech and Slovak republics, which has been concentrated on the following areas: A collection of information on the wind energy potential in these countries and the present structure of the power production system including costs; A search for information concerning payback prices, subsidies, etc. with relation to renewable energy sources, especially wind power, existing wind turbines and their production; An estimate of the possibilities for co-production of wind turbines by Czech, Slovak, and EC factories; A compilation of information on rules and legislation pertaining to the establishment of wind turbines and to power production by wind, e.g. regulations related to grid connections, safety, and environmental production. In order to promote the utilisation of wind power in the Czech and Slovak Republics, some recommendations based on this study may be put forward: the operation of pilot plants should be evaluated in order to compare the recorded production with that which is estimated theoretically based on measured wind data. Existing wind data should be supplemented with new measurements especially at sites that based on current knowledge may be suitable for establishing wind parks. The economic feasibility of wind power in these countries should be calculated based on the best available physical and economic data. (EG)

1706 Wind Energy Engineering

7610 (NEI-DK–1773) **Wind energy market study Eastern Europe. Poland.** Skjerk Christensen, P. Risoe National Lab., Roskilde (Denmark). Systems Analysis. Apr 1994. 23p. Order Number DE95737561. Source: OSTI; NTIS; INIS.

The main objective of the THERMIE Associated Measure WE05 is to study market conditions and estimate the market for wind power in Eastern Europe. This report describes the results of a study of the conditions in Poland, which has been concentrated on the following areas: wind energy potential in Poland; data concerning the present structure of the power production system including costs; payback prices, subsidies, etc. with relation to renewable energy sources, especially wind power; information on existing wine turbines and their production in Poland; possibilities for co-production of wind turbines by Polish and EC factories, and rules and legislation pertaining to the establishment of wind turbines and to power production by wind, eg regulations related to grid connection, safety and environment. According to existing data there are possibilities for using the wind potential in certain parts of poland. The wind data have to be improved if particular sites are considered for wind parks. The current official plans concerning the energy system have taken renewable sources into consideration, including wind power that is estimated to contribute $\approx$ 1 GWh by 2005-2010. Wind turbines may be connected to the public grid with due regard to the strength of the line. Presently, the owner has to pay all the costs, however, new rules are under consideration. The conditions for the connection and operation of wind turbines have to be discussed with the particular utility on an ad-hoc basis. (EG)

7611 (NEI-DK–1795) **Lightning protection of wind turbine generator systems and EMC problems in the associated control systems.** Maribo Pedersen, B. (ed.). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. 164p. (CONF-9403191–: 26. Meeting of experts on lightning protection of wind turbine generator systems and EMC problems in the associated control systems, Cologno Monzese (Italy), 8-9 Mar 1994). Order Number DE95737572. Source: OSTI; NTIS.

On the 8th and 9th of March 1994 an invited group assembled at the Centro Ricerca Elettrica of ENEL in Milan to discuss lightning protection of wind turbine generator systems. Wind turbines are tall structures and are often located in high level thunderstorm areas and positioned on the top of hills. Consequently they are highly exposed to lightning and cases have been reported of damages and malfunctioning following lightning strikes. The damages have involved from one side the blades and the structure and from the other side have affected the performance of the inner electric/electronic parts. In the following the main aspects of interest are mentioned. The economic impact of lightning depends on the probability that a given wind turbine is struck by a lightning. This probability depends on: the lightning flash density of the territory; the geometry of the wind turbine; the installation site orography;

the presence of adjacent structures. Several models and criteria are available for the evaluation of the probable number of strokes to wind turbines. (EG)

7612 (NEI-DK–1795, pp. 5-14) **Lightning protection of wind turbine generator systems. Service experience from Norway and proposed solutions to reduce lightning damage.** Schei, A. (Transinor A/S (Norway)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9403191–: 26. Meeting of experts on lightning protection of wind turbine generator systems and EMC problems in the associated control systems, Cologno Monzese (Italy), 8-9 Mar 1994). In *Lightning protection of wind turbine generator systems and EMC problems in the associated control systems.* 164p. Order Number DE95737572. Source: OSTI; NTIS.

This paper presents an overview of the service experience with respect to lightning damages to wind turbine generator systems in Norway during the period 1986 to February 1994. The systems covered except one (V-aa) are all located on the north-west coast of the southern part of Norway, where exposure to positive lightning strokes during the winter season is very well known. After the presentation of typical lightning data and service experience, the paper try to analyze the reason of the damages and put forward proposals to modify the systems with the aim to obtain better service reliability. Today the failure rates due to lightning are far too high (one per year and wind turbine system) to be acceptable. The aim is to open up for discussion of the problems and the ideas of how to solve them. (au)

The utility power industries have been studying the nature of lightning and its impact on power systems for many years. This study allows them improve reliability and power quality of the power systems. Lightning is known to be one of the causes of electrical breakdown in transmission lines and telecommunication lines. The reliability of power sources from the utility affects many people directly or indirectly. A breakdown in any part of the power network may eventually cost millions of dollars if it triggers the interruption of industrial processes. With the increasing penetration of wind power generation into the utility grid, the lightning problem forces the utility engineer to start thinking about minimizing the casualties of lightning on the wind turbine generation systems on the wind farm. It is necessary for the power engineer to learn and better understand about the nature of the lighting, as well as the protection against lightning. This paper deal with the cause and effect of power disturbance due to lightning on wind power generation. The protection of the system from the lightning is similar to insurance requirements. We have to understand the nature of the lightning and the statistical data of the lightning before we finally decide on how much we should invest on lightning protection. The data of lightning occurrences on the wind farm and the preventative measures practiced by the wind farm will be presented as well. (au) (15 refs.)

7614 (NEI-DK–1795, pp. 55-68) **Lightning protection of large rotor blades design and experience.** Dalen, G. (Vattenfall Utveckling AB (Sweden)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9403191–: 26. Meeting of experts on lightning protection of wind turbine generator systems and EMC problems in the associated control systems, Cologno Monzese (Italy), 8-9 Mar 1994). In *Lightning protection of wind turbine generator systems and EMC problems in the associated control systems.* 164p. Order Number DE95737572. Source: OSTI; NTIS.

Wind Turbines become bigger and bigger. The cost involved with maintenance must be kept to a minimum. Damage due to lightning strikes can be very severe and expensive. New materials are used in the rotor blades that may lead to new problems regarding lightning protection. Sweden and Vattenfall have been involved in large Wind Turbines for many years. This paper describes the design and experience regarding lightning protection of rotor blades for Wind Turbines. Three examples will be described: The Maglarp Wind Turbine, the Naesudden II Wind Turbine and the experience from Lyse Wind Power Station. (au)

7615 (NEI-DK–1795, pp. 69-78) **Lightning flashes to non-conductive (fibre glass) rotor blades of wind turbines.** Pedersen, Aa.E. (Technical University of Denmark, Lyngby (Denmark)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9403191–: 26. Meeting of experts on lightning protection of wind turbine generator systems and EMC problems in the associated control systems, Cologno Monzese (Italy), 8-9 Mar 1994). In *Lightning protection of wind turbine generator systems and EMC problems in the associated control systems.* 164p. Order Number DE95737572. Source: OSTI; NTIS.

In the past, there have been repeated discussions concerning the probabilities of lightning flashes to conductive and non-conductive objects, and concerning the way in which the interception efficiency is influenced by the resistances of the object, including the effect of the value of the grounding resistance. Opinions have ranged from the belief that non-conductive objects were self-protecting, to the belief that objects with and without lightning protection were exposed to approximately the same striking probability, regardless of the resistances in the objects. The same controversy has existed for wind turbines equipped with non-conductive rotor blades (f. inst. fibre glass). In connection with an analysis of lightning damage to a fibre glass rotor blade of a wind turbine, evidence of importance for the solution of this controversy has been revealed. (au)

The knowledge of the frequency of lighting strikes on a wind power generator is one of the most important parameters in judging its reliability. To evaluate the probable number of direct strikes on the generator structure a model of the 'lightning mechanism' is needed which allows the impact point to be defined by taking into account both the main lightning parameters and the effects related to the orography of the point of installation. From among the algorithms available the model implemented by ENEL-CESI is the only one that simulates the progression of lightning channels form the cloud to the earth, taking into account the orography. Testing activity was performed to determine the behavior of windmill blades following lightning strokes. In fact, for windmill power stations, depending on the area where they are installed and the structure of the windmills, there is a good possibility that a windmill may be struck by lightning. The parts with the highest risk of a lightning stroke are the blades. The impact of the lightning and the current flow over different parts may cause structural damage ('direct effects' of lightning) and thus prevent the windmill from operating at full capacity. (au)

There is now some 140 MW of installed wind turbine capacity in the UK, concentrated in the high wind speed areas of Wales and the western parts of England. The latest round of the Non fossil Fuel Obligation, which provides the premium price for wind power, is likely to see at least a doubling of this capacity as well as installations in Scotland and Northern Ireland. A typical wind farm consists of some 15-30 medium size (300-400 kW) wind turbines spread out over a wide area. The ground of the upland areas of the west of England and Wales is usually rocky with only a shallow layer of topsoil or peat. Therefore earthing (or grounding in US terminology) of extensive wind farms on high resistivity rocky soil has presented a considerable challenge to wind farm designers. In the rocky ground of wind farm sites it is not practical to use driven rod electrodes. Therefore, long horizontal strip conductors are laid in the trenches of the power collection cable network. On some sites these electrodes may be up to 5 km in length. The UK standards give little guidance o how a suitable earthing system using these very long electrodes might be designed, installed or tested and so a research project was undertaken by UMIST and National Wind Power with support from the UK Department of Trade and Industry. (au)

7620 (NREL/TP–440-7224) **Wind technology development: Large and small turbines.** Thresher, R.W.; Hock, S.M.; Loose, R.R.; Goldman, P. National Renewable Energy Lab., Golden, CO (United States). Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-941210–2: Power generation conference, Orlando, FL (United States), 7-9 Dec 1994). Order Number DE95000286. Source: OSTI; NTIS; GPO Dep.

Wind technology has developed rapidly over the last decade with the design and development of advanced systems with improved performance, higher reliability, and lower costs. During the past several years, substantial gains have been made in wind turbine designs, lowering costs to an average of $0.05/(kWh) while further technology development is expected to allow the cost to drop below $0.04/(kWh) by 2000. As a result, wind is expected to be one of the least expensive forms of new electric generation in the next century. This paper will present the technology developments for both utility-scale wind turbines and remote, small-village wind turbines that are currently available or in development. Technology innovations are being adapted for remote and stand-alone power applications with smaller wind turbines. Hybrid power systems using smaller 1 to 50 (kW) wind turbines are being developed for non-grid-connected electrical generation applications. These village power systems typically use wind energy, photovoltaics, battery storage, and conventional diesel generators to power remote communities. Smaller turbines are being explored for application as distributed generation sources on utility grids to supply power during periods of peak demand, avoiding costly upgrades in distribution equipment. New turbine designs now account for turbulence-induced loads, unsteady aerodynamic stall effects, and complex fatigue loads, making use of new technology developments such as advanced airfoils. The new airfoils increase the energy capture, improve the operating efficiency, and reduce the sensitivity of the airfoils to operation roughness. Electronic controls are allowing variable rotor speed operation; while aerodynamic control devices, such as ailerons and flaps, are used to modulate power or stop the rotor in high-speed conditions. These technology trends and future turbine configurations are being sponsored and explored by the U.S. Department of Energy's Wind Energy Program.

7621 (NREL/TP–441-7077) **Using digital filtering techniques as an aid in wind turbine data analysis.** Young, T. (Univ. of Colorado, Boulder, CO (United States). BioServe Space Technologies). National Renewable Energy Lab., Golden, CO (United States). Nov 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-9304280–1: AIAA Region 5 student conference, Ft. Collins, CO (United States), 21-24 Apr 1993). Order Number DE94011862. Source: OSTI; NTIS; GPO Dep.

Research involving very large sets of digital data is often difficult due to the enormity of the database. In the case of a wind turbine operating under varying environmental conditions, determining which data are representative of the blade aerodynamics and which are due to transient flow ingestion effects or errors in instrumentation, operation, and data collection is of primary concern to researchers. The National Renewable Energy Laboratory in Golden, Colorado collected extensive data on a downwind horizontal axis wind turbine (HAWT) during a turbine test project called the Combined Experiment. A principal objective of this experiment was to provide a means to predict HAWT aerodynamic, mechanical, and electrical operational loads based upon analytical models of aerodynamic performance related to blade design and inflow conditions. In a collaborative effort with the Aerospace Engineering Department at the University of Colorado at Boulder, a team of researchers has evolved and utilized various digital filtering techniques in analyzing the data from the Combined Experiment. A preliminary analysis of the data set was performed to determine how to best approach the data. The reduced data set emphasized selection of inflow conditions such that the aerodynamic data could be compared directly to wind tunnel data obtained for the same airfoil design as used for the HAWT's blades. It will be shown that this reduced data set has yielded valid, reproducible results that a simple averaging technique or a random selection approach cannot achieve. These findings provide a stable baseline against which operational HAWT data can be compared.

7622 (NREL/TP–442-7111) **GPP user's guide - a general-purpose postprocessor for wind turbine data analysis.** Buhl, M.L. Jr. National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95000293. Source: OSTI; NTIS; GPO Dep.

GPP (pronounced "jeep") is a General-Purpose Postprocessor for wind turbine data analysis. The author, a member of the Wind Technology Division (WTD) of the National Renewable Energy Laboratory (NREL), developed GPP to postprocess test data and simulation predictions. GPP reads data into large arrays and allows the user to run many types of analyses on the data stored in memory. It runs on inexpensive computers common in the wind industry. One can even use it on a laptop in the field. The author wrote the program in such a way as to make it easy to add new types of analyses and to port it to many types of computers. Although GPP is very powerful and feature-rich, it is still very easy to learn and to use. Exhaustive error trapping prevents one from losing valuable work due to input errors. GPP will, hopefully, make a significant impact on engineering productivity in the wind industry.

7623 (RISO-R–714(EN)) **Wind turbine test Nordtank NTK 500/37. System test.** Markkilde Petersen, S. Risoe National Lab., Roskilde (Denmark). Test Station for Wind Turbines. Dec 1994. 110p. Contract ENS-5332-0001. Order Number DE95737595. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The report describes measurements carried out on the Nordtank NTK 500/37 wind turbine during the period from September 1992 to September 1993. The measurements were carried out at Risoe located near Roskilde Fjord. The test site, the wind turbine, the data acquisition system and the calibration procedures are described. Measurements are made in accordance to a 'system test' as described in the Danish rules for type approval and certification. The safety tests include breaking sequences at normal operation with and without tip brakes and runaway test. The tests are shown as time series. Dynamic response analysis of the wind turbine was carried out during standstill and at normal operational conditions at low and high wind speeds. Selected runs are shown as time tracks at low and high wind speeds. The structural loads are analyzed statistically. Ten minutes mean, standard deviation, maximum, and minimum values are shown as function of the wind speed. The fatigue loads including blade, rotor and tower loads are evaluated using rainflow counting. The equivalent load ranges are calculated at different wind speeds and turbulence, and at forced yaw misalignments. (au) (11 tabs., 123 ills., 5 refs.)

7624 (RISO-R–730(EN)) **Verification of design basis 2 - a coupled aeroelastic wind turbine model.** Larsen, G.C.; Soerensen, P. Risoe National Lab., Roskilde (Denmark). Test Station for Wind Turbines. Oct 1994. 153p. Contract ENS-1364/92-0005. Order Number DE95737571. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

EFP-92.

A coupled aeroelastic horizontal axis wind turbine model has been developed, and the model has been implemented in an user-friendly computer package to run on a personal computer. The code is so far designed for modelling wind turbines in normal operation outside the stall region, and includes three categories of models. These are a load part (i.e. wind field description, gravity, centrifugal forces, Coriolis forces, and inertia forces due to elastic deformations), an aerodynamic part, and a structural dynamic part. The structural model comprises two degrees of freedom on each blade, one degree of freedom on both main shaft and generator, and four degrees of freedom related to the tower. The main characteristics of the model are briefly described, but the primary goal of the present report is to present example solution with the code that verify and demonstrate its usage. For that purpose measurements and simulations, related to both simple deterministic load cases and to more complex scenarios involving loads of both deterministic and stochastic character, have been compared. The simple load cases include loads from gravity- and centrifugal forces, and fully satisfactory predictions were obtained from the model. For the complex load cases three turbines, ranging in size from 300 kW to 2 MW and operating under different conditions (with respect to mean wind speed, turbulence intensity, turbulence length scale, and coherence), have been simulated with the code and subsequently compared with measurements performed. Blade-, rotor, and tower loads have been compared in terms of time series, azimuthal binned signals, and power spectra. A most satisfactory consistency between simulations and measurements is obtained for the load cases outside the stall-region, in agreement with the aerodynamic linearizations inherent in the model. (au) (13 tabs., 131 ills., 11 refs.)

A laboratory for lightning current tests has been set up at CESI allowing the generation of the lightning currents foreseen by the Standards. Lightning tests are carried out on different objects, aircraft materials and components, evaluating the direct and indirect effects of lightning. Recently a research has been carried out to evaluate the effects of the lightning current flow through bearings with special reference to wind power generator applications. For this purpose, lightning currents of different amplitude have been applied to bearings in different test conditions and the damages caused by the lightning current flow have been analysed. The influence of the load acting on the bearing, the presence of lubricant and the bearing rotation have been studied. (au)

7626 (NEI-DK–1795, pp. 95-100) **A methodology for the evaluation of lightning protection measures for wind turbine generating stations.** Behnke, M.R. (Kenetech Windpower, Inc., Livermore, California (United States)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9403191–: 26. Meeting of experts on lightning protection of wind turbine generator systems and EMC problems in the associated control systems, Cologno Monzese (Italy), 8-9 Mar 1994). 7627 (ANL/ES/CP–83413) **Heat-rate improvements obtained by retubing condensers with new, enhanced tube types.** Rabas, T.J. (Argonne National Lab., IL (United States)); Taborek, J. Argonne National Lab., IL (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941142–28: American Society of Mechanical Engineers' winter annual meeting, Chicago, IL (United States), 9-11 Nov 1994). Order Number DE95004509. Source: OSTI; NTIS; GPO Dep.

Significant fuel savings can be achieved at power plants by retubing the condensers with enhanced tubes. Because of the higher overall heat-transfer coefficient, the exhaust steam is condensed at a lower pressure and the plant efficiency is therefore increased or plant heat rate is reduced. Only the spirally indented type of enhanced tube is currently being used in the U.S. and most other countries; however, different types of enhanced tubes have been proposed for power-plant condensers, each with their own set of attributes. This paper determines what attributes and their magnitudes of enhanced tubes lead to the most energy savings as measured by reduction of the plant heat rate. The particular attributes considered are the inside and outside enhancement levels, the inside efficiency index (inside enhancement level divided by pressure-drop increase), and the enhanced-tube fouling-rate multiplier. Two particular condensers were selected because all necessary information were known from previous heat-rate studies such as the condenser geometry, the circulating-water pump and system information, and the low-pressure turbine characteristics. These are "real-world" condensers and therefore the finding will be representative for many other condenser-retubing applications. However, the authors strongly recommend that an economic evaluation be performed at each site to determine the energy savings and payback time. This generic investigation showed that the outside enhancement level is the most important attribute, and a value of about 1.5 can lead to heat-rate savings of about 20 to 40 Btu/kW-hr. Increasing the inside enhancement is less effective because

of the increased pressure drop that leads to a reduction of the coolant flow rate and velocity.

7628 (DOE/FE/62803–T1) **SYNCHEM feasibility report: Phase 1.** Texaco Development Corp., White Plains, NY (United States). [1995]. 246p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-93FE62803. Order Number DE95004516. Source: OSTI; NTIS; GPO Dep.

Several Czech and US companies have entered into a development agreement for the purposes of determining the technical and economic feasibility and overall financeability of an integrated gasification combined cycle (IGCC) regional energy facility to be located adjacent to the Chemopetrol refinery in Litvinov, Czech Republic. The Project would use a feedstock comprised of coal supplied by Doly a upravny Komorany s.p. (DUK) coal mining company and mined from the Most/Litvinov area together with high sulfur residual oils from the Chemopetrol refinery. When gasified together with oxygen from an Air Products air separation plant, and based on an average yearly consumption of 2,100K metric tons per year of coal (as delivered) and 630K tonnes per year of oil, approximately 11 million normal cubic meters per day of syngas will be produced. At its current projected design capacity, when combusted in two General Electric advanced technology Frame 9FA gas turbines, the Project will produce approximately 690MW of electric power; 250 metric tons/hour of steam for process; and 135 thermal equivalent MW of district heat. The Feasibility Phase efforts described in this report indicate the real possibility for a successful and profitable IGCC Project for the Czech Republic. It is therefore incumbent upon all the Project Participants to review and evaluate the information contained herein such that a go/no-go decision can be reached by early next year.

7629 (DOE/MC/27363–3870) **Tampa Electric Company Polk Power Station Unit Number 1. Annual report, January–December, 1993.** Tampa Electric Co., FL (United States). Aug 1994. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-91MC27363. Order Number DE95000042. Source: OSTI; NTIS; GPO Dep.

This report satisfies the requirements of Cooperative Agreement DE-FC21-91MC27363, novated as of March 5, 1992, to provide an annual update report on the year's activities associated with Tampa Electric Company's 250 MW IGCC demonstration project for the year 1993. Tampa Electric Company's Polk Power Station Unit 1 (PPS-1) Integrated Gasification Combined Cycle (IGCC) demonstration project will use a Texaco pressurized, oxygen-blown, entrained-flow coal gasifier to convert approximately 2,000 tons per day of coal (dry basis) coupled with a combined cycle power block to produce a net 250 MW electrical power output. Approximately 50% of the raw, hot syngas is cooled to 900 F and passed through a moving bed of zinc-based sorbent which removes sulfur containing compounds from the syngas. The remaining portion of the raw, hot syngas is cooled to 400 F for conventional acid gas removal. Sulfur-bearing compounds from both cleanup systems are sent to a conventional sulfuric acid plant to produce a marketable, high-purity sulfuric acid by-product. The cleaned medium-BTU syngas from these processes is routed to the combined cycle power generation system where it is mixed with air and burned in the combustion section of the combustion turbine. Heat is extracted from the expanded exhaust gases in a heat recovery steam generator (HRSG) to produce steam at three pressure levels for use throughout the integrated process. A highly modular, microprocessor-based distributed control system (DCS) is being developed to provide continuous and sequential control for most of the equipment on PPS-1.

7630 (DOE/PC/89663–T14) **Development of a coal quality expert. Technical progress report No. 16.** CQ, Inc., Homer City, PA (United States). 2 Aug 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-90PC89663. Order Number DE95005468. Source: OSTI; NTIS; GPO Dep.

This report covers the period from January 1 through March 31, 1994. Five companies and five host utilities have teamed with CQ Inc. and ABB/CE to perform the work on this project. The work falls under DOE's Clean Coal Technology Program category of "Advanced Coal Cleaning". The 51-month project will provide the utility industry with a PC software program to confidently and inexpensively evaluate the potential for coal cleaning, blending, and switching options to reduce emissions while producing lowest cost electricity. Specifically, this project will: (1) Enhance the existing Coal Quality Information System (CQIS) database and Coal Quality Impact Model (CQIM) to allow confident assessment of the effects of cleaning on specific boiler cost and performance; (2) Develop and validate a methodology, Coal Quality Expert (CQE), which allows accurate and detailed predictions of coal quality impacts on total power plant capital cost, operating cost, and performance based upon inputs from inexpensive bench-scale tests.

7631 (ETDE-DE–3) **Experts' opinion: Heat exchangers in power plant engineering. Pt. 1. Enhanced efficiency through the further development of heat exchanger technologies.** Forschungszentrum Juelich GmbH (Germany). Projekttraeger Biologie, Energie, Oekologie; Fichtner Development Engineering GmbH, Stuttgart (Germany). Apr 1992. 61p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326746A. Order Number DE95738932. Source: OSTI; NTIS (US Sales Only).

An investigation into this subject must consider not only conventional power plant concepts but also innovative, coal-fired combined-cycle power plants, whose efficiency can be distinctly enhanced by increasing their upper process temperature. This involves, inter alia, higher demands on heat exchangers that conventional metal recuperators do not meet. The first of the expertise comprises the following tasks: - survey of heat exchangers at power stations, - description of the state of the art of such heat exchangers (technical specification, limits of use, list of manufacturers), - listing of those heat exchangers whose further development may result in higher efficiency. On the basis of the results of this first part of the expertise it was decided to investigate, in a second part, an innovative combined-cycle process with an indirectly coal-fired gas turbine. In this process the flue gas heat liberated by the combustion of coal is transferred to a clean medium used to operate a gas turbine. To ensure the efficiency of the gas turbine process this heat transfer must take place at temperatures far higher than 1000 C. As a consequence, demands on the heat exchanger are such as cannot be met by conventional engineering. Consequently, this high-temperature heat exchanger represents the central development target of the envisaged combined-cycle process with coal firing. (orig./GL)

7632 (STUK-YTO-TR–54) **Experience of reliability of programmable control systems.** Jaervinen, J. (Ekono Oy, Espoo (Finland)); Mikkanen, M.; Heimbuerger, H. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). 1993. 34p. (In Finnish). Order Number DE95737615. Source: OSTI; NTIS.

The automatic control system reliability project studied operational experience of the use of programmable control systems at six conventional power plants. The emphasis in the project was on the analysis and classification of failures occurred, the failure analysis and recording practice used at the plants and on the maintenance of the control system. Moreover, the frequency of plug-in unit faults was evaluated. These failures are usually investigated and corrected under the supervision of plant management. The maintenance of programmable automatic control systems is primarily corrective, that is, faults are corrected when they occur. There are few points which need preventive maintenance. The maintenance of the programs and modifications require personnel specialized in this kind of work. The need for modifications varies very much depending on how well the application has been designed. The automatic control systems at the plants studied caused very few disturbances to production. The redundancy guarantees that failures in individual equipment do not cause interruptions in production. However, faults in the design of the application and in the installation have occurred also after the Commissioning in most plants. On the basis of the study, it can be assessed that the integration of a control system with investment projects and design methods has a decisive role in achieving good results. Flexible and right-timed communication between process and automation designers and sufficient knowledge of processes are necessities for producing reliable systems.

The project involves testing at six full-scale utility flue gas desulfurization (FGD) systems to evaluate low capital cost upgrades that may allow these systems to achieve up to 98% SO_2 removal efficiency. The upgrades to be evaluated mostly involve using additives in the FGD systems. The "base" project involved testing at the Tampa Electric Company Big Bend station. All five potential options to the base program have been exercised by DOE involving testing at the Hoosier Energy Merom Station (Option 1), the Southwestern Electric Power Company Pirkey Station (Option 2), the PSI Energy Gibson Station (Option 3), the Duquesne Light Elrama Station (Option 4) and the New York State Electric and Gas Company Kintigh Station (Option 5). By the end of June 1994, testing was completed for the base project and for Options 1 through 4, and was just about to begin for Option 5. Section 2, Project Summary, provides a brief overview of the status of technical efforts on this project. Section 3, Results, summarizes the outcome from these technical efforts during the quarter. Section 4, Plans for the Next Reporting Period, provides an overview of the technical efforts that are anticipated for the third quarter of calendar year 1994.

Work was continued on Tasks 2, 4, 7 and 14 and on Task 8. Lifetime tests were carried out on d-DMA absorption/desorption capability for SO_2. The d-DMA capacity did not degrade upon repeated exposure to SO_2. Experiments were also run using Co(II)-phthalocyanine for NO_x absorption at 70°C. SO_2 removal was studied using 200 fiber hollow fiber contactor. Since wet scrubbing of SO_2 will be the first of the two absorption processes, the experiment was carried out to examine the influence of NO presence on SO_2 removal. It was demonstrated that 527 ppM of NO in feed gas did not affect the SO_2 removal rate. The results of mass transfer experiments at 500 and 1000 sccm flow rates are presented. Over 80 hrs of particle deposition operation, the mass transfer coefficients were observed to decrease by 20–30%. The reason for this decrease appears to be particle coating formation on the inner walls of the fiber. Preliminary economic evaluation was completed of the proposed technology. The capital costs are lower by more than a factor of two compared to widely used existing process. Also, the operating costs are shown to be lower compared to commonly employed scheme by using heat integration network.

Particle separation at 'high temperatures' is a matter of interest and concern in many applications, e.g. power generation, waste incineration, combined gas and particle separation in many industrial processes. This presentation is confined to temperatures < 1000 deg C and will discuss some recent results and some open questions for further research regarding cyclones, granular beds and ceramic filters.

In this study, a continuous monitoring system based on Tapered Element Oscillating Microbalance (TEOM) has been developed and tested in a real scale coal fired power plant. The particle mass concentration is measured with a Tapered Element Oscillating Micro- balance (TEOM) developed by Rupprecht and Patashnick Co., Inc. (Albany, NY, USA). The TEOM-based measurement system has been found suitable both for measuring concentration level and observing fast changes in concentration. Particle deposition in dilution system need to be determined in detail when accurate emission values are desired. Measuring of very low concentration (large dilution ratio) is affected by noise and by error in concentration due to evaporation of particles from TEOM-filter. A large noise makes it necessary to use longer data-averaging time. Accuracy of measurement and time resolution is better with a small dilution ratio, but the longest possible duration of measurement is then shorter. About 5 mg of particles can be collected to a TEOM-filter. The longest possible duration of measurement without changing the filter is about 1 day with one diluter and about 10 days with two diluters, if the mass concentration of the sample is 10 mg/m^3 and the flow rate to TEOM-monitor 5 l/min. Reducing the sample flow rate increases the measurement time. On the other hand, changing a TEOM-filter is a simple operation. Stabilization of TEOM-monitor after change of filter takes 1-2 hours.

7638 (NEI-DK–1764) **Membrane contactors to replace conventional scrubbers.** Brummerstedt Iversen, S. FLS Miljoe A/S, Valby (Denmark); Danmarks Ingenioerakademi, Lyngby (Denmark). Mar 1994. 170p. Contract ENS-1323/90-0026. Order Number DE95737525. Source: OSTI; NTIS.

EFP-90.

Conventional flue gas cleaning processes are characterized by huge space requirements and related high capital costs. Recent studies on membrane contactors have shown that the contactor volume can be reduced considerably due to the high packing density in this contactor type. This dissertation describes an experimental and theoretical study of the possibilities for replacing conventional scrubbers for flue gas desulfurization by membrane contactors. Three major tasks are critical for development of the membrane based flue gas cleaning process: the membrane, the module design and the process design. A comprehensive study for characterisation of microporous membranes for use in membrane contactors has been carried out in the laboratory. The effect of membrane parameters have been investigated for a wide variety of hydrophobic, microporous membranes in both flat sheet and hollow fibre form. The investigation was performed by SO_2 diffusivity experiments, N_2- and water permeability experiments, and measurements of NaCl diffusivity through prewetted membranes. Additional information about the pore structures of the flat membranes was obtained from scanning electron microscope photos and measurements of the bubble point pressure. The performance and economics of a membrane contactor flue gas desulfurization process with electrodialytic regeneration of the spent absorbent solution (MCED process) has been evaluated and compared with conventional flue gas desulfurization processes. The basis for the comparison is 96.5% SO_2 removal from a 500 MW power plant

burning high sulfur coal. The analysis shows that the MCED process will be highly competitive with the conventional flue gas desulfurization processes. For the best hollow fibre available today, the projected capital costs is about 30% lower than the limestone process with on-site byproduct disposal. (EG)

The Danish Technological Institute and I. Krueger A/S have cooperated in developing a computer program MODS, to compute condensing flue gas coolers. The computer program focuses on the computation of crossflow/counterflow heat exchangers, and certain adjustments and manual calculations are required in order to use the program on flue gas coolers with parallel flow or parallel flow/counterflow coupling section by section. The computer program computes performance and temperature data, amount of condensate and pressure loss in connection with complete or partial condensing flue gas cooling. Through laboratory tests it has been demonstrated that the measured values are in keeping with the computed values within an average uncertainty margin of approx. 8% with regard to the determination of output while full-scale plant measurements have shown somewhat larger discrepancies between the measured values and the computed data. The computer program must be partly reconstructed and adjusted to try to achieve better agreement between measured and computed values. The computer program can with advantage be upgraded to be able to handle an arbitrary coupling variant (parallel/counterflow). (au)

7640 (VTT-TIED–1445) **Usability of catalytic gas cleaning in a simplified IGCC power system. Deactivation of Ni/Al_2O_3 catalysts. Literature review.** Hepola, J. (Technical Research Centre of Finland, Espoo (Finland). Lab. of Fuel and Process Technology). Technical Research Centre of Finland, Espoo (Finland). 1993. 80p. Order Number DE95737600. Source: OSTI; NTIS.

Nickel-based catalysts have proven to be efficient for tar and ammonia decomposition in laboratory scale gas purification experiments, in which biomass, peat and coal gasification was applied. A potential location for a separate catalyst reactor for an IGCC process using biomass gas derived from a fluidized-bed gasifier is downstream of cyclones before the ceramic filter unit. Complex nature of biomass and peat gas cannot be simulated completely in the laboratory. Long-term tests using a gas stream from an operating gasifier are likely the best way to test catalyst deactivation. Catalyst deactivation may be chemical, mechanical or thermal. Poisoning, fouling, thermal degradation and vaporization are the four intrinsic mechanisms. Poisoning and thermal degradation are generally slow and irreversible; fouling with coke and carbon is rapid but easily reversed by gasification. Loss of metals by vaporization is completely irreversible. Deactivation is more easily prevented than cured. Poisoning by impurities may be prevented by purifying the reactants. Carbon deposition and coking may be prevented by minimizing formation of precursors and by manipulating mass-transfer regimes to minimize the effect of carbon or coke on activity. Sintering is avoided by operating at a low temperature. The catalyst should also have a sufficient mechanical strength so that it does not dust or crack while in operation. Thermodynamic calculations showed that in the process conditions likely to be used in the catalytic cleaning unit, nickel oxide is reduced to metallic nickel, carbon (graphite) and nickel sulphide is formed depending on the temperature, pressure and the gas composition of the process. The higher the pressure the more probable is the formation of carbon and nickel sulphide. The probability for carbon formation decreases when the moisture content of the gas increases.

Two applications of the neural network methodology in the field of nuclear safety analysis are described. The first one is the 3-D response surface generation by the Back Propagation Method. The results were not satisfactory. The second is the application of the Optimal Statistical Estimator methodology for the generation of 8-D response surface. It was used as a statistical part of the Code, Scaling, Applicability and Uncertainty (CSAU) methodology for the evaluation of Large Break Loss of Coolant Accident. The result was comparable to the one obtained by the ordinary method. (author). 24 refs, 5 figs, 3 tabs.

This paper is devoted to the representation of knowledge in an expert system REPSA1ES (Reliability Evaluation and Probabilistic Safety Analysis - level 1 - Expert System). The prototype system has been designed to facilitate the probabilistic safety analysis (PSA) of complex hazardous industrial systems and to support safety oriented decision making during the design phase and operation of process systems. Taking into account known difficulties to manage complexity of logical and probabilistic modelling of nuclear power plants using the conventional PSA software packages we decided to represent information in a graphical form, whenever it is justified, and to automate the process of coding of objects to avoid errors. The software system consists of a CAD package, data bases, a shell for building expert system and several software modules to enable: the effective communication with the user, data and knowledge acquisition, the initiation of inferring to support logical modelling of the plant, selection of reliability models with input parameters as well as the quantitative probabilistic evaluation of accident scenarios. Given are 333 nuclear power plant safety principles. The basic principles require that (i) during normal plant operation, no individual shall be exposed to ionizing radiation doses exceeding specified dose limits; (ii) exposure of any individual shall be kept as low as reasonably achievable; (iii) the collective effective dose equivalent for professionals and the public shall be kept as low as reasonably achievable; (iv) all reasonable provisions to prevent accidents shall

be adopted; and (v) all reasonable measures shall be taken to minimize radiological consequences of accidents. The remaining principles are aimed at securing adherence to the basic principles during nuclear power plant commissioning and start-up. (J.B.).

5 fig.

A personal computer based fast fourier transform (FFT) analyzer has been developed for frequency spectrum analysis of signals from nuclear reactor. The system can perform window smoothing, computation of auto- and cross-power spectral density, coherence and auto and cross-correlation functions. The feature of 16 analogue signals acquisition with high precision and high sampling frequency makes the analyzer suitable for malfunction diagnosis of nuclear reactors using reactor noise analysis. The development work for the fourier analyzer was undertaken as a part of IAEA research contract no. 5925/RB. The applications of the FFT analyzer are described in reactor transfer function measurements and nuclear instrumentation channels frequency response testing. (author). 5 fig.

The design of nuclear reactor fuel reload patterns involves a great amount of data, calculations, safety criteria and restrictions to be observed, as well as the knowledge of experts working in this field. Many reload patterns can be generated but only a few are optimal. In this paper the current development stage of a system based on heuristic search methods to generate and optimize fuel reload patterns using engineers is presented. The main components of the system are the knowledge base, the inference engine, the 3D Boiling Water Reactor (BWR) simulator PRESTO and the user interface. The system has already developed and evaluated fuel reload patterns for the Laguna Verde Nuclear Power Plant, achieving similar patterns to those generated by the fuel supplier. Further work on optimization of patterns is about to be started. In the near future this system will be integrated in an overall system based on graphics environment to perform in-core fuel management analysis for BWR nuclear reactors. (author). 2 refs.

7648 (NUREG/CR–6214) **Production and testing of the VITAMIN-B6 fine group and the BUGLE-93 broad-group neutron/photon cross-section libraries derived from ENDF/B-VI nuclear data.** Ingersoll, D.T. (Nuclear Regulatory Commission, Washington, DC (United States)); White, J.E.; Wright, R.Q.; Hunter, H.T.; Slater, C.O.; Greene, N.M.; Roussin, R.W.; MacFarlane, R.E. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology; Oak Ridge National Lab., TN (United States). Jan 1995. 167p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (ORNL–6795). Source: OSTI; NTIS; GPO; INIS.

A new multigroup cross-section library based on ENDF/B-VI data has been produced and tested for light water reactor shielding and reactor pressure vessel dosimetry applications. The broad-group library, which is designated BUGLE-93, is intended to replace the aging BUGLE-80 and SAILOR libraries. The processing methodology is consistent with ANSI/ANS 6.1.2, since the ENDF data were first processed into a fine-group, pseudo-problem-independent format and then collapsed into the final broad-group format. The fine-group library, which is designated VITAMIN-B6, contains 120 nuclides. The BUGLE-93 47-neutron-group/20-gamma-ray-group library contains the same 120 nuclides processed as infinitely dilute and collapsed using a weighing spectrum typical of a concrete shield. Additionally, BUGLE-93 contains 105 nuclides processed with resonance self-shielding and weighted using spectra specific to BWR and PWR material compositions and reactor models. Several dosimetry response functions and kerma factors for all 120 nuclides are also included with the library. An extensive integral data testing effort was performed to qualify the new library. In general, results using the new data show significant improvements relative to earlier ENDF data.

7649 (SAND–94-2163) **Core damage frequency observations and insights of LWRs based on the IPEs.** Dingman, S.E. (Sandia National Labs., Albuquerque, NM (United States)); Camp, A.L.; Drouin, M.T.; Kolaczkowski, A.; Darby, J.; LaChance, J.L.; Yakle, J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 13p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410216–2: 22. transactions of the water reactor safety information meeting, Bethesda, MD (United States), 24-26 Oct 1994). Order Number DE95004726. Source: OSTI; NTIS; INIS; GPO Dep.

Seventy-eight plants are expected to submit Individual Plant Examinations (IPEs) for severe accident vulnerabilities to the U.S. Nuclear Regulatory Commission (NRC). The majority of the plants have elected to perform full Level 1 probabilistic risk assessments (PRAs) to meet the intent of the IPES. Because of this, it is possible to compare the results from the IPE submittals to determine general observations and "lessons learned" from the IPES. The IPE Insights Program is performing this evaluation, and preliminary results are presented in this paper. The core damage frequency and core damage sequences are identified and compared for pressurized water reactors and boiling water reactors. Examination of the results indicates that variations among plant results are due to a combination of actual plant design/operational features and analysis approaches. The findings are consistent with previous NRC studies, such as WASH-1400 and NUREG-1 150.

7650 (SAND–94-2170C) **Risk contribution from low power, shutdown, and other operational modes beyond full power.** Whitehead, D.W.; Brown, T.D.; Chu, T.L.; Pratt, W.T. Sandia National Labs., Albuquerque, NM (United States); Brooklyn Coll., NY (United States). Dept. of Chemistry. [1995]. 25p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000 ; AC02-76CH00016. (CONF-9410216–3: 22. transactions of the water reactor safety information

meeting, Bethesda, MD (United States), 24-26 Oct 1994). Order Number DE95004727. Source: OSTI; NTIS; INIS; GPO Dep.

During 1989 the Nuclear Regulatory Commission (NRC) initiated an extensive program to carefully examine the potential risks during low power and shutdown operations. Two plants, Surry (a pressurized water reactor) and Grand Gulf (a boiling water reactor), were selected for study by Brookhaven National Laboratory and Sandia National Laboratories, respectively. The program objectives included assessing the risks of severe accidents initiated during plant operational states other than full power and comparing estimated core damage frequencies, important accident sequences, and other qualitative and quantitative results with full power accidents as assessed in NUREG-1150. The scope included a Level 3 probabilistic risk assessment (PRA) for traditional internal events and a Level 1 PRA on fire, flooding, and seismically induced core damage sequences. A phased approach was used in Level 1. In Phase 1 the concept of plant operational states (POSs) was developed to provide a better representation of the plant as it transitions from power to nonpower operation. This included a coarse screening analysis of all POSs to identify vulnerable plant configurations, to characterize (on a high, medium, or low basis) potential frequencies of core damage accidents, and to provide a foundation for a detailed Phase 2 analysis. In Phase 2, selected POSs from both Grand Gulf and Surry were chosen for detailed analysis. For Grand Gulf, POS 5 (approximately cold shutdown as defined by Grand Gulf Technical Specifications) during a refueling outage was selected. For Surry, three POSs representing the time the plant spends in midloop operation were chosen for analysis. These included POS 6 and POS 10 of a refueling outage and POS 6 of a drained maintenance outage. Level 1 and Level 2/3 results from both the Surry and Grand Gulf analyses are presented.

Post accident core damage assessment methodology is a part of nuclear power plant emergency plan. It is used to assess core damage states and extents after an accident. Core damage states include no core damage, fuel clad failure, fuel overheat and fuel melt. The methodology consists of detailed assessment based on sampling system and primary assessment based on on-line monitoring system. A few aspects in post accident core damage assessment methodology developed by Westinghouse in 1984 were improved, such as introducing a modification factor related to fuel burnup and some other factors related to fission product retention on the surfaces of RCS (reactor coolant system) using research results about severe accidents. The methodology and the developed computer code have already been used in Qinshan NPP (nuclear power plant) and can also be used in other PWR (pressurized water reactor) NPPs.

7652 (DOE/SF/19090–T3) **Advanced light water reactor plants system 80+™ design certification program. Annual progress report, October 1, 1993–September 30, 1994.** Combustion Engineering, Inc., Windsor, CT (United States). [1995]. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-91SF19090. Order Number DE95005458. Source: OSTI; NTIS; GPO Dep.

The purpose of this report is to provide a status of the progress that was made towards Design Certification of System 80+™ during the U.S. government's 1994 fiscal year. The System 80+ Advanced Light Water Reactor (ALWR) is a 3931 MW (1350 MWe) Pressurized Water Reactor (PWR). The design covers an essentially complete plant. It is based on EPRI ALWR Utility Requirements Document (URD) improvements to the Standardized System 80 Nuclear Steam Supply System (NSSS) in operation at Palo Verde Units 1, 2 and 3. The NSSS is a traditional two-loop arrangement with two steam generators, two hot legs and four cold legs, each with a reactor coolant pump. The System 80+ standard design houses the NSSS in a spherical steel containment vessel which is enclosed in a concrete shield building, thus providing the safety advantages of a dual barrier to radioactivity release. Other major features include an all-digital, human-factors-engineered control room, an alternate electrical AC power source, an In-Containment Refueling Water Storage Tank (IRWST), and plant arrangements providing complete separation of redundant trains in safety systems. Some design enhancements incorporated in the System 80+ design are included in the four units currently under construction in the Republic of Korea. These units and the System 80+ design form the basis of the Korean standardization program. The Nuclear Island portion of the System 80+ standard design has also been offered to the Republic of China, in response to their bid specification for an ALWR. The ABB-CE Standard Safety Analysis Report (CESSAR-DC) was docketed by the Nuclear Regulatory Commission (NRC) in May 1991 and a Draft Safety Evaluation Report (DSER) was issued in October 1992.

7653 (IAEA-TECDOC–773) **The safety of WWER and RBMK nuclear power plants. Progress report on the IAEA extrabudgetary programme on the safety of WWER and RBMK nuclear power plants, 1992-1994.** International Atomic Energy Agency, Vienna (Austria). Nov 1994. 102p. Order Number DE95615911. Source: OSTI; NTIS (US Sales Only); INIS.

This report, prepared by the IAEA secretariat, provides an overview of the IAEA Extrabudgetary Programme activities and results from 1992 until June 1994. The report describes the scope, the current status of the implementation and major findings and recommendations of the Programme. Though this report concentrates on the results of the Extrabudgetary Programme, it also refers to the significant related activities carried out under IAEA Technical Co-operation projects, as well as other international activities relevant to the safety of WWER and RBMK reactors. 13 figs, 9 tabs.

7654 (INIS-mf–14417) **Simulation of pressurized water reactor in accidental state.** Chakir, E. Universite Mohammed 5, Rabat (Morocco). Faculte des Sciences. 12 Apr 1994. 160p. (In French). Order Number DE95615912. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of this work is to develop the 1300 MWe 4 loops 'PWR' simulator called 'SATRAPE', witch the adopted physics modelisation allows a simplified neutronic calculation, and focus essentially on the reactor thermal hydraulic behavior in the case of the following accidents: - Loss of Coolant Accident (LOCA). - Steam Generator Tube Failure (SGTF). - Steam Line Break (SLB). In case of the 'LOCA' or 'SLB' accident, this modelisation enables the calculation of the pressure and the temperature in the containment building, and also the debit of the released dose in this latter in case of the 'LOCA' accident. The adopted models are relatively simple so as to allow an explicit resolve. In SATRAPE, two graphical interfaces enables to launch orders, whereas the other permits to visualize, the principal state variables of installations. The results obtained show a very good consistency with the envisaged commonly scenario at the time of the considered accidents. 33 refs., 52 figs., 1 tab. (author).

7655 (KAERI/RR–1222/93) **Development of standard logic network for PWR NSSS system design.** Chung, Moon Kyu (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Lee, Byeong Ryeong; Lee, Pan Kwon; Lee, Hae Joon; Park, Joon Won; Song, Tae Gil; Kim, Dong Hui; Choi, Hyeon Ho. Korea Cancer Center Hospital, Seoul (Korea, Republic of). May 1993. 19p. (In Korean). Order Number DE95612848. Source: OSTI; NTIS; INIS.

The self-reliance of NSSS System Design is required not only the design capability to perform the system design but also the management capability to control the resource and time for the Project effectively. The purpose of this study is to develop the simplified standard Logic Network that is scheduled on the time and

resource using the PERT/CPM method. That is mainly focused on Ulchin 3, 4 Project. We prepare the management tool of NSSS System Design project. And we can utilize it as a reference tool for the similar project which are complex and long term in a next project. (Author).

7656 (KAERI/RR–1224/93) **Research on the improvement of nuclear safety.** Yoo, Keon Joong (and others); Kim, Dong Soo; Kim, Hui Dong; Park, Chang Kyu. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jun 1993. 77p. (In Korean). Order Number DE95612849. Source: OSTI; NTIS; INIS.

To improve the nuclear safety, this project is divided into three areas which are the development of safety analysis technology, the development of severe accident analysis technology and the development of integrated safety assessment technology. 1. The development of safety analysis technology. The present research aims at the development of necessary technologies for nuclear safety analysis in Korea. Establishment of the safety analysis technologies enables to reduce the expenditure both by eliminating excessive conservatisms incorporated in nuclear reactor design and by increasing safety margins in operation. It also contributes to improving plant safety through realistic analyses of the Emergency Operating Procedures (EOP). 2. The development of severe accident analysis technology. By the computer codes (MELCOR and CONTAIN), the in-vessel and the ex-vessel severe accident phenomena are simulated. 3. The development of integrated safety assessment technology. In the development of integrated safety assessment techniques, the included research areas are the improvement of PSA computer codes, the basic study on the methodology for human reliability analysis (HRA) and common cause failure (CCF). For the development of the level 2 PSA computer code, the basic research for the interface between level 1 and 2 PSA, the methodology for the treatment of containment event tree are performed. Also the new technologies such as artificial intelligence, object-oriented programming techniques are used for the improvement of computer code and the assessment techniques.

7657 (KAERI/RR–1239/92) **The development of integrated safety assessment technology.** Yoo, Keon Joong (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Park, Chang Kyu; Kim, Tae Un; Han, Sang Hoon; Yang, Joon Eon; Lim, Tae Jin; Han, Jae Joo; Je, Moo Seong; An, Kwang Il; Kim, Shi Dal; Jeong, Jong Tae; Jeong, Kwang Seop; Jin, YeoKorea Cancer Center Hospital, Seoul (Korea, Republic of). May 1993. 146p. (In Korean). Order Number DE95612850. Source: OSTI; NTIS; INIS.

For the purpose of developing the integrated PSA methodology and computer codes, Level-1 and Level-2 PSA methodology and tools were reviewed and improved. The Level-1 PSA computer code package KIRAP was improved and released by the name of KIRAP Release 2.0 Several Human reliability analysis and common cause failure analysis methods was reviewed and compared. For the development of Level-2 PSA computer code, several level-1 and Level-2 interface methods and containment event tree development methods were reviewed and compared. And the new technology such as artificial intelligence was reviewed if the technology can be applied to the development of PSA methodology.(Author).

7658 (KAERI/RR–1240/92) **Development of Megawatt Demand Setter for Plant Operating Flexibility.** Kim, Se Chang (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Hah, Yeong Joon; Song, In Ho; Lee, Myeong Hun; Chang, Do Ik; Choi, Jung In. Korea Cancer Center Hospital, Seoul (Korea, Republic of). May 1993. 49p. (In Korean). Order Number DE95612851. Source: OSTI; NTIS; INIS.

The Conceptual design of the Megawatt Demand Setter (MDS) is presented for the Korean Standardized Nuclear Power Plant. The MDS is a digital supervisory limitation system. The MDS assures that the plant does not exceed the operating limits by regulating the plant operations through monitoring the operating margins of the critical parameters. MDS is aimed at increasing the operating flexibility which allow the nuclear plant to meet the grid demand in very efficient manner. It responds to the grid demand without penalizing plant availability by limiting the load demand when the operating limits are approached or violated. MDS design concepts were tested using simulation responses of Yonggwang Units 3, 4. The design of the Yonggwang Units 3, 4 would be used as a reference which designs of Korean Standardized Nuclear Power Plants would be based upon. The simulation results illustrate that the MDS can be used to improve operating flexibility. (Author).

7659 (KAERI/RR–1266/93) **Development of debris resistant bottom end piece.** Lee, Jae Kyung (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Sohn, Dong Seong; Yim, Jeong Sik; Hwang, Dae Hyun; Song, Kee Nam; Oh, Dong Seok; Rhu, Ho Sik; Lee, Chang Woo; Kim, Seong Soo; Oh, Jong Myung. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 323p. (In Korean). Order Number DE95612853. Source: OSTI; NTIS; INIS.

Debris-related fuel failures have been identified as one of the major causes of fuel failures. In order to reduce the possibility of debris-related fuel failures, it is necessary to develop Debris-Resistant Bottom End Piece. For this development, mechanical strength test and pressure drop test were performed, and the test results were analyzed. And the laser cutting, laser welding and electron beam welding technology, which were the core manufacturing technology of DRBEP, were developed. Final design were performed, and the final drawing and specifications were prepared. The prototype of DRBEP was manufactured according to the developed munufacturing procedure. (Author).

7660 (KAERI/RR–1270/93) **Development of detection technique for fatigue crack due to thermal stratification phenomena in RCS piping.** Lee, Sam Lai (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Kim, Byoung Chul; Hong, Soon Shin; Park, Chi Sung; Lee Jong Po; Chang, Kee Ok. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 127p. (In Korean). Order Number DE95612854. Source: OSTI; NTIS; INIS.

Primitive experiment was performed to make thermal fatigue specimen using Argon gas torch as a fundamental work and permanent test-loop for automatic heat-up and cool-down was designed in order to manufacture thermal fatigue specimen. As for the development of detection technique, work was performed to build up a procedure to detect and size fatigue cracks with all currently available ultrasonic testing technique using natural cracked blocks which were made during previous years. Since the final object of this project is to detect fine cracks such as fatigue cracks, one of signal processing techniques which play a great role to improve signal to noise ratio was adopted with the software that was previously developed. (Author).

7661 (KAERI/RR–1295/93) **A study on the computerization of secondary side on-line chemistry monitoring system of PWR.** Yang, Kyung Rin (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Hong, Kwang Bum; Lee, Eun Hee. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 102p. (In Korean). Order Number DE95612855. Source: OSTI; NTIS; INIS.

A computer system for on-line chemistry monitoring system located in secondary side of PWR plant is under developing. Keithley 500A Mainframe and AMM1A and AIM3A modules are used for data acquisition and scientific and engineering software package of ASYST is used for developing software program. The contents are as follows; (1) Data Acquisition and Real-Time Display. The output signals of monitoring chemical sensors are stored in PC showing real-time data display as true values and graphics. (2) Data Management and Trending Graphs. The data stored in PC are outcoming in various graphic mode for data management such as simple trending graphs screen display, time duration plot and histogram plot. (3) Daily Basis Data Manual Input. The chemical analysis data of grab sample are stored in PC by manual input for supplemental data. (4) Tabular Data Report Preparation. Summarized daily, weekly, monthly, quarterly and yearly reports are prepared with various mode of graphic display. (Author).

7662 (KAERI/RR–1296/93) **Upgrade of one-dimensional core simulator ONED90.** Chang, Jong Hwa (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Cho, Young Sik; Zee, Syung Quun; Lee, Chang Ho; Lee, Ki Bok; Cho, Young Cherl; Choi, Young Gil; Kim, Hee Kyung. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Feb 1994. 81p. (In Korean). Order Number DE95612856. Source: OSTI; NTIS; INIS.

ONED90 is a computer program to simulate the nuclear core transient in terms of operational transient. It simulates mainly xenon transient which occurs with time step of 10 to 20 minutes during 3 to 4 days. To predict core state with accuracy, the power adaptation method, control rod adaptation method are employed. After tuning initial core condition ONED90 predicts core state with great accuracy. This report describes the Nodal Expansion Method, adjoint flux calculation method, equilibrium xenon concentration calculation method to improve accuracy, and Graphic User Interface for ease of end user. This report also mentions about the verification of ONED90 against the steady and transient core state. (Author).

7663 (KAERI/RR–1303/93) **Thermal-Hydraulics of a steam discharge system.** Sim, Yoon Sub (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); So, Dong Sup; Yoo, Geun Jong; Kim, Seong Oh; Kim, Yeon Sik; Chung, Se Won; Jung, Seung Ho; Park, Jin Ho. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 135p. (In Korean). Order Number DE95612857. Source: OSTI; NTIS; INIS.

Physical characteristics of the steam discharge system of PWR, which consists of valves, piping, steam sparger, and steam accomodating tank, have been analyzed and a preliminary analysis system has been set up for development of the analysis and design methodology for the system. The work was the results of the second year research in the planned research period of four years. Analysis has been made for the characteristics of rapid transient and steady flow in the piping, steam condensation, small and hermetically sealed tank performance, bubble behavior and wall pressure oscillation in a large and open tank, coupling between wall pressure oscillation and structure vibration. Based on the analysis results, conceptual methods for controlling the hydraulic load on the wall have been devised and evaluated. (Author).

7664 (KAERI/RR–1314/93) **The development of LOCA analysis codes for nuclear power plant.** Chang, Won Pyo (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Kim, Dong Soo; Chung, Yeong Jong; Chang, Byeong Hoon; Park, Chan Eok; Guen, Tae Soon; Jeang, Jae Joon; Kim, Won Seok; Kim, Kyong Doo; Yoon, Joo Heon; Lee, Sang Yong; Chung, Beop.Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 266p. (In Korean). Order Number DE95612858. Source: OSTI; NTIS; INIS.

This research aims at assessment of the best-estimate codes, so as to develop a reliable analysis method for their actual applications. There are two additional purposes in the study: The first is the development of methodology for sizing the safety systems for advanced reactor design using the best-estimate codes, and the other is the development of our own best-estimate methodology, referring to USNRC approval of the acceptance criteria for ECCS based on the best-estimate method. The use of the best-estimate codes as those assumed in FSAR by only input arrangement, has resulted in achievement of at least 250 K safety margin. The fact that the predicted PCT in LBLOCA analysis is well bounded within the acceptance criteria using the best-estimates codes, should be verified by the quantification of the code uncertainty in the future. In the case of computer code improvement, the reflood models have been improved and satisfactory results have been obtained. In the case of uncertainty evaluation, the calculational matrices based on the assessment of experiments with the improved RELAP5 code for the quantification of the code uncertainty have been formulated separately for blowdown and reflood phases. (Author).

7665 (KAERI/RR–1316/93) **A study on the establishment of severe accident experimental facility.** Yoo, Kun Joong (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Kim, Sang Baek; Kim, In Sik; Nho, Ki Man; Bark, Rae Joon; Park, Chun Kyeong; Sim, Seok Koo; Lee, Seong Jae; Chung, Moon Ki; Cho, Yeong Ro; Chun, Shee Yeong. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 266p. (In Korean). Order Number DE95612859. Source: OSTI; NTIS; INIS.

Significant progress has been achieved during this year of the project. Planned DCH experiments on the sensitivity of the cavity geometry factors and the cavity capture volume effects were performed using the HPME facility for Kori-1/2 and YGN-3/4 cavity scale models. The Crust Formation Test Facility has been completed. Preliminary calculations were performed to predict test results. The experiments of the crust formation on the simulant and its heat transfer characteristic were performed to investigate the effects of coolant injection methods, bottom heating boundary surface temperatures, coolant temperatures and coolant flow rates. The design of the FCI Test Facility has been completed and the procurement of the materials is in progress. Also, the steam condensation experiment on the vertical containment walls and the research on the development of measuring techniques of the particle sizes and velocities are in progress as planned. Through international research collaboration with USNRC and CEA Cadarache, information of the experimental research on the severe fuel damage has been gathered and analyzed. Preliminary planning of the second phase tests has been launched this year. This study proposes the scope of the second phase and the strategy to implement the proposed second phase experimental program. This study also proposes a strategy to establish building blocks and infrastructure for the severe accident research in Korea. (Author).

7666 (WHC-SD-SNF-PTR–001) **Evaluation of storing Shippingport Core II spent blanket fuel assemblies in the T Plant PWR Core II fuel pool without active cooling.** Gilbert, E.R. (Pacific Northwest Lab., Richland, WA (United States)); Lanning, D.D.; Dana, C.M.; Hedengren, D.C. Westinghouse Hanford Co., Richland, WA (United States). Oct 1994. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004788. Source: OSTI; NTIS; INIS; GPO Dep.

PWR Core II fuel pool chiller-off test was conducted because it appeared possible that acceptable pool-water temperatures could be maintained without operating the chillers, thus saving hundreds of thousands of dollars in maintenance and replacement costs. Test results showed that the water-cooling capability is no longer needed to maintain pool temperature below 38°C (100°F).

2103 Power Reactors, Nonbreeding, Graphite Moderated

7667 (PSI–94-17) **Evaluation of the SMOLENSK-3 NPP shutdown system. Phase I: code implementation and testing. First progress report.** Saphier, D. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Hennig, D.; Knoglinger, E. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Oct 1994. 124p. Order Number DE95615943. Source: OSTI; NTIS; INIS.

The purpose of the present program is to investigate the adequacy of the existing RBMK shutdown system, with particular attention to the Smolensk-3 reactor. The program will also establish the "tools" necessary for a thorough investigation of the RBMK reactors. The elements included under the heading of "tools" include the necessary programs for steady state and transient investigations of neutronic and thermal hydraulic phenomena, methods to calculate RBMK cross-sections, a data base comprising the sufficient and necessary information on the relevant reactors and operational practices, and a detailed description of some critical experiments in order to verify the "tools" to be used in the present investigation. This report describes the first part of the study, which is outlined in detail in the Executive Summary. This includes in particular the installation of the various operational tools, verification of these tools with the Chernobyl-3 critical experiment at cold zero power, collection of the data, and preliminary analyses of the Smolensk-3 void effect in the fuel- and control rod channel at hot zero power and cold zero power conditions. The RBMK reactors are very heterogeneous and therefore a good model for this core requires a full core 3-D representation. A 3-D neutronic calculation of this large reactor is quite time consuming and consequently a 12x12 assemblies subsection (one 1/12 of the core) was also used for fast scoping studies. This 12x12 model does not provide correct absolute values but will indicate the trend of various phenomena. From the calculations performed in the present phase of the project it is obvious that the reactivity increase due to voiding the core in the improved versions of RBMK (e.g. that of Smolensk-3) is much smaller than for the older designs. (author) figs., tabs., 10 refs.

As the first year of the experimental research for the manufacturing and irradiation of prototypic DUPIC nuclear fuel, UO_2 pellets made from the natural uranium dioxide were used for the study of OREOX (oxidation/reduction of oxide fuel) process. The reference oxidation and reduction processes were established from the evaluation of the characteristics of produced powders and pellets. The manufacturing process and the layout of the manufacturing equipment were established in consideration of the high radioactivity of DUPIC process and the function of hot cells. The properties of materials to be used for DUPIC manufacturing were evaluated, and the punching machine for decladding was also developed. (Author).

It has been projected that a total of 5 pressurized heavy water reactors (PHWR) including Wolsong 1 under operation and Wolsong 2, 3 and 4 under construction will be operated by 2006, and so about 500 ton of natural uranium will be consumed every year and a lot of spent fuels will be generated. Therefore, the ultimate goal of this R and D project is to develop the CANDU advanced fuel having the following capabilities compared with existing standard fuel: (1) To reduce linear heat generation rating by more than 15% (i.e., less than 50 kW/m), (2) To extend fuel burnup by more than 3 times (i.e., higher than 21,000 MWD/MTU), and (3) To increase critical channel power by more than 5%. In accordance, the followings are performed in this fiscal year: (1) Undertake CANFLEX-NU design and thermalmechanical performance analysis, and prepare design documents, (2) Establish reactor physics analysis code system, and investigate the compativility of the CANFLEX-NU fuel with the standard 37-element fuel in the CANDU-6 reactor. (3) Establish safety analysis methodology with the assumption of the CANFLEX-NU loaded CANDU-6 reactor, and perform the preliminary thermalhydraulic and fuel behavior for the selected DBA accidents, (4) Investigate reactor physics analysis code system as pre-study for CANFLEX-SEU loaded reactors.

7670 (KAERI/RR–1326/93) **Verification tests for CANDU advanced fuel -Development of the advanced CANDU technology-.** Chung, Jang Hwan (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Suk, Ho Cheon; Jeong, Moon Ki; Park, Joo Hwan; Jeong, Heung Joon; Jeon, Ji Soo; Kim, Bok Deuk. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 171p. (In Korean). Order Number DE95612925. Source: OSTI; NTIS; INIS.

This project is underway in cooperation with AECL to develop the CANDU advanced fuel bundle (so-called, CANFLEX) which can enhance reactor safety and fuel economy in comparison with the current CANDU fuel and which can be used with natural uranium, slightly enriched uranium and other advanced fuel cycle. As the final schedule, the advanced fuel will be verified by carrying out a large scale demonstration of the bundle irradiation in a commercial CANDU reactor, and consequently will be used in the existing and future CANDU reactors in Korea. The research activities during this year Out-of-pile hydraulic tests for the prototype of CANFLEX bundle was conducted in the CANDU-hot test loop at KAERI. Thermalhydraulic analysis with the assumption of CANFLEX-NU fuel loaded in Wolsong-1 was performed by using thermalhydraulic code, and the thermal margin and T/H compatibility of CANFLEX bundle with existing fuel for CANDU-6 reactor have been evaluated. (Author).

7671 (KAERI/RR–1332/93) **Development of fabrication technology for CANDU advanced fuel -Development of the advanced CANDU technology-.** Choi, Chang Beom; Kim, Hyeong Soo; Kim, Sang Won; Seok, Ho Cheon; Shim, Ki Seop; Byeon, Taek Sang; Jang, Ho Il; Kim, Sang Sik; Choi, Il Kwon; Cho, Dae Sik; Sheo, Seung Won; Lee, Soo Cheol; Kim, Yoon Hoi; Park, Choon Ho; Jeong, Seong Hoon; Kang, Myeong Soo;Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 318p. (In Korean). Order Number DE95612926. Source: OSTI; NTIS; INIS.

The present study is to develop the advanced CANDU fuel fabrication technologies by means of applying the R and D results and experiences gained from localization of mass production technologies of CANDU fuels. The annual portion of this year study includes following: 1. manufacturing of demo-fuel bundles for out-of-pile testing 2. development of technologies for the fabrication and inspection of advanced fuels 3. design and munufacturing of fuel fabrication facilities 4. performance of fundamental studies related to the development of advanced fuel fabrication technology.

7672 (KAERI/RR–1344/93) **DUPIC facility engineering -A study on the direct use of spent PWR fuel in CANDU reactors-.** Park, Hyun Soo (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Lee, Jae Seol; Kim, Ho Dong; Song, Ki Chan; Choi, Jong Won; Yoon, Ji Seop; Jeon, Yong Beom; Seo, Ki Seok; Lee, Han Myeong; Moon, Ki Hwan; Lim, Chang Saeng. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Aug 1993. 276p. (In Korean). Order Number DE95612927. Source: OSTI; NTIS; INIS.

The applicability of KAERI facilities (PIEF for disassembly)cutting of spent PWR fuel and post irradiation examination of DUPIC fuel, IMEF for DUPIC fuel fabrication, KMRR for irradiation of DUPIC fuel and RWTF for radwaste treatment and storage, which would be usable for performing the Phase II of DUPIC 'Experimental Verification' was reviewed from the standpoint of system engineering. The engineering parameters for refurbishments of IMEF M6 cell to be applied for DUPIC fuel fabrication are also reviewed and some transportation casks to move samples and specimens between the facilities were reviewed. The reference fuel was established from the characteristics of spent PWR fuel out of nuclear power plant. Based on the balance of fuel, the balance of fuel material was evaluated qualitatively between DUPIC and once-through cycle, and the preliminary economic analysis between two cycles was performed. The spent fuel arising and the environmental safety were also evaluated. Cooperative actions for the Phase II of DUPIC being implemented on a tripartite frame between Korea-Canada-U.S.A and a brief survey on the prospectives of applying the DUPIC fuel cycle concept on global level were touched upon. (Author).

7673 (KAERI/RR–1377/93) **Development of advanced CANDU PHWR -Development of the advanced CANDU technology-.** Seok, Ho Cheon; Na, Yeong Hwan; Seok, Soo Dong; Lee, Bo Uk; Kwak, Ho Sang; Kim, Bong Ki; Kim, Seok Nam; Min, Byeong Joo; Park, Jong Ryunl; Shin, Jeong Cheol; Lee, Kyeong Ho; Lee, Dae Hee; Lee, Deuk Soo; Lee, Yeong Uk; Lee, Jeong Yang; Jwon, Jong Seon; JwonKorea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 541p. (In Korean). Order Number DE95612929. Source: OSTI; NTIS; INIS.

The target of this project is to assess the feasibility of improving PHWR and to establish the parameter of the improved concept and requirements for developing it. To set up the requirements for the Improved Pressurized Heavy Water Reactor: (1) Design requirements of PHWR main systems and Safety Design Regulatory Requirements for Safety Related System i.e. Reactor Shutdown System, Emergency Core Cooling System and Containment System were prepared. (2) Licensing Basis Documents were summarized and Safety Analysis Regulatory. Requirements were reviewed and analyzed. To estimate the feasibility of improving PHWR and to establish the main parameters of the concept of new PHWR in future: (1) technical level/developing trend of PHWR in

Korea through Wolsong 2, 3 and 4 design experience and Technical Transfer Program was investigated to analyze the state of basic technology and PHWR improvement potential. (2) CANDU 6 design improvement tendency, CANDU 3 design concept and CANDU 9 development state in other country was analyzed. (3) design improvement items to apply to the reactors after Wolsong 2, 3 and 4 were selected and Plant Design Requirements and Conceptual Design Description were prepared and the viability of improved HWR was estimated by analyzing economics, performance and safety. (4) PHWR technology improving research and development plan was established and international joint study initiated for main design improvement items.

7674 (ANL/ET/CP–84795) **Status of the solid breeder materials database.** Billone, M.C. (Argonne National Lab., IL (United States)); Dienst, W.; Lorenzetto, P.; Noda, K.; Roux, N. Argonne National Lab., IL (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9406171–4: 3. international workshop on ceramic breeder blanket interactions, Los Angeles, CA (United States), 22-24 Jun 1994). Order Number DE95004628. Source: OSTI; NTIS; INIS; GPO Dep.

The databases for solid breeder ceramics (Li_2O, Li_4SiO_4, Li_2ZrO_3, and $LiAlO_2$) and beryllium multiplier material were critically reviewed and evaluated as part of the ITER/CDA design effort (1988-1990). The results have been documented in a detailed technical report. Emphasis was placed on the physical, thermal, mechanical, chemical stability/compatibility, tritium retention/release, and radiation stability properties which are needed to assess the performance of these materials in a fusion reactor environment. Materials properties correlations were selected for use in design analysis, and ranges for input parameters (e.g., temperature, porosity, etc.) were established. Also, areas for future research and development in blanket materials technology were highlighted and prioritized. For Li_2O, the most significant increase in the database has come in the area of tritium retention as a function of operating temperature and purge flow composition. The database for postirradiation inventory from purged in-reactor samples has increased from four points to 20 points. These new data have allowed an improvement in understanding and modeling, as well as better interpretation of the results of laboratory annealing studies on unirradiated and irradiated material. In the case of Li_2ZrO_3, relatively little data were available on the sensitivity of the mechanical properties of this ternary ceramic to microstructure and moisture content. The increase in the database for this material has allowed not only better characterization of its properties, but also optimization of fabrication parameters to improve its performance. Some additional data are also available for the other two ternary ceramics to aid in the characterization of their performance. In particular, the thermal performance of these materials, as well as beryllium, in packed-bed form has been measured and characterized.

7675 (ANL/ET/CP–84844) **Progress in tritium retention and release modeling for ceramic breeders.** Raffray, A.R. (ITER Joint Work Site, Garching (Germany)); Federici, G.; Billone, M.C.; Tanaka, S. Argonne National Lab., IL (United States). 11 Jul 1994. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940664–35: ISFNT-3: 3rd international symposium on fusion nuclear technology, Los Angeles, CA (United States), 27 Jun - 1 jul 1994). Order Number DE95004627. Source: OSTI; NTIS; INIS; GPO Dep.

Tritium behavior in ceramic breeder blankets is a key design issue for this class of blanket because of its impact on safety and fuel self-sufficiency. Over the past 10-15 years, substantial theoretical and experimental efforts have been dedicated world-wide to develop a better understanding of tritium transport in ceramic breeders. Models that are available today seem to cover reasonably well all the key physical transport and trapping mechanisms. They have allowed for reasonable interpretation and reproduction of experimental data and have helped in pointing out deficiencies in material property data base, in providing guidance for future experiments, and in analyzing blanket tritium behavior. This paper highlights the progress in tritium modeling over the last decade. Key tritium transport mechanisms are briefly described along with the more recent and sophisticated models developed to help understand them. Recent experimental data are highlighted and model calibration and validation discussed. Finally, example applications to blanket cases are shown as illustration of progress in the prediction of ceramic breeder blanket tritium inventory.

7676 (IAEA-TECDOC–766, pp. 77-85) **Civil plutonium handling experience in the production of fuel, fuel elements and assemblies for fast reactors.** Skiba, O.V. (Research Inst. of Atomic Reactors, Dimitrovgrad (Russian Federation)); Mayorshin, A.A.; Porodnov, P.T.; Kisly, V.A.; Kirillovich, A.P.; Ovsyannikov, Y.F.; Keruchenko, S.S. International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310405–: Technical committee meeting on safe handling, transport and storage of plutonium, Vienna (Austria), 18-21 Oct 1993). In *Safe handling, transport and storage of plutonium. Proceedings of a technical committee meeting held in Vienna, 18-21 October 1993.* 120p. Order Number DE95614900. Source: OSTI; NTIS (US Sales Only); INIS.

Work on integrating plutonium into the nuclear fuel cycle has been underway since the mid-1970s. This work is the first stage of implementing the closed fuel cycle. Unlike the traditional technologies of fuel cycle, based on aqueous fuel reprocessing and fuel element manufacture with a compact pellet column, the fuel cycle at RIAR is based on "dry" methods of fuel reprocessing and on the fuel element manufacture by means of vibropacking. In the last 15 years there was a wide scope of investigations of fast reactor fuel cycles. In the process of these investigations, experience was gained in both the problem of providing safe initiation of civil plutonium into the fast reactor's fuel cycle and in operation of pilot facilities for remote manufacture of granulated fuel, fuel elements and assemblies. The automated, remotely controlled, pilot facilities complex at RIAR was located in shielded chambers and was capable of producing 40-50 fuel assemblies of the BOR-60 reactor per year. In the course of experimental operation from 1977 to 1986, there were produced about 2 tonnes of granulated fuel containing 1 tonne of Pu of different isotopic compositions and origins. More than 11 thousand fuel elements (300 fuel assemblies) were manufactured for BOR-60. The experience and knowledge gained in this operation was the basis for redesign of the pilot facilities complex, using the existing shielded chambers and remote servicing means to produce U-Pu oxide fuel, fuel elements and fuel assemblies for the BN 600 fast power reactors. Pilot research complex operation was started in 1989 and 26 fuel assemblies for BN-type reactors have been produced so far. The available capacity of fuel reprocessing, fuel elements and assemblies manufacture allow about 40 fuel assemblies to be produced per year for fast power reactors. (author). 10 refs, 5 figs.

7677 (KAERI/RR–1228/92) **Liquid metal reactor development.** Cho, Man; Kim, Yeong Cheol; Kim, Shi Hwan; Choi, Yeong Myeong; Sho, Dong Seop; Kim, Yeong In; Park, Joo Hwan; Kim, Yeong Kyoon; Song, Hoon; Kim, Yeong In; Cho, Chang Yeon; Cho, Seok Hong; Lee, Dong Jin; Kim, Jong Sook; Jeon, Hyeong Ryeon; Kim, Jeong Do; KiKorea Cancer Center Hospital, Seoul (Korea, Republic of). On this year the study was performed in two parts : The establishment of LMR development plan, and the development of LMR coolant technology 1. The establishment of LMR technologies, the domestic political and technical environment, economics and technical maturity were duly considered for comparative analysis. In this year technologies specific to LMRs and technologies common to both PWRs and LMRs were identified to understand the inter-relationships between those two categorized technologies. Including those two categories, an overall LMR technology tree was drawn up taking into consideration technologies and tasks necessary to the pool type design of the primary and secondary cooling systems. And technology options that should be thoroughly evaluated their comparative feasibilities and applicabilities in trade-off study were derived as a preliminary procedure for the selection of the reactor type. 2. The development of LMR coolant technology.

Many relevant basic technologies should be developed for LMR to have the inherent safety characteristics and to be economical. Since the sodium(Na) being used as the coolant in LMR has several thermo-hydraulic characteristics differing from water, the sodium handling technique which provides the maximum utilization of the thermo-hydraulic merits of the sodium and the protection measures against its defects is one of the most important technologies for the development of LMR. In the present study many problems associated with the establishment of the technology for measuring and controlling the impurity in the Na-facility have been investigated. The conceptual design of the purity control system in the Na-facility and related purity control system have been also made. The test-run of the Na-loop facility constructed last year has been performed, which provided the technology necessary for operation and repair of the Na-facility.

7678 (KAERI/RR–1378/93) **A study on the safety measures of LMR coolant -Liquid metal reactor development-.** Hwang, Sung Tai (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Choi, Yun Dong; Kwon, Seon Kil; Cho, Byeong Ryeol; Kim, Kwang Rak; Kwon, Sang Un; Kim, Byeong Ho; Jeong, Ji Yeong; An, Seon Soo; Park, Jin Ho; Choi, Jong Hyeon; Kim, Tae Joon; JKorea Cancer Center Hospital, Seoul (Korea, Republic of). A study on safety measures of LMR coolant showed the results as follows ; 1. LMR coolant safety measure: (1) Peak gas pressure decreases significantly when the droplet diameter is increased, but peak gas pressure increases with initial oxygen concentration, sodium quantity and sodium temperature. (2) The surface combustion model was used for the analysis of sodium pool fire in a test vessel. It was turned out that this model showed the over estimation results about the combustion rate and sodium temperature in comparison with experimental results. 2. Sodium fire aerosol characteristics: (1) Aerodynamic mean diameter decrease according to increase of measuring times, injection temperature and injection pressures. (2) Combined sodium fire aerosols and spray fire aerosols are classified the same from the point view of aerosol characteristics. 3. Sodium purification technology: (1) The major design parameters of the cold trap are cooling method, trapping temperature, residence time and flow rate. A residence time of 3-5 min and a flow rate of 1-20 g/min are desirably accepted by cold trap designers. (2) The important factors for design and performance of plugging meter are size and type of flow restrictor, sodium flow rate, cooling rate. 4. The characteristics of sodium-water reaction: (1) The investigations for characteristics of sodium-water reaction and leak detection, and the construction of hydrogen detector.

7680 Electrical insulator assembly with oxygen permeation barrier. Van Der Beck, R.R.; Bond, J.A. To Dept. of Energy. 1992. Filed date 12 Nov 1992. U.S. Patent Application 7-989,609. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-86SF16006. Order Number DE95006116. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Disclosed is a high-voltage electrical insulator for electrically insulating a thermoelectric module in a spacecraft from a niobium-l% zirconium alloy wall of a heat exchanger filled with liquid lithium while providing good thermal conductivity between the heat exchanger and the thermoelectric module. The insulator has a single crystal alumina layer (S x Al_2O_3, sapphire) with a niobium foil layer bonded thereto on the surface of the alumina crystal facing the heat exchanger wall, and a molybdenum layer bonded to the niobium layer to act as an oxygen permeation barrier to preclude the oxygen depleting effects of the lithium from causing undesirable niobium-aluminum intermetallic layers near the alumina-niobium interface.

This compilation consists of bibliographic data and abstracts for the formal regulatory and technical reports issues by the U.S. Nuclear Regulatory Commission (NRC) Staff and its contractors. It is NRC's intention to publish this compilation quarterly and to cumulate it annually. The main citations and abstracts in this compilation are listed in NUREG number order: NUREG-XXXX, NUREG/CP-XXXX, NUREG/CR-XXXX, and NUREG/IA-XXXX. These precede the following indexes: Secondary Report Number Index, Personal Author Index, Subject Index, NRC Originating Organization Index (Staff Reports), NRC Originating Organization Index (International Agreements), NRC Contract Sponsor Index (Contractor Reports) Contractor Index, International Organization Index, Licensed Facility Index. A detailed explanation of the entries precedes each index.

7682 (NUREG–1100-Vol.11) **Budget estimates - fiscal years 1996-1997.** Nuclear Regulatory Commission, Washington, DC (United States). Feb 1995. 197p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

The U.S. Congress has determined that the safe use of nuclear materials for peaceful purposes is a legitimate and important national goal. It has entrusted the NRC with the primary Federal responsibility for achieving that goal. The NRC's mission, therefore, is to ensure adequate protection for the public health and safety, the common defense and security, and the environment in the use of nuclear materials in the United States. The NRC's scope of responsibility includes regulation of commercial nuclear power plants; research, test, and training reactors; fuel cycle facilities; medical, academic, and industrial uses of nuclear materials; and the transport, storage, and disposal of nuclear materials and wastes. The NRC carries out its mission by setting standards and requirements that licensees must meet to design, construct, and operate safe facilities, in the form of rules, license conditions, and regulatory guidance; inspecting facilities and taking enforcement action, as necessary, to ensure that such standards are followed; and conducting research to support, confirm, or refine judgments used in regulatory decisions. The technologies involved in the use of nuclear energy are relatively new and complex. Regulatory decisions often require conservatism to account for technical uncertainty. Conservatisms should be modified appropriately as increased understanding of physical phenomena and interactions is achieved. Further, essential functions must be maintained through appropriate combinations of high component and system reliability, redundancy, and diversity to provide multiple barriers to the release of radiation (defense-in-depth).

7683 (KAERI/RR–1345/93) **Fuel management and safety analysis -A study on the direct use of spent PWR fuel in CANDU reactors-.** Rhee, Bo Wook (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Choi, Hang Bok; Kim, Bong Gi;

Lee, Young Ook; Chung, Chang Joon; Hwang, Wan; Kim, Il Kon; Cho, Jae Seon; Park, Chang Jae; Huh, Chang Uk. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 144p. (In Korean). Order Number DE95612928. Source: OSTI; NTIS; INIS.

From the previous year research, it was expected that power pulse during LOCA for CANDU loaded with DUPIC fuel be steeper and higher than that for the CANDU loaded with natural uranium fuel. As a potential resolution to this concern, a fuel bundle concept was proposed composed of fuel pins of 35,000 MWD/TU DUPIC fuel composition, except the center pin mixed with burnable poison called DY-164. In addition to this center pin poisoning, lowering the total fissile isotopes in inner ring pins than that of the DUPIC fuel composition of 35,000 MWD/TU PWR burnup should enhance the reduction of positive reactivity insertion under half core voiding and raising the total amount of fissile isotopes in outer ring pins to minimize the burnup penalty due to burnable poison. Major outcome of this year research was (1) identification of the amount of DY-164 needed to keep the peak reactor power during LOCA at the same level as a natural uranium fuelled core. (2) the calculation of the power distribution in the bundle and the core and the comparison of the maximum channel and bundle powers for individual fuel options with those of the natural uranium CANDU-6 core. It is found that the maximum powers of DUPIC fuel options are several % lower than those and operation limits of Wolsung-2. However, it did not account for the uncertainty in nuclear design calculation caused by applying the analysis tools and cross section library not yet validated for DUPIC application and the inhomogeneity and measurement uncertainty in the fissile isotopes and fission products in the DUPIC pellet. For the start of basic design of the DUPIC fuel fabrication facilities, off-gas trapping and treatment system, the safeguards systems, basic composition of DUPIC test fuel bundle is necessary. Thus a best choice was made among the 3 fuel composition options investigated based on assessing various aspects such as core power distribution, etc.

7685 (JINR–5-62-93) **JINR rapid communications. Collection 5.** Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 73p. (In English, Russian). Order Number DE95615834. Source: OSTI; NTIS (US Sales Only); INIS.

Recent results of research and development at JINR are presented in six contributions covering feasibility studies of electro nuclides energy generation; multichannel time-of-flight and silicon tracking detector systems; dibaryon structure studies and the application of reactor-parallel computers for solving the eigenvalue problem for integral equations.

7686 (KAERI/RR–1323/93) **Thermal hydraulic tests for reactor safety system -Research on the improvement of nuclear safety-.** Chung, Moon Ki (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Park, Chun Kyeong; Yang, Seon Kyu; Chung, Chang Hwan; Chun, Shee Yeong; Song, Cheol Hwa; Chun, Hyeong Gil; Chang, Seok Kyu; Chung, Heung Joon; Won, Soon Yeon; Cho, Yeong Ro; Kim,Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 298p. (In Korean). Order Number DE95612787. Source: OSTI; NTIS; INIS.

The present research aims at the development of the thermal hydraulic verification test technology for the reactor safety system of the conventional and advanced nuclear power plant and the development of the advanced thermal hydraulic measuring techniques. (Author).

2201 Theory and Calculation

Refer also to citation(s) 7667, 7765, 9135, 9136

7687 (DTU-AEF-NT–12) **Improvements in a four factor formula recipe for lattice calculations.** Oelgaard, P.L. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Elektrofysik. Dec 1994. 34p. Order Number DE95615835. Source: OSTI; NTIS; INIS.

In reactor physics courses and standard text books the four factor formula and two group theory is often used to demonstrate to the students the physical processes in the chain reaction of nuclear reactors. When compared with measurements, in particular of light water reactors, the agreement between these simple recipes and measurements is not very good. In this report it has been investigated whether it is possible to introduce some relative simple modifications to such a recipe in order to obtain better agreement between theory and measurements. The modifications considered were: (1) The introduction of the Westcott rs-term. (2) An improved model for the fast fission factor ϵ. (3) An improved model for the slowing-down length L_s. (4) The introduction of a Dancoff correction in the calculation of the resonance escape probability p. (5) An improved model for the neutron temperature of the fuel. With these modifications the agreement between measurements and calculations of light water, slightly enriched uranium metal rod lattices was greatly improved. However, it is necessary to consider more, different lattices in order to evaluate the general validity of these apparent recipe improvements. (au).

7688 (FEI–2298) **Combined calculation of in-pile experimental devices by the Monte Carlo method.** Leont'ev, V.V.; Polevoj, V.B. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1992. 12p. (In Russian). Order Number DE95612790. Source: OSTI; NTIS (US Sales Only); INIS.

Monte Carlo coupled calculations are used for modelling functionals of neutron flux in the research reactor experimental devices. On the first step, the device is replaced by black body (BB) and the surface source is obtained by interrupting each neutron path having crossed BB. On the second step, BB is replaced by the device and the coupled transport problem is then solved with stored neutrons as a source. The method is realized on the basis of the MMKFK code system. 16 refs.; 2 figs.

7689 (INIS-mf–14437-Vol.1) **Vol. 1: Selected chapters in reactor theory.** Bezpecnost Jadernych Zarizeni, no.4. Matejka, K. (ed.) (Ceske Vysoke Uceni Technicke, Prague (Czech Republic). Fakulta Jaderna a Fysikalne Inzenyrska); Fleischhans, J.; Hejzlar, R. No corporate text available. Jun 1994. 449p. (In Czech). Order Number DE95615836. Source: OSTI; NTIS (US Sales Only); INIS.

Basic principles of nuclear reactors are explained. Nuclear and neutron physics fundamentals are outlined, including the atomic structure theory, radioactivity, and nuclear reactions. The reactor physics text concentrates on the neutron balance of the fission chain reaction, neutron diffusion, neutron moderation, nuclear reactor theory, the reactor in the steady state and in operating conditions, and nuclear reactor shielding. Nuclear reactor dynamics is described. The treatment of the research reactor thermohydraulics is focused on the generation of heat in the reactor, heat convection in the fuel elements, heat transfer, temperature distribution in the fuel channel, and reactor core hydrodynamics. Emergency reactor analyses are also dealt with. The text is adapted to the study of research and experimental reactors. (J.B.). 3 tabs., 36 figs., 10 refs.

7690 (KAERI/RR–1265/93) **Thermal-hydraulic characteristics of safety systems in advanced reactors Part 1. Heat transfer in passive containment cooling system. Part 2. Fluid mixing with safety injection.** Cha, Jong Hee (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Chung, Moon Ki; Won, Soon Yeun; Jun, Hyung Gil. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 138p. (In Korean). Order Number DE95612791. Source: OSTI; NTIS; INIS.

The heat transfer rates that occur inside and outside surfaces of the passive containment cooling system with both dry and wet outer containment surface following a postulated accident were investigated. The test model represented a 60 section of a containment vessel based on the AP600 geometry. In part 2, the

comparitive study between AP600 DVI and ABB-CE System 80+ was carried out with experimental methods. And the effects of deflector were investigated. (Author).

7691 (FEI–2231) **Program for calculation of two-dimensional nonstationary temperature fields in NPP arbitrary geometrical element.** Shimanskaya, T.M.; Shimanskij, A.A.; Chernikova, T.V. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1992. 28p. (In Russian). Order Number DE95612796. Source: OSTI; NTIS (US Sales Only); INIS.

The MRIYA program developed for calculation of transient one-ore two-dimensional temperature fields in any part of a nuclear power plant is described. The program efficiency is achieved by including the universal geometrical block and using the implicit Euler method in the thermal dynamics mathematical model differential equations system integration. The system integration is based on fast LU-decomposition algorithm for sparse system of equations solution. 9 refs.; 8 figs.; 4 tabs.

7692 (KAERI/RR–1267/93) **A study on the change in dynamic characteristics of reactor internals.** Kim, Tae Ryong (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Jung, Seung Ho; Park, Jin Ho; Park, Jin Suk; Jeong, Keong Hoon. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 142p. (In Korean). Order Number DE95612797. Source: OSTI; NTIS; INIS.

An experimental and analytical studies were performed to establish the relationship between in-air dynamic characteristics of reactor internals and in-water ones by using a scaled-down model which consists of CSB (flexible) and RPV (rigid) models. The experimental results show that the natural frequencies of the CSB model in water are remarkably lowered than those in air, and the normalized natural frequency (in-water frequency/in-air frequency) of the CSB model exists between in-phase mode and out-of-phase mode values of the flexible-to-flexible co-axial cylindrical structure which has the same dimensions as the scaled-down model. The normalized frequency increases to asymptotically reach the in-phase mode frequency of the flexible co-axial cylindrical structure as circumferential mode number (n) increases, while decreases to come near of the out-of-phase mode value as the circumferential mode number decreases. The support condition change for the CSB model in waster made the frequency of 1st axial mode (pure beam mode) shifted into lower value without any effect on the other modes. The changing trend of the natural frequencies and the mode shapes resulted from the finite element analysis by using the ANSYS code shows good agreement with the experimental results both in air and in water cases. In addition, a theoretical study was also performed by simplifying the scaled-down model as flexible-to-rigid co-axial cylindrical structure. It is found that the in-air natural frequencies shows good agreement with both the experimental and finite element analysis results, while the in-water frequencies reveals rather discrepancies. (Author).

7693 (KAERI/RR–1283/93) **A study on the thermal and mechanical properties of inconel for steam generator U-tube.** Ryu, Woo Seong (Korea Atomic Energy Res. inst., Taejon (Korea, Republic of)); Kang, Young Hwan; Park, Jong Man; Choo, Kee Nam; Kim, Sung Soo; Maeng, Wan Young; Park, Se Jin. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 136p. (In Korean). Order Number DE95612798. Source: OSTI; NTIS; INIS.

A series of laboratory tests was conducted to obtain the thermal and mechanical properties of Inconel 600 and 690 for the design document of steam generator U-tube. The following properties were measured as a function of temperature, and treated statistically to establish a database: (1) heat capacity, RT $\approx$ 500 deg C, (2) thermal expansion, RT $\approx$ 500 deg C, (3) thermal diffusivity, RT $\approx$ 500 deg C, (4) thermal conductivity, RT $\approx$ 500 deg C, (5) tensile property, RT $\approx$ 700 deg C (6) ductility, RT $\approx$ 700 deg C, (7) Elastic modulii and Poission's ratio, RT, (8) Microhardness, (9) Oxidation rate. (Author).

7694 (KAERI/RR–1293/93) **A preliminary study for the life extension of nuclear power plants.** Kim, Uh Chul (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Chung, Han Sub; Kim, Hong Pyo; Lee, Eun Hee; Hwang, Seong Sik; Hur, Do Haeng. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 110p. (In Korean). Order Number DE95612799. Source: OSTI; NTIS; INIS.

Steam generator tubings of a nuclear power plant are very thin to have efficient heat exchange. Steam generator tubings have experienced various types of corrosion damages under the sludge pile and in the tube-tube sheet crevice during operation at high temperature and high pressure. Types of degradation of steam generator tubings found in domestic nuclear power plants are pitting, secondary side stress corrosion cracking caused by Pb, primary water SCC, and fretting in the area in contact with antivibration bar. The ACPD (Alternate Current Potential Drop), which can detect the initiation and propagation of the microcracks, was assembled. The C-ring specimens were machined in order to test a stress corrosion cracking in Pb containing aqueous solution. The denting (stress increasing factor) test on the carbon steel was conducted, and pitting resistance of the different alloy was evaluated. As a result of the chemical cleaning process, it is concluded that the high temperature (125 deg C) chemical cleaning process could be applicable. And it was investigated that there were many cases of cracking of high strength materials used in the reactor internals throughout world. There was a failure in Korea also. (Author).

7695 (KAERI/RR–1299/93) **Intelligent control and automation technology for nuclear applications.** Kim, Jae Hee (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Kim, Ko Ryeo; Lee, Jae Cheol; Eom, Heung Seop; Lee, Jang Soo. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jan 1994. 112p. (In Korean). Order Number DE95612684. Source: OSTI; NTIS; INIS.

Using recently established intelligent mobile robot theory and high technologies in computer science, we have designed an inspection automation system for welded parts of the reactor vessel, and we intend to establish basic technologies. The recent status of those technologies is surveyed for various application areas, and the characteristics and availability of those techniques such as intelligent mobile robot, digital computer control, intelligent user interface, realtime data processing, ultrasonic signal processing, intelligent user interface, intelligent defect recognition, are studied and examined at first. The high performance and compact size inspection system is designed, and if implemented, it is expected to be very efficient in economic point of view. In addition, the use of integrated SW system leads to the reduction of human errors. Through the analysis results and experiences, we investigated the further feasibility of basic technology applications to the various similar operation systems in NPP. (Author).

7696 (KAERI/RR–1307/93) **Development of fatigue monitoring system in nuclear power plants.** Yoo, Bong (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Kim, Jong In; Lee, Jae Han; Lee, Hyeong Yeon; Kim, Jong Bum; Kim, Yong Wan; Koo, Kyong Hoe. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Mar 1994. 179p. (In Korean). Order Number DE95612800. Source: OSTI; NTIS; INIS.

The direct stress analysis method used for the fatigue analysis was proven to be effective and straight forward in application to fatigue monitoring system in nuclear power plants. The stress intensity factor obtained from the method using Green's function and Duhamel's integration have shown good agreement with those evaluated by the standard finite element analysis and will be used for the crack monitoring system. The fatigue monitoring program of K-FAMS was applied to YGN unit 1 surge line in heat up field operation and verified the application to a nuclear power plant. The real time fatigue monitoring system can give an important information on the life extension of the existing plants as well as the design improvement of the next power plants. (Author).

7697 (WSRC-MS–94-0632) **Residual Stress Measurements with Laser Speckle Correlation Interferometry and Local Heat Treating.** Pechersky, M.J. (Westinghouse Savannah River Company, SC (United States)); Miller, R.F.; Vikram, C.S. Westinghouse Savannah River Co., Aiken, SC (United States). 6 Jan 1994. 26p.

Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950226–3: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95060082. Source: OSTI; NTIS; GPO Dep.

A new experimental technique has been devised to measure residual stresses in ductile materials with a combination of laser speckle pattern interferometry and spot heating. The speckle pattern interferometer measures in-plane deformations while the heating provides for very localized stress relief. The residual stresses are determined by the amount of strain that is measured subsequent to the heating and cool-down of the region being interrogated. A simple lumped parameter model is presented to provide a description of the method. This description is followed by presentations of the results of finite element analyses and experimental results with uniaxial test specimens. Excellent agreement between the experiments and the computer analyses were obtained.

7698 (ANL/TD/CP–85108) **Comparison of irradiation behavior of different uranium silicide dispersion fuel element designs.** Hofman, G.L.; Rest, J.; Snelgrove, J.L. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409107–6: International meeting on reduced enrichment for research and test reactors, Williamsburg, VA (United States), 18-22 Sep 1994). Order Number DE95004584. Source: OSTI; NTIS; INIS; GPO Dep.

Calculations of fuel swelling of U_3SiAl-Al and U_3Si_2 were performed for various dispersion fuel element designs. Breakaway swelling criteria in the form of critical fuel volume fractions were derived with data obtained from U_3SiAl-Al plate irradiations. The results of the analysis show that rod-type elements remain well below the pillowing threshold. However, tubular fuel elements, which behave essentially like plates, will likely develop pillows or blisters at around 90% ^{235}U burnup. The U_3Si_2-Al compounds demonstrate stable swelling behavior throughout the entire burnup range for all fuel element designs.

7699 (FEI–2217) **Technique for calculating temperature conditions for fuel elements with bilateral heat removal taking into account axial heat fluxes.** Boltenko, Eh.A.; Ganina, S.M.; Zinina, G.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1992. 22p. (In Russian). Order Number DE95612810. Source: OSTI; NTIS (US Sales Only); INIS.

The technique for calculating a fuel element with bilateral heat generation taking into account axial heat fluxes is described. Some results of numerical investigations of fuel element temperature behavior under different coolant flow schemes and when varying operating parameters, fuel element thickness and its thermal conductivity coefficient are presented. It is demonstrated that the effect of axial heat fluxes on heat removal zone redistribution and fuel element temperature conditions respectively enchances with increasing the fuel element thickness and on thermal conductivity coefficient. 5 refs.; 11 figs.; 1 tab.

7700 (FEI–2238) **Constant system for by-channel thermal-hydraulic calculation of fuel assembly operational conditions in reactors with natural and mixed convection.** Bogatyrev, I.L.; Bogoslovskaya, G.P.; Zhukov, A.V.; Sorokin, A.P.; Titov, P.A. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1992. 37p. (In Russian). Order Number DE95612811. Source: OSTI; NTIS (US Sales Only); INIS.

System of constants for mass, impulse and energy conservation equations (drag, mixing, heat transfer coefficients, azimuthal unquality of temperature) is reported in region with small Re number for wide range of geometrical assembly parameters. This system can be used in subchannel calculations of assemblies with natural and mixed convection under conditions with loss of flow accident. The formulae are compared with experimental data. 30 refs.; 12 figs.; 1 tab.

7701 (FEI–2240) **Numerical analysis of nonstationary temperature fields in central zones of nuclear reactor fuel assemblies.** Mikhin, V.I.; Fetisova, L.N. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1992. 22p. (In Russian). Order Number DE95612812. Source: OSTI; NTIS (US Sales Only); INIS.

In order to develop approaches to generalization of the nonstationary heat exchange data and to obtain the approximate thermal-model-testing criteria the numerical investigations of the nonstationary temperature patterns in the central zones of the nuclear reactor fuel assemblies are performed. The fuel assemblies of fast and water-cooled reactors with the different fuel compositions are investigated. The temperature patterns are found for instantaneous change in energy release and for steady coolant flow. 4 refs.; 11 figs.; 1 tab.

7702 (IAEA-TECDOC–766) **Safe handling, transport and storage of plutonium. Proceedings of a technical committee meeting held in Vienna, 18-21 October 1993.** International Atomic Energy Agency, Vienna (Austria). Oct 1994. 120p. (CONF-9310405–: Technical committee meeting on safe handling, transport and storage of plutonium, Vienna (Austria), 18-21 Oct 1993). Order Number DE95614900. Source: OSTI; NTIS (US Sales Only); INIS.

Plutonium inventories and utilization rates worldwide are growing. It is important for nuclear power programmes everywhere that no incidents or accidents with plutonium occur. It is therefore important that all who deal with plutonium, do so safely. All those who deal with plutonium should have available the best information on safety handling and storage. Several countries have mature plutonium programmes. However, information exchange on plutonium has been limited. This has precluded the development until now of consensus documentation on safe handling and storage of plutonium. The Technical Committee has been established to address these problems and this Technical Document is the first product in this process. The purpose of the meeting was to bring together experts with significant experience in handling, transporting and storing plutonium; to exchange information and experiences dealing with plutonium at their facilities; to describe their practices (guidelines, procedures, regulations, etc.) for safely dealing with plutonium; to assess the need to develop and publish a consensus plutonium safety practices document(s), and to recommend possible future IAEA activities in this technical area. Refs, figs and tabs.

7703 (IAEA-TECDOC–766, pp. 11-19) **Some safety aspects related to MOX fuel fabrication in Belgium.** Canck, H. de (Belgonucleaire, Arendonk (Belgium). DECA Consulting). International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310405–: Technical committee meeting on safe handling, transport and storage of plutonium, Vienna (Austria), 18-21 Oct 1993). In *Safe handling, transport and storage of plutonium. Proceedings of a technical committee meeting held in Vienna, 18-21 October 1993.* 120p. Order Number DE95614900. Source: OSTI; NTIS (US Sales Only); INIS.

The demand for MOX fuel is high, leading Belgonucleaire to plan an expansion to the MOX fabrication facility from the present annual throughput of 35 t HM to 70-75 t HM by the end of the century. The plutonium isotopic composition has changed over time with more ^{238}Pu and ^{241}Pu arising from higher burnup fuels. Greater heat, neutron, and gamma/xray shielding problems result. Radiation exposure protection for plant personnel is made more difficult: by stricter ICRP standards, from increased radiation weighting factors for neutrons, by changing isotopics of plutonium loadings in fuel. Programmes are being implemented to limit individual maximum dose to less than 20 mSv/year and to lower the mean dose to 5 mSv/year. These limits are being approached. Safety is continuously practiced with special efforts to avoid criticality and accidents - personnel information and training is most important. (author). 4 figs, 3 tabs.

Goal is to develop nuclear fuels which can improve the safety and economics of nuclear power generation and enhance the effective use of uranium resources. The fuels are aimed for successive power plants after the year 2000. To achieve these goals, it is necessary to analyse characteristics of advanced concept fuels based on currently available fuel design and manufacturing technology and to establish new design and manufacturing technology for the new concept fuels. This first year of the project focused on 1) technical feasibility evaluation of application of existing technology to advanced concept fuel such as extra-high BU fuel or other improved feature fuel, 2) analysis of domestic and foreign circumstances for advanced concept fuel development and drawing-out of plans for its development, and 3) securing of basic technology for development. For analysis of nuclear fuel characteristics, expected change in design parameters at high BU has been evaluated and fuel cycle evaluation models were improved for development of fuel cycle strategy with high BU fuel. For verification and improvement of design methodology, technical feasibility of application of the existing nuclear design system to advanced fuel has been analysed and thermal-hydraulic analysis methodology is under improvement for more thermal design margin. For review of state-of-the-art and study of developmental plans, trends and circumstances of nuclear fuel development in foreign countries have been analysed and several domestic developmental plans were identified. For development of advanced nuclear fuel fabrication technology, preliminary experiments for mixing of additives with UO_2 powder were performed and state-of-the-art of new fabrication techniques which are under development in recent years were analysed.

7706 (EUROSIM–94-10) **FASMON monitoring of space dependent oscillations in a BWR.** Bergdahl, B.G.; Oguma, R. EuroSim AB, Nykoeping (Sweden). 4 Aug 1994. 21p. Order Number DE95612819. Source: OSTI; NTIS; INIS.

BWR-instabilities can occur in fundamental mode with in-phase core wide oscillations or in excited modes as out-of-phase oscillations. The fundamental mode can be successfully monitored with DR (Decay Ratio) and amplitude calculations while the out-of-phase oscillations demands phase analysis between the LPRM-signals in different parts of the core. The present report describes how the BWR-stability monitor FASMON detects such excited modes and presents the topology of the flux swing in a horizontal plane in the core. FASMON is the only available method to detect out-of-phase oscillations fast (within 20 seconds) and robust. The FASMON algorithm is based on adaptive recursive filtering technique. All investigations with FASMON presented in this report show that the software is a good monitor tool. The software makes surveillance of the phase differences and amplitudes for a number of LPRM signals. The method to calculate the phase differences is robust with the following characteristics: The response time within 20 seconds for the FASMON algorithm is very short; Robust - works even under transient conditions; Independent of the signal amplitude; A dead sensor in a LPRM-pair does not cause alarm. The report gives results from investigations using FASMON both on theoretical and measured signals. As a conclusion the investigation of the instability shows that FASMON works even under circumstances with in-phase conditions and low amplitude up to unstable conditions with out-of-phase oscillations and high amplitude. 5 refs, 12 figs.

Modern plant computers provide access to large number of plant measured/calculated data, which can be used to support the operator's work in the control room. This paper provides an overview of three support systems developed by Westinghouse: Advanced Alarm Management System (AWARE), Revolutionary Core Monitoring Program (BEACON), and Computerized Procedures Package (COMPRO). The AWARE alarm management system, originally designed to be part of the Advanced Control Room design for future nuclear plants, has been tailored for backfit to operating plants and can be installed during a single plant outage. One design goal of the system is to have no alarm in the control room following a reactor trip, as long as the systems are behaving as designed. AWARE can be installed as a full backfit or as a partial backfit using existing annunciator tiles, or provide separate alarm treatment to the plant computer. BEACON is a core monitoring, analysis, and prediction tool that provides unparalleled power for understanding and planning core operation. It calculates three-dimensional core power distributions on-line, using an advanced core model. The core model always agrees with actual operation because it is continuously updated with measurements from conventional plant instrumentation. Power distribution information is visualized through

advanced color graphics to provide users with immediate feedback and comprehensive understanding of core behaviour. COMPRO supports the operator in application of plant procedures and utilizes written procedures as basis for textual displays, prompting the operator to the actions to take and providing relevant information about the state to plant parameters. This system guides the user step by step through the plant procedures by monitoring appropriate plant data and identifying the recommended course of action. Parallel information is provided.

7711 (IAEA-TECDOC–762, pp. 19-27) **TIS process supervisory local area network (LAN).** Treflik, L. (Jaslovske Bohunice Nuclear Power Plant, Jaslovske Bohunice (Slovakia)); Sitar, Z. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

TIS - the process supervisory LAN was installed at both the NPP V-1 twin-units of WWER-440/230 type and the NPP V-2 twin-units of WWER-440/213 type at Jaslovske Bohunice, Slovak Republic, in 1992. It represents a superstructure to the existing reactor unit process computers RPP-16S and IV 500 MA at the NPP V-1 and IVS Komplex Uran 2M and KVRK at the NPP V-2. The principal goal of TIS is to supply both the main control room staff and the NPP operation personnel and operation mode engineers with process information in a larger extent and on a higher level than the existing process computers do. TIS provides following process supervision functions: Taking over Data, Data Processing, Operative and Historical Data Collection, Active Alarm Management, Mimic Diagrams, REAL-time and Historical Trending, Horizontal Bargraphs, Data Tables, Report Generation, Shift Supervisor Support in case of Failure/Accident at NPP, User Database Applications, Computerized Operating Procedures, Programmable Prompts to Operator, "Desk-top" Calculator, Communication with Professional Departments, Auto-diagnostics. TIS is a PC local area network of QNX NET type, its data transmission rate being 2.5 Mbits/second. TIS is run under QNX operating system. Application software modules are written in QNX C and C-86 languages. Some functions were completed in OnCmd v.4.2 database environment. (author). 2 figs.

7712 (IAEA-TECDOC–762, pp. 29-42) **Experience and benefits with diagnostic systems in German PWRs.** Wach, D. (Institute for Safety Technology GmbH, Garching (Germany)). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). Source: OSTI; NTIS (US Sales Only); INIS.

The detection of failures in safety relevant components at an early stage, i.e. already during power operation and in the incipient phase of the failure progress, is of valid interest for the plant operators. If there is enough time between the first indication of anomalies and the time when countermeasures have to be performed in order to avoid escalation of the defect or subsequent damages, the operator will be able to clarify the influencing parameters and to identify and diagnose the degree of the defect. Investigations and developments of early failure detection methods with emphasis on structural component integrity have been performed since many years in Germany. GRS/1ST has been deeply involved in these developments and has collected extensive operational experience from monitoring systems of reactor internals and primary circuit components in German NPPS. Computer-based systems for data analysis, feature trending and monitoring, signature display, documentation, and transmission of necessary analysis results to the central diagnosis Lab of 1ST have been established. The paper reports on the experiences with the use of such systems, and gives examples of successful failure diagnoses. The benefits of early failure detection and diagnostic systems are discussed with respect to safety and economic aspects. A proposal is made how to classify and use such systems in order to utilize the synergism of safety and availability motivations to earn their mutual benefit. (author). 14 refs, 13 figs.

7713 (IAEA-TECDOC–762, pp. 43-57) **Upgrading the VERONA core monitoring system.** Adorjan, F. (Atomic Energy Research Inst., Budapest (Hungary)); Buerger, L.; Lux, I.; Vegh, E.; Hamva, I.; Kalya, Z. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). An integrated Operator Support System (OSS) based on monitoring methodology has been built with the emphasis on monitoring carried out in real-time. The OSS is capable of identifying the abnormal functioning of the plant in terms of deviations from normality as well as sensor/signal failure as diagnostic information. For real-time monitoring, dynamic modelling of the plant plays an important role in the implementation. Each OSS component is described and its performance is illustrated by means of actual operational experience information from a nuclear power plant. (author). 12 refs, 6 figs.

7715 (IAEA-TECDOC–762, pp. 71-82) **CANDU operator decision support systems: Lessons learned and future directions.** Jones, P.E.R. (Atomic Energy of Canada Ltd., Chalk River, ON (Canada). Chalk River Nuclear Labs.); Fiset, J.Y.; Lupton, L.R. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

AECL Research is conducting applied human factors and advanced technology R and D to enhance CANDU performance and safety. The focus has been to improve human performance through interfaces, alarm and advisor systems, and procedures that better match human capabilities to plant tasks. The program is being conducted in close collaboration with operating CANDU plants and, in this way, operational experience is fed back through research to plant retrofit and new designs. One project involves the development of a prototype Critical Safety Advisor System to assist CANDU operators manage events where station safety goals are threatened. The work is based on research conducted to determine the human factors issues in decision support systems. The belief is that proper attention to human factors will help determine the conceptual and detailed design of the system, and ensure that it is accepted by intended users for the tasks they have to perform. The development of the prototype involved a strong emphasis on human factors engineering in the form of task and usability analysis coupled with a rapid prototyping development approach. This approach proved useful in obtaining cooperation from qualified operators and station staff and has led to the successful transfer of

portions of the prototype to an on line system. (author). 22 refs, 4 figs.

7716 (IAEA-TECDOC–762, pp. 99-102) **Classification of NPP operator support systems and problems with their implementation.** Alpeev, A.S. (Scientific and Engineering Centre for Nuclear and Radiation Safety of the Russian Federation, Moscow (Russian Federation)). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

Operator support systems for NPP comprise a part of the power unit process control system. A classification of operator support systems, which is based on operator's goals, is discussed in this paper. In accordance with these goals, operator support systems are subdivided into four classes. There are also considered problems for every class of operator support systems. These problems are: validation of operator support systems; safety analyses of their application; operator support system functioning and sharing of responsibilities; training of NPP operators. (author).

7717 (IAEA-TECDOC–762, pp. 103-111) **Forecast reactivity program for complex loadings.** Krasnukha, S.V. (South Ukraine Nuclear Power Plant, Juzhnoukrainsk (Ukraine)). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

The program is based on neutron-physics calculations by three dimension programs "BIPR7" and "ALBOM". Reactivity may be present as a sum of different components depending on different operation parameters. Matrix of the components is interpolated with spline for calculation of intermediate significance. Transient processes are calculated by point model depending on a thermal power and time of keeping this power. Control parameters are prepared during input stage and then reactivities are calculated for each parameter. At last, the sum of the reactivities is achieved and the critical concentration of CH3BO3 is calculated. Critical position of one of the control parameters, such as control rods, power and temperature, are to be found for each of the input conditions. The make-up can be carried our for each state and the change of concentration of CH3B03 found for three flow rates. All of the bases have graphical interface to control themselves by the neutronphysic materials. It is possible to switch the bases to each of power blocks of the station. One can output the calculated energetic fields as graphical picture for any time of the cycle. The results of this program application and the related conclusions will be present in this paper. The program is written in object-oriented language TUBO-PASCAL-6.0, and TUBO-VISION. The program requires IBM PC-AT/386 or 286 with DOS-5.0 or Windows, Mouse and 3.5 available memory on a hard disk. Time necessary to install the program is 15-10 minutes. (author). 2 refs, 6 figs.

7718 (IAEA-TECDOC–762, pp. 113-122) **NPPO - TINA: Expert system for supporting the operator's decision-making process.** Gieci, A. (Vyskumny Ustav Jadrovych Elektrarni, Trnava (Slovakia)); Mosny, J. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

Many incidents and accidents in the large technologies are beyond the automatic control. In these cases only quick operator's thinking and decision processes are able to manage the situation. In the control room instrumentation of the nuclear power plant there are no devices to aid operator's cognitive processes at present. Several attempts to fill up this gap employing the methods of artificial intelligence have been made. These systems support only a certain part of the decision process, mostly the state identification. The article gives an account of an expert system prototype NPPO-TINA developed to aid the whole operator's intellectual activity in his decision process. It is realized in the program environment TINA, intended for knowledge base systems development, using its hierarchical dynamic inference control. The system is designed for nuclear power plant operators in the Slovak and Czech Republic. (author). 5 refs, 6 figs.

The purpose of this paper is to describe the Westinghouse Safety Parameter Display System (SPDS) design and its interaction with Emergency Response Guidelines (ERGs), as a comprehensive package covering post-accident strategy. Special emphasis will also be placed on the validation and verification of SPDS with a real-time thermal hydraulic tool. Special emphasis is placed on two applications that have been proposed to the Balakovo (WWER-1000) and Leningrad (RBMK) nuclear power plants as part of an overall program to improve safety. 1 fig.

7720 (IAEA-TECDOC–762, pp. 137-145) **The concept of an information support system for operational personnel of operating nuclear power plants.** Dounaev, V.G. (Consyst Co. Ltd, Moscow (Russian Federation)); Golovanov, V.V. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

The concept, which is discussed in the paper, specifies the purpose, status, tasks and functions of an information support system, requirements to the information and software provisions, as well as the scope and forms of displays. Quality assurance measures during the implementation phase on operating NPPs are also discussed. The concept was designed by the working group composed by the specialists of VNIIAES, Atomenergoproject, Gidropress, NIKIET and Consyst on the request of Concern Rosenergoatom. The primary objective of an information support system is to help an operator in the main control room to evaluate a safety status of a power unit and to take appropriate measures during normal operation, transients or, what is of utmost importance, in abnormal situations, design-basis and beyond-design-bases accidents. The first priority functions of operator aids, intended for the implementation at the operating NPPs, are a critical safety functions display, intellectual annunciation system, early fault detection and diagnosis. The system of information support can be implemented as a separate computer module, integrated in operating process control system of a power unit. The work on the implementation of an information support system is being carried out in the framework of modernization of operation process control system. (author). 4 refs.

7721 (IAEA-TECDOC–762, pp. 147-155) **Functional design bases for a safety parameter display system for WWER-type reactors.** Anikanov, S.S. (Consyst Co. Ltd, Moscow (Russian Federation)); Smirnov, S.P. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes the basic features of the safety parameter display system (SPDS) for WWER-type reactor. During the realization of the system the major attention has been paid to the utilization of the existing computer facilities of the power unit instrumentation and control system. The notable feature of the proposed SPDS version for NPPs in Russia lies in the fact that while designing one should take into account beforehand the requirements of local and national Crisis Centers being a part of the general system for controlling NPP safe operation ("Garant"). Such an approach lead to the fact that on different levels of the SPDS implementation different numbers of critical safety functions (CSF) are used. Besides, in the system is widely used a set of formats representing functional relations among the safety parameters that allows to make easier the process of occurrence identification. (author). 8 figs.

7722 (IAEA-TECDOC–762, pp. 157-163) **The design concept of an on-line diagnosis system of a sophisticated technological object: The shell of expert diagnosis system "Dasha".** Adamov, E.O. (Research and Development Inst. of Power Engineering, Moscow (Russian Federation)); Glazov, O.N.; Eperin, A.P.; Strepetov, N.V. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents a design concept of the on-line diagnosis system of any sophisticated technological object with an arbitrary nature of physical features. The software shell "DASHA" is developed based on the proposed concept with the use of the the "Table of failures" analysis method. It permits to design an expert diagnosis system of any sophisticated technological object. At present the expert on-line diagnosis system of main process equipment based on the "DASHA" shell is put into trial operation at Leningrad NPP-I. (author). 1 fig.

7723 (IAEA-TECDOC–762, pp. 165-176) **Generic information display system for the control centre of the nuclear power station power unit.** Tiapchenko, Y.A. (Institute of Aircraft Equipment, Zhukovsky (Russian Federation)). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

Over the last years much attention was given to the problem of man-machine interface management for the control systems of high risk object. Modular control panels with computerized display systems are proposed in a number of projects. Rejection of expanded mnemonics and transition to integrated mnemonics and automated workstations feature these projects. The implementation of such systems is related to the need to overcome a number of difficulties. The specialists is automated control systems (ACS) encountered the similar situation in astronautics and then in aviation. Therefore it is reasonable to take into consideration their experience while designing ACS or modifying operational ACS for the power units of atomic stations. In addition, the experience of soviet specialists in the field of astronautics is the most useful from our point of view. Information display systems of manned spacecrafts, starting with the "Vostok", substantially differed from those of aircraft and American spacecrafts. Compact consoles using command compression and multifunctional electronic displays and controls were proposed in place of expanded consoles. Based on the experience in astronautics the paper considers the problems of designing a console panel for the integrated IDS and consoles for the ACS of complex objects, including a power unit of the atomic power station. The power unit IDS is presented as an integrated shared system and the operators' workstations. The shared system consists of four levels to display a general status of the power unit; accidents related to the power unit safety; the main parameters and arrangements of the power unit; instruction of goal designations. The workstations have the four similar levels related to the reactor plant or turbine and additional levels to display particular parameters and limitations, routine control and critical situation isolation of a space station and the console of the operator's workstation. (author). 10 refs, 8 figs.

7724 (IAEA-TECDOC–762, pp. 177-184) **A double-channelled safety critical process visualization.** Schildt, G.H. (Technical Univ., Vienna (Austria). Inst. for Automation). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

This contribution presents a safety critical process visualization based on a double-channeled data processing system. Data processing for a safety critical process visualization is done by a double channeled microprocessor system applying the safe microprocessor system. Results from both microprocessor channels are monitored by a fail-safe comparator based on an antivalent function module. Additionally, process visualization is dynamized by a periodically operating switch connecting each display generation system to the screen. In case of any failures, corresponding process element symbols will be displayed blinking at a rate that corresponds to the switching rate. For colored displays ail additional color bar is installed to demonstrate that all used colors can be displayed. The fundamental idea for such a safety critical process visualization is to have a complete closed safety chain throughout the whole system, conceptually. Therefore, an operator is only allowed to perform safety critical operations in case of no-process-element-blinking. Commands given by an operator are protocolled on a control and failure printer, additionally, without any chance for data manipulation. (author). 5 refs, 8 figs.

7725 (IAEA-TECDOC–762, pp. 185-189) **Intelligence operator support system.** Anosov, A.I. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii); Ahmadeev, R.G.; Dubkov, S.L.; Sivakov, A.A.; Khazanovich, I.M. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes a system which is capable of discerning an onset of abnormal situations arising in the course of the NPP operation and providing recommendations to the operator in his control actions. The system represents a set of interrelated algorithm with two models. One is intended for automatic diagnostics of the functioning of the on-board "Topaz-2" type SNPP. The other can be used as a part of the automatic control system of the technological processes in the NPP. The software is intended for the implementation in the IBM-PC/AT compatible computers. (author). 3 figs.

7726 (IAEA-TECDOC–762, pp. 193-198) **Operation support systems in nuclear power plants. Diagnostic aids: Alarm logic systems.** Jimenez, A. (TECNATOM SA, Madrid (Spain)); Gilabert, J.E. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

Potential demand for the improvement of conventional annunciator systems has long been one of the major technical issues in the nuclear power plant control room design. The microprocessor-based systems can provide capabilities such as alarm logic, programmable assignment of alarms inputs to annunciators windows and communications with other systems that can significantly

improve the processing and display of alarm information to the operator. The main emphasis for the implementation of computerized monitoring systems has been the support of operators by showing just the necessary information. This paper describes the results of project, called Alarm Logic System, and which is an attempt to deal with a problem of information display and interpretation by the operator, using the existing software capabilities in the control room process computer. (author). 1 fig.

7727 (IAEA-TECDOC–762, pp. 199-205) **SPDS development for an RBMK unit.** Gorelov, A.I. (Research and Development Inst. of Power Engineering, Moscow (Russian Federation)); Mikhailov, M.N.; Proshin, V.A.; Sazonov, N.P. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

Serious upgrades and improvements are made and planned in Russia to enhance safety of the nuclear power plants with the RBMK-reactor types. An important part of these measures is improvement in the area of safety parameters' presentation. Safety Parameters Display System is developed for implementation on the plants and on the special services for nuclear safety surveillance and management, on the operation support centers. The SPDS development and implementation are made within and with the large scale actions (which include I and C systems upgrades) towards enhance safety and reliability of RBMK nuclear plants in Russia. This fact influence upon work schedule and requires special efforts to co-ordinate various types of activities. There are many features on this type of reactor that determine detailed set of the safety parameters and functions. Main of these features and existent I and C and MCR are described. Safety parameters are grouped into three levels; besides that number of channels' parameters is decreased by means of calculations. SPDS functional and technical requirements are developed on the basis of deep knowledge of the plant features, safety parameters' list, operational experience, instructions and task analysis. Special group of specialists is involved to solve "human factor" problems. We believe that Westinghouse new computer technology and SPDS design and implementation experience would used. (author).

7728 (IAEA-TECDOC–762, pp. 207-216) **A model based diagnostic system for the identification of malfunctioning components using a constraint propagation paradigm.** Ha Jaejoo (Korea Atomic Energy Research Inst., Taejon (Korea, Republic of)); Hajek, B.K.; Miller, D.W. International Atomic Energy Agency, Vienna (Austria). Sep 1994. Contract DE-FG07-88ER12819. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

A commonly recognized failing of traditional rule-based diagnostic expert systems is the inability to recognize problems outside the range of expertise. In turn, the capability of such expert systems is limited to well-known problems. Contrary to the traditional approach, a model-based system has a potential to diagnose unexpected malfunctions. In this paper, a model-based diagnostic system for the isolation of malfunctioning components using constraint propagation paradigm - the CBDS, the Constraint Based Diagnostic System - is presented. The CBDS consists of (1) symbolic representation of plant model as a knowledge base, and (2) constraint propagation paradigm as a diagnostic inference engine. In the CBDS, a plant model contains information about intended behaviour of components that are organized in a component model library, as well as information about how the components are interconnected. As a diagnostic inference engine, the CBDS uses the general idea of model-based diagnosis to identify malfunctioning components. (author). 15 refs, 8 figs.

7729 (IAEA-TECDOC–762, pp. 217-221) **Creation of a computerized operator support system at Unit 5 of the Novovoronezh Nuclear Power Plant.** Scorodumov, V.A. (Novovoronezh Nuclear Power Plant, Novovoronezh (Russian Federation)). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

The issues discussed are: the condition for interaction of the subject and object of management, ensuring safe and reliable plant operation, and a need for operator support system (OSS) installation to satisfy this condition; the objective prerequisites existing at the Novovoronezh NPP for OSS development and installation at the Novovoronezh Unit 5; the adopted approaches to a step-by-step implementation, basing on "from-simple-to complex" concept, using a unified software with the most user-friendly interface, which allows to solve the task of gradual user training, as well as OSS set-up and debugging without any interference with the plant performance; prospects for OSS configuration development in the course of increasing complication of the tasks being solved by the OSS. (author). 2 figs.

7730 (IAEA-TECDOC–762, pp. 223-225) **The development of WWER monitoring and diagnostic concept.** Kuzil, A.S. (Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Moscow (Russian Federation). Inst. Atomnoj Ehnergii). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

Safety and efficiency of NPP operation is ensured to a great extent by the quality of implementation of a reactor monitoring and diagnostics. A complex of monitoring and diagnostic system (MDS) is planned to be implemented in operating WWER and those which are in the design phase. MDS is designed as a complex of weakly interconnected subsystems capable of further improvements and performing the assigned functions on a full scale (therefore, a subsystem incorporates detectors, communication lines, instruments, computer facilities and software). MDS design makes provisions for step-by-step development of basic subsystems. MDS being developed is proposed to be installed gradually in all operating NPPs with WWERs. (author). 1 fig., 1 tab.

7731 (IAEA-TECDOC–762, pp. 227-232) **Basic principles of providing operator information support for power plant control of the VPBER-600 reactor plant.** Novikov, V.V. (OKBM, Nizhny Novgorod (Russian Federation)); Pobedonostsev, A.B.; Shashkin, S.L. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents basic principles of providing favorable information medium for personnel, including organization of operator support system. Basic decisions on organization of information presentation in main control room and technical means which are supposed to be used are considered. The report shows that operator support system is integrated in process control system, defines its place in a general scheme of information presentation. Taks of operators support system in various power plant operating modes are indicated. So, in power plant start-up mode operator support system given an operator an information on the mode and necessary procedures of control activities in accordance with operating schedule. During the plant power operation in the basic mode operator support system sends and operator messages about failures at the initial stage of their beginning on the basis of logical processing of operative and diagnostic information. On the basis of the information obtained an operator may undertake corresponding correction actions. In emergencies accompanied by additional number

of failures relative to the designed ones operators support systems gives an operator recommendations on beyond design accident control. The report also presents description of operator interacting with the support system. Basic principles of information presentation concerning operator support system are described. (author).

7732 (IAEA-TECDOC–762, pp. 235-243) **Development of an advanced man-machine system for Japanese PWR plants.** Satoh, T. (Mitsubishi Heavy Industries Ltd., Kobe (Japan). Kobe Shipbuilding and Engine Works); Kobashi, S.; Saito, M. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

Advanced Man Machine System for Japanese PWR plants (MMS - PWR) is a prototype system of the operator supporting system that has been developed by Mitsubishi Heavy Industries, Ltd., Mitsubishi Electric Co. and Mitsubishi Atomic Power Industries, Inc. for five years from 1987 to 1991, under the financial support of MITI (the Ministry of International Trade and Industry of Japanese government). The aim of this system development is to further increase operation reliability and operability of PWR plants. For this purpose the knowledge engineering and the up-to-date computer technologies have been introduced into the design of a prototype system that can offer the information, infer and judge according to operator's thinking process in grasping the plant status and the operations. Also the system has been verified. A prototype system has the following supporting functions: (1) Operator Supporting Function for Normal Operation: Flexible operator supporting function for re-start-up and load following operation that will be needed for Japanese PWR plants in the future. (2) Operator Supporting Function for Abnormalities and Accidents: Early detection and identification of abnormality or accident of the plant, and guidance to appropriate countermeasures. (3) Operator Supporting Function for Maintenance: Supporting function for evaluation of the influence of maintenance on plant components, as well as for the isolation and restoration procedures during plant operation. (4) Optimum Operation Surveillance Function: Intelligence man machine interface that enables operators to understand various plant data precisely and offers the proper answers of what they need to know. (author). 6 figs, 2 refs.

7733 (IAEA-TECDOC–762, pp. 245-249) **Use of interview and inquiry procedures in design process for NPP control room upgrade.** Golovanev, V.E. (Research and Development Inst. of Power Engineering, Moscow (Russian Federation)); Gorelov, A.I.; Proshin, V.A. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Major part of design activities for upgrade of NPP control rooms is using NPP personnel operating experience and participation of NPP personnel in detecting and solving the human factor problems. The ways of such participation include application of various human factors engineering and psychological techniques, for example interviews, inquiries (filling in questionnaire), operator activity observations. The present paper deals with activation of NPP personnel role in the design of control room upgrade, in particular, in creation of operator support systems. NPP personnel selection for incorporation in NPP upgrade group and initial training design skills are considered. NPP personnel responsibilities during particular stages of control room designing are specified. (author). 1 ref.

7734 (IAEA-TECDOC–762, pp. 251-260) **A severe accident simulator for the Paks Nuclear Power Plant.** Gyenes, G. (Atomic Energy Research Inst., Budapest (Hungary)); Maroti, L.; Vegh, E.; Vertes, P. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). Source: OSTI; NTIS (US Sales Only); INIS.

The model is discussed of a Nuclear Power Unit management by the "managing community", where any operator is on the one hand a subject of management in relation to the machine as an object of management, and on the other hand - an object of management by the hierarchic structure of the managing community. Contradictions are analyzed arising on the basis of the ambivalent operator position as well as possible ways to resolve them. Attempts are made of mathematical formalization of conditions for non-contradictory "managing community-machine" interaction. Theorems of Plant operations safety culture are proposed, based on the results obtained. (author). 3 refs, 2 figs.

7736 (IAEA-TECDOC–762, pp. 271-279) **Enhancement of verification and validation for nuclear reactors through artificial intelligence.** Turkcan, E. (Netherlands Energy Research Foundation (ECN), Petten (Netherlands)); Ciftcioglu, O. International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

In parallel with the rapid advancements in computer technology, there is growing concern in application of computer-enhanced methodologies in human-machine integrated complex systems virtually for the same essential goals, namely: safe, reliable and cost effective operation. In this context, the relevant studies may have various focal points such as plant wide monitoring, verification and validation, fault diagnosis and so on. This work highlights the eminent role which artificial intelligence (AI) and AI-based methodologies can play in designing operational enhancement of nuclear power reactors with particular reference to verification and validation. (author). 11 refs, 3 figs.

7737 (IAEA-TECDOC–762, pp. 281-287) **Critical methodological issues in evaluation of operator support systems.** Tanabe, F. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan)). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

In evaluating new operator support system for NPP from the view point of assuring public safety, followings are key points to be taken account of: (a) Situation should include unfamiliar and unanticipated events. (b) Function should include unintended one. (c) Concerned human operator is expert to have been fully adapted to the new system. Those points make thorough evaluation difficult only with empirical methods and call for an integrated methodology of analytical and empirical methods. Critical issues are reviewed and a framework of an integrated methodology is discussed. (author). 15 refs, 4 figs.

7738 (IAEA-TECDOC–762, pp. 289-295) **Computer software review procedures.** Mauck, J.L. (Nuclear Regulatory Commission, Washington, DC (United States)). International Atomic Energy Agency, Vienna (Austria). Sep 1994. (CONF-9305401–: Specialists meeting on operator support systems in nuclear power plants, Moscow (Russian Federation), 17-21 May 1993). In *Operator support systems in nuclear power plants. Proceedings of a specialists meeting held in Moscow, Russian Federation, 17-21 May 1993.* 305p. Order Number DE95615882. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents a summary of the NRC criteria and review approach used for digital retrofit reviews. This description is not all inclusive of the questions asked and material reviewed and referenced, but does cover the major areas. The Nuclear Regulatory Commission (NRC) review performed on the hardware portion of the computer is consistent with that which has been performed for past analog systems. That is, our review of the computer hardware should lead to the conclusion that the appropriate 10 Code of Federal Regulation (CFR) 50 General Design Criteria (GDC) are met, including applicable Institute of Electronic and Electrical Engineers (IEEE) standards and the appropriate regulatory guides. In particular, IEEE-279-1971 requirements have to be met including manual initiation capabilities, control/protection system interactions, physical separation and independence and testability. The one area that is not sufficiently covered by the regulatory criteria used in past staff reviews was the validity, qualification level, and reliability of resident software. Standards and regulations have emerged which impose new guidance for independent V and V on software intended to be used to perform safety related functions. Acceptable system V and V has been recognized as a means to bridge the gap between known hardware safety requirements and the software qualification requirements needed for safety systems. These records will provide a mechanism for regulatory review and approval. (author).

7739 (IAEA-TECDOC–769) **Current practices and future trends in expert system developments for use in the nuclear industry. Report of a specialists meeting held in Tel Aviv, Israel, 11-15 October 1993.** International Atomic Energy Agency, Vienna (Austria). Oct 1994. 147p. (CONF-9310404–: Specialists meeting on current practices and future trends in expert system developments for use in the nuclear industry, Tel Aviv (Israel), 11-15 Oct 1993). Order Number DE95615814. Source: OSTI; NTIS (US Sales Only); INIS.

There are three major objectives of this report. Each relates to the development of expert systems which improve the safety and efficiency of nuclear facility operations. The first objective is to identify the major distinct applications of expert systems as they relate to nuclear safety. The second objective is to identify future expert system development trends in order to help anticipate emerging tools which may spark rapid development or identify trends which may hinder its growth. The third objective is to identify development challenges. Refs, figs and tabs.

7740 (IAEA-TECDOC–769, pp. 23-32) **Using knowledge based systems for rams analysis and on-line operator support of nuclear power plants.** Scheer, S. (Commission of the European Communities, Ispra (Italy). Joint Research Centre); Wilikens, M. International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310404–: Specialists meeting on current practices and future trends in expert system developments for use in the nuclear industry, Tel Aviv (Israel), 11-15 Oct 1993). In *Current practices and future trends in expert system developments for use in the nuclear industry. Report of a specialists meeting held in Tel Aviv, Israel, 11-15 October 1993.* 147p. Order Number DE95615814. Source: OSTI; NTIS (US Sales Only); INIS.

With the growing complexity of safety-critical industrial systems there is a need for computer-based tools which integrate different activities related to the layout of such systems and focussing on risk assessment in general. These activities should not only be applicable for early decision taking during the design phase but also allow an advanced maintenance over the whole life of an industrial system and even support on-line operator decision making. Thus such intended activities are embedded in an overall domain description flexible to adapt itself to different situations and extendible for any kind of additional information to attach to. On the other side, however, special applications running in the given domain should react to very specific contexts given by the user and keep their knowledge for themselves. Current research resulted in the development of a methodology (STARS) and an off-line tool (Plant Editor) with which advanced layout techniques, domain administration and extension, and an evaluation of a layout topology are combined. In particular, when using this tool one has a powerful expert system for the design and maintenance of nuclear power plants. In the second part of this paper a tool and methodology (FORMENTOR) for providing on-line decision support to operators is described. (author). 13 refs, 6 figs.

7741 (IAEA-TECDOC–769, pp. 33-45) **The status of application of neural networks in the nuclear industry.** Boger, Z. (Israel Atomic Energy Commission, Beersheba (Israel)). International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310404–: Specialists meeting on current practices and future trends in expert system developments for use in the nuclear industry, Tel Aviv (Israel), 11-15 Oct 1993). In *Current practices and future trends in expert system developments for use in the nuclear industry. Report of a specialists meeting held in Tel Aviv, Israel, 11-15 October 1993.* 147p. Order Number DE95615814. Source: OSTI; NTIS (US Sales Only); INIS.

Artificial neural networks (ANN) are now accepted as a very practical AI technique, used for many applications in various fields. The nuclear industry, although aware of the potential benefits of the application of ANN, is slow in accepting this technique in nuclear power plants (NPP) control rooms, even for operator advisory roles. However, the technique is now being considered for predictive maintenance systems of NPP components, and for support roles in non-safety related systems, such as load forecasting, water chemistry, fuel management and safeguards systems. Active research on the properties and possible applications of ANN in NPP's is carried out in universities and national laboratories in several countries. Training data is supplied by the nuclear industry, either as real NPP operating data or from full scale simulators. The ability to train large scale ANN is crucial to their successful implementation in real-life situations, enabling also the development of auto-associative ANN for real-time fault diagnostics. In a demonstration example of a simulated material transfer system with 50 components, an auto-associative ANN was able to sense immediately the presence of a fault during an operation, and diagnose correctly the faulty component. (author). 101 refs.

7742 (IAEA-TECDOC–769, pp. 55-68) **Qualitative processing of uncertainty, conflicts and redundancy in knowledge bases.** Zbytovsky, V. (Ustav Jaderneho Vyzkumu CSKAE, Rez (Czech Republic)). International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310404–: Specialists meeting on current practices and future trends in expert system developments for use in the nuclear industry, Tel Aviv (Israel), 11-15 Oct 1993). In *Current practices and future trends in expert system developments for use in the nuclear industry. Report of a specialists meeting held in Tel Aviv, Israel, 11-15 October 1993.* 147p. Order Number DE95615814. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes two techniques, created and implemented in the course of development of the real-time on-line expert system Recon at the Nuclear Research Institute at Rez, Czech Republic. The first of them is the qualitative processing of uncertainty, which is based on the introduction of the third logic value to logic data objects, and the credibility flag to arithmetic data objects. The treatment of the third value and credibility flags during the inference, the explanation method based on the graphic representation and the uncertainty processing during the explanation are also mentioned. The second technique, is a semantic checking of knowledge bases, which enables us to recover parts of the bases, that are meaningless, either because of an error during their implementation into a base, or because they are redundant. The paper includes the explanation of basic terms of this method, such as so called conflicts, K-group and K-situation. The two types of the conflict (dead-end and bubble) are also discussed. The paper also offers the complete mathematical apparatus, which the checking method is based on. (author). 4 refs, tabs.

7743 (IAEA-TECDOC–769, pp. 81-85) **SAMSON: Severe accident management system on-line network.** Silverman, E.B.

(ARD Corp., Columbia, MD (United States)). International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310404--: Specialists meeting on current practices and future trends in expert system developments for use in the nuclear industry, Tel Aviv (Israel), 11-15 Oct 1993). In *Current practices and future trends in expert system developments for use in the nuclear industry. Report of a specialists meeting held in Tel Aviv, Israel, 11-15 October 1993.* 147p. Order Number DE95615814. Source: OSTI; NTIS (US Sales Only); INIS.

SAMSON is a computational tool used by accident managers in the Technical Support Centers (TSC) and Emergency Operations Facilities (EOF) in the event of a nuclear power plant accident. SAMSON examines over 150 status points monitored by nuclear power plant process computers during a severe accident and makes predictions about when core damage, support plate failure, and reactor vessel failure will occur. These predictions are based on the current state of the plant assuming that all safety equipment not already operating will fail. SAMSON uses expert systems, as well as neural networks trained with the back propagation learning algorithms to make predictions. Training on data from an accident analysis code (MAAP - Modular Accident Analysis Program) allows SAMSON to associated different states in the plant with different times to critical failures. The accidents currently recognized by SAMSON include steam generator tube ruptures (SGTRs), with breaks ranging from one tube to eight tubes, and loss of coolant accidents (LOCAs), with breaks ranging from 0.0014 square feet (1.30 cm^2) in size to breaks 3.0 square feet in size (2800 cm^2). (author). 1 fig.

7744 (IAEA-TECDOC--769, pp. 93-101) **An expert system for diagnosing failures in the condensate system of the Laguna Verde Nuclear Power Plant.** Arellano, J. (Instituto de Investigaciones Electricas, Cuernavaca (Mexico)); Ramirez, E.; Galicia, Y. International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310404--: Specialists meeting on current practices and future trends in expert system developments for use in the nuclear industry, Tel Aviv (Israel), 11-15 Oct 1993). In *Current practices and future trends in expert system developments for use in the nuclear industry. Report of a specialists meeting held in Tel Aviv, Israel, 11-15 October 1993.* 147p. Order Number DE95615814. Source: OSTI; NTIS (US Sales Only); INIS.

An expert system for diagnosing faults and processing alarms during operation of the Condensate System of a boiling water reactor nuclear power plant is presented here. The main features of this system are its systematic knowledge acquisition methodology, based on Probabilistic Risk Analysis techniques, and an intelligent alarm prioritizing mechanism for generating optimal, very fast inference strategies. The main developing tool for was the GENESIS shell, a specific use tool developed by the authors of this paper. (author). 4 refs, 5 figs.

7745 (IAEA-TECDOC--769, pp. 103-112) **Application of artificial neural networks in estimation of probable accident causes in nuclear power plants.** Keter, A. (Israel Atomic Energy Commission, Beersheba (Israel)); Boger, Z. International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310404--: Specialists meeting on current practices and future trends in expert system developments for use in the nuclear industry, Tel Aviv (Israel), 11-15 Oct 1993). In *Current practices and future trends in expert system developments for use in the nuclear industry. Report of a specialists meeting held in Tel Aviv, Israel, 11-15 October 1993.* 147p. Order Number DE95615814. Source: OSTI; NTIS (US Sales Only); INIS.

An exploratory study was made to train an ANN to predict the probabilities of four causes of accidents (loss of coolant accident types), based on the time behaviour of three selected parameters (pressurizer pressure and level and containment humidity). 316 time scenarios have been generated, with the cause probabilities calculated by Bayesian procedures. Four ANN models were trained by the TURBO-NEURON 1.1 software package on a basis of 251 cases to predict the cause probabilities of a particular accident scenario. The generalization capacity of the models was tested by comparing the results of the remaining 65 cases. It was found that the ANN models were able to classify correctly the original cause in 88% of the test cases, while the probability of correct prediction by random guess is 25%. This result is considered quite encouraging for further work, in view of the possibility to increase easily the number of training cases, with a consequent increase in the generalization capability. 19 refs, 1 fig.

7746 (IAEA-TECDOC--769, pp. 113-121) **Rex: A methodology used for the structured processing of nuclear power plant operation experience feedback, principles and extension to case based reasoning.** Malvache, P. (CEA Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France)). International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310404--: Specialists meeting on current practices and future trends in expert system developments for use in the nuclear industry, Tel Aviv (Israel), 11-15 Oct 1993). In *Current practices and future trends in expert system developments for use in the nuclear industry. Report of a specialists meeting held in Tel Aviv, Israel, 11-15 October 1993.* 147p. Order Number DE95615814. Source: OSTI; NTIS (US Sales Only); INIS.

Rex project involves: A method for analyzing needs and identifying sources of experience; Procedures for constructing elementary pieces of experience from documents, data bases, or interviews; Procedures for building up a computer representation of the knowledge domain at stake; A software package which includes a multimedia interface, and a retrieval engine that produces information files on the basis of questions in natural language. An extension to a Case Based Reasoning system oriented toward operation diagnostic is presented. Rex is an experience management method that was initiated and developed by the CEA in order to preserve and make use of the experience gathered during nuclear reactors design and start-up phases. The objective of the initial application was to preserve the knowledge feedback on the start-up of the European fast reactor Super-Phenix. Recent studies point out that an increasing number of companies consider the management of their experience as a strategic concern. Capitalizing experience concerning NPP's operation becomes a key-factor in companies' competitiveness and in NPP's safety. After raising the problem of experience management, we describe the principle of an Experience Feed-back Cycle. Then the Rex approach is introduced as an organic answer to the functional requirements of the cycle. Finally, an extension to a Case Based Reasoning system oriented toward operation diagnostic is presented. 6 refs, 9 figs.

7747 (IAEA-TECDOC--769, pp. 137-144) **Nuclear power plant diagnostics using artificial neural networks.** Elias, E. (Israel Inst. of Technology, Haifa (Israel)); Wacholder, E.; Tramer, M. International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310404--: Specialists meeting on current practices and future trends in expert system developments for use in the nuclear industry, Tel Aviv (Israel), 11-15 Oct 1993). In *Current practices and future trends in expert system developments for use in the nuclear industry. Report of a specialists meeting held in Tel Aviv, Israel, 11-15 October 1993.* 147p. Order Number DE95615814. Source: OSTI; NTIS (US Sales Only); INIS.

Enhanced safety, reliability and operability of nuclear power plants may be achieved by the application of neural networks as a diagnostic tool to define the state of the plant at any given time. The paper presents a new neural network methodology, based on the backpropagation learning algorithm, for malfunctions management in nuclear power plants. It is shown that neural networks can be used for identifying the nonlinear dynamic behaviour of nuclear power plant components, and for isolating the origin and extent of a failure, when occurring, using consecutive samplings of sensors readings. (author). 21 refs, 5 figs.

7748 (KAERI/RR--1192/92) **Intelligent control and automation technology for nuclear applications.** Kim, Jae Hui (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Huh, Young Hwan; Lee, Jang Soo; Kim, Ko Ryeo; Cha, Kyoung Ho; Lee, Jae Cheol; Dong, In Sook. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jan 1993. 182p. (In Korean). Order Number DE95612820. Source: OSTI; NTIS; INIS.

This project intends to establish the basic technology of intelligent control and automation to be applied to the next generation nuclear plant. For that, the research status of those technologies is surveyed for various application areas at first. The characteristics and availability of those techniques such as neural network, fuzzy

rule based control and reasoning, multimedia, real-time software and qualitative modelling are studied through a series of simulations and experiments. By integrating each technologies studied above, we developed a hierarchical, intelligent control system for an autonomous mobile robot as a test bed. The system is composed of several modules of software and hardware subsystems, which are implemented by use of the intelligent techniques. Through the analysis of the results and experiences, we investigated the feasibility of application of the basic technology to the next generation plant. (Author).

7749 (KAERI/RR–1263/93) **A study on the application of the fuzzy logic controllers (II).** Moon, Byung Soo (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Lee, Byung Sun; Han, Kwang Soo; Moon, Jae Sun; Hong, Suk Boong; Choi, Yong Kil; Yoon, Ki Byung. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 94p. (In Korean). Order Number DE95612852. Source: OSTI; NTIS; INIS.

We have studied how to generate a fuzzy logic controller whose output is identical to that of a given PI controller. Based on this study, we have analyzed what makes the fuzzy logic controller perform better than the PI controller. We have also designed and manufactured a laboratory equipment for the swell and shrink effects to the water level by opening and closing the steam dump valve. An analysis was performed on how the time delay effects are linked to the physical states of the steam. (Author).

7750 (KAERI/RR–1338/93) **The development of human factors experimental evaluation techniques -The development of human factors technologies-.** Sim, Bong Shick (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Oh, In Seok; Cha, Kyeong Ho; Lee, Hyun Chul. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Apr 1994. 157p. (In Korean). Order Number DE95612821. Source: OSTI; NTIS; INIS.

In the 2nd year of the research project for the development of human factors evaluation techniques, we first defined the experimental target systems by the comparison study of the advanced control rooms proposed by foreign countries in order to make the experiment feasible and realistic for the 10 experimental items selected in the first year of the project. Then we have decided to confine our research on the big board overview panel and operator workstations. Following the development of selection criteria for our research interest, we have identified the design variables which may influence the performance of the operator by the functional analysis. The experimental variables which will be used for the evaluation of the proposed items are then defined by the relational analysis between evaluation items and design variables and they are classified by the characteristics of the measurement data. The functional requirements of ITF are developed to accommodate the necessary functions for carrying out the 10 evaluation items. The functional requirements for each sub-system of ITF have been developed with the experimental paradigm of APTEA. Finally we have reviewed the compact nuclear simulator (CNS) at KAERI from the point of view of jyman factors guidelines/principles and proposed the two possible layouts for the experimental apparatus for the evaluation of display alternative and operational procedure. (Author).

7751 (PINSTECH–130) **Development of a new control software package for Pakistan Research Reactor-2.** Qazi, M.K. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div.). Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div. May 1993. 44p. Order Number DE95615883. Source: OSTI; NTIS (US Sales Only); INIS.

12 fig.

The development of a new control software package for Pakistan Research Reactor-2 is presented. The software operates in different modes which comprises of surveillance, pre-operational self tests, operator, supervisor and robotic control. The control logic critically damp the system minimizing power overshoots. The software, handles multiple abnormal conditions, provides an elaborate access control and maintains startup/shutdown record. The report describes the functional details and covers the operational aspects of the new control software. (author). 12 fig.

7752 (PNL-SA–19604) **Team interaction skills evaluation criteria for nuclear power plant control room operators.** Montgomery, J.C. (Pacific Northwest Lab., Richland, WA (United States)); Toquam, J.; Gaddy, C. Pacific Northwest Lab., Richland, WA (United States). Sep 1991. 9p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9109160–6: 35. Human Factors Society (HFS) annual meeting, San Francisco, CA (United States), 2-6 Sep 1991). Order Number DE95004569. Source: OSTI; NTIS; INIS; GPO Dep.

Previous research has shown the value of good team interaction skills to group performance, yet little progress has been made on in terms of how such skills can be measured. In this study rating scales developed previously (Montgomery, et al., 1990) were extensively revised and cast into a Behaviorally Anchored Rating Scale (BARS) and a Behavioral Frequency format. Rating data were collected using 13 training instructors at the Diablo Canyon Nuclear Plant, who rated three videotapes of simulator scenario performance during a day-long training session and later evaluated control room crews during requalification training. High levels of interrater agreement on both rating scales were found. However, the factor structure of the ratings was generally inconsistent with that hypothesized. Analysis of training ratings using Cronbach's components of accuracy (Cronbach, 1955) indicated that BARS ratings generally exhibited less error than did the Behavioral Frequency ratings. The results are discussed in terms of both field and research implications.

2205 Environmental Aspects

7753 (Juel–2889) **Radiation exposure due to gamma-ray submersion.** Rohloff, F. Forschungszentrum Juelich GmbH (Germany). Abt. Sicherheit und Strahlenschutz; Technische Hochschule Aachen (Germany). Mar 1994. 115p. (In German). Order Number DE95738787. Source: OSTI; NTIS (US Sales Only); INIS.

The report explains the development of the mathematical foundations for calculation of the dispersion factors of gamma-ray submersion, and the calculations. The Gaussian model describing the dispersion quasi like a molecular diffusion is one of the starting points, the other is the point-kernel model for the transport of gamma rays, with radiation transport being treated as quasi optical, and build-up factors being used for describing the impact of interaction between gamma radiation and matter. The time-space continuum integration was to be done for calculation of the dispersion factor. The time integration was done first, and for the remaining space integration, the convergence problems were solved. (orig./HP)

7754 (KAERI/RR–1253/93) **Site selection of meteorological tower and environmental impact assessment of the cooling tower.** Lee, Young Bok (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Kim, Byeong Uh; Han, Moon Hee; Kim, Eun Han; Soe, Kyeong Seok; Hwang, Won Tae. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Oct 1993. 101p. (In Korean). Order Number DE95612549. Source: OSTI; NTIS; INIS.

Meteorological characteristics related to the site complexity should be considered to assess the impact on the surrounding environment due to the operation of cooling towers of the KMRR. Meteorological towers should be installed in positions representing the site complexity well. The purpose of this project is to assess the environmental impact due to vapor and drift released from cooling towers as well as to select optimal locations of meteorological towers.

7755 (KAERI/RR–1310/94) **Analysis of chemical factors affecting marine ecosystem around nuclear power plant.** Chun, Kwan Sik (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Choi, Yoon Dong; Chun, Ki Jeong; Kim, Jin Kyu; Jung, Kyeong Chai; Lee, Yeong Keun; Park, Hyo Kook. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jun 1994. 120p. (In Korean). Order Number DE95612553. Source: OSTI; NTIS; INIS.

The ecological data of the coastal area of Youngkwang nuclear power plant from 1987 to 1993 were comprehensively analyzed,

and various physical and chemical properties of sea water and sediments were measured. Major factors affecting phytoplankton standing crops were suspended substances, nitrate, and silicate. The contents of iron, chromium, copper, and sulfur in sediments sampled from the discharge channel were slightly higher than those in the other areas. In order to qantify the chemical impacts on marine ecosystem, it is desirable that a systematic survey be made through the whole year cycle to assure the consistency and confidence of the related data. (Author).

7756 (KAERI/RR–1331/93) **Development of computing code system for level 3 PSA -A study for nuclear safety improvement-.** Kim, Dong Ha (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Kim, Kil Yoo; Jeong, Jong Tae; Hwang, Mi Jeong. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 159p. (In Korean). Order Number DE95613327. Source: OSTI; NTIS; INIS.

Among the various atmospheric dispersion models, a Gaussian plume model was chosen for Level 3 PSA. The merits of this model are: cost-effectiveness in computing time, unnecessity of complicated atmospheric data, and the comparable output to the detailed computing codes for a flat terrain. In order to complement the simple nature of the Gaussian mode, corrections on the plume rise, the mixing height, the wet and dry deposition, and the radionuclide decay were documented. A stand-alone computer code was developed to simulate the atmospheric dispersion using the Gaussian plume model. Given the wind direction, the wind speed and the atmospheric stability, the code calculates the dispersion coefficient and the corresponding concentration of fission products in the air and on the ground surface. The effect of atmospheric stability change with transport distance is also incorporated into the code. Besides the simulation of atmospheric dispersion, a visualization technique is under development and the part of the results is shown here. When the model for the evaluation of fission product concentration is married with this visualization technique, this system can allow users to see the Level 3 PSA results easily on a PC screen. (Author).

7757 (KAERI/RR–1383/93) **A study on the ocean circulation and thermal diffusion near a nuclear power plant.** Shu, Kyung Suk (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Han, Moon Hee; Kim, Eun Han; Hwang, Won Tae. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Aug 1994. 106p. (In Korean). Order Number DE95612554. Source: OSTI; NTIS; INIS.

The thermal discharge used with cooling water at nuclear power plant is released to a neighbour sea and it is influenced on marine environment. The thermal discharge released from power plant is mainly transported and diffused by ocean circulation of neighbour sea. So the evaluation for characteristics of ocean circulation around neighbour sea is firstly performed. The purpose of this research is primarily analyzed the thermal diffusion in sea around Yongkwang nuclear power plant. For this viewpoint, fundamental oceanographic data sets are collected and analyzed in Yellow sea, west sea of Korea, sea around Yongkwang. The ocean circulation and the effects of temperature increase by thermal discharge are evaluated using these data. The characteristics of tide is interpreted by the analysis of observed tidal elevation and tidal currents. The characteristics of temperature and salinity is investigated by the long-term observation of Korea Fisheries Research and Development Agency and the short-term observation around Yongkwang. (Author).

7758 (PINSTECH–134) **Radiological consequence analysis for upgradation of Pakistan Research Reactor-1 from 9 to 10 MW.** Khan, L.A. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div.); Raza, S.S. Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div. Dec 1993. 30p. Order Number DE95615633. Source: OSTI; NTIS (US Sales Only); INIS.

Radiological consequence analysis has been carried out for upgradation of PARR-I from 9 to 10 MW. A hypothetical loss of coolant accident resulting in core meltdown and release of fission products to the atmosphere has been analyzed. Whole body and thyroid doses have been calculated as a function of time and distance from the containment building. Based on these dose estimates, boundaries of exclusion and low population zones are assessed. (author).

7759 (PINSTECH–136) **Environmental impact of Pakistan Research Reactor-2 following a hypothetical radiological release accident.** Qazi, M.K. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div.); Israr, M. Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div. Mar 1994. 20p. Order Number DE95615634. Source: OSTI; NTIS (US Sales Only); INIS.

7 fig.

The environmental impact of Pakistan Research Reactor-2 (PARR-2) following a hypothetical accident is presented. It is shown that with 100% core meltdown and multiple failures, PARR-2 does not pose any catastrophic consequences. Conservative estimates show that radiation levels in the Low Population Zone (LPZ) adjacent to the PARR-2 building, which in this case is the PINSTECH building, remains below the established limits. (author). 7 fig.

7760 (PNL–10286) **Atmospheric dispersion estimates in the vicinity of buildings.** Ramsdell, J.V. Jr.; Fosmire, C.J. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 49p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005753. Source: OSTI; NTIS; INIS; GPO Dep.

A model describing atmospheric dispersion in the vicinity of buildings was developed for the U.S. Nuclear Regulatory Commission (NRC) in the late 1980s. That model has recently undergone additional peer review. The reviewers identified four areas of concern related to the model and its application. This report describes revisions to the model in response to the reviewers concerns. Model revision involved incorporation of explicit treatment of enhanced dispersion at low wind speeds in addition to explicit treatment of enhanced dispersion at high speeds resulting from building wakes. Model parameters are evaluated from turbulence data. Experimental diffusion data from seven reactor sites are used for model evaluation. Compared with models recommended in current NRC guidance to licensees, the revised model is less biased and shows more predictive skill. The revised model is also compared with two non-Gaussian models developed to estimate maximum concentrations in building wakes. The revised model concentration predictions are nearly the same as the predictions of the non-Gaussian models. On the basis of these comparisons of the revised model concentration predictions with experimental data and the predictions of other models, the revised model is found to be an appropriate model for estimating concentrations in the vicinity of buildings.

7761 (ANL/TD/CP–85106) **Validation of the WIMSD4M cross-section generation code with benchmark results.** Deen, J.R. (Argonne National Lab., IL (United States)); Woodruff, W.L.; Leal, L.E. Argonne National Lab., IL (United States); Oak Ridge National Lab., TN (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ; AC05-84OR21400. (CONF-9409107–7: International meeting on reduced enrichment for research and test reactors, Williamsburg, VA (United States), 18-22 Sep 1994). Order Number DE95004586. Source: OSTI; NTIS; INIS; GPO Dep.

The WIMSD4 code has been adopted for cross-section generation in support of the Reduced Enrichment Research and Test Reactor (RERTR) program at Argonne National Laboratory (ANL). Subsequently, the code has undergone several updates, and significant improvements have been achieved. The capability of generating group-collapsed micro- or macroscopic cross sections from the ENDF/B-V library and the more recent evaluation, ENDF/B-VI, in the ISOTXS format makes the modified version of the WIMSD4 code, WIMSD4M, very attractive, not only for the RERTR

program, but also for the reactor physics community. The intent of the present paper is to validate the WIMSD4M cross-section libraries for reactor modeling of fresh water moderated cores. The results of calculations performed with multigroup cross-section data generated with the WIMSD4M code will be compared against experimental results. These results correspond to calculations carried out with thermal reactor benchmarks of the Oak Ridge National Laboratory (ORNL) unreflected HEU critical spheres, the TRX LEU critical experiments, and calculations of a modified Los Alamos HEU D_2O moderated benchmark critical system. The benchmark calculations were performed with the discrete-ordinates transport code, TWODANT, using WIMSD4M cross-section data. Transport calculations using the XSDRNPM module of the SCALE code system are also included. In addition to transport calculations, diffusion calculations with the DIF3D code were also carried out, since the DIF3D code is used in the RERTR program for reactor analysis and design. For completeness, Monte Carlo results of calculations performed with the VIM and MCNP codes are also presented.

7762 (ANL/TD/CP–85107) **Postirradiation examination of a low enriched U_3Si_2-Al fuel element manufactured and irradiated at Batan, Indonesia.** Suripto, A. (National Atomic Energy Agency, Serpong (Indonesia). Nuclear Fuel Element Center); Sugondo, S.; Nasution, H.; Hofman, G.L. Argonne National Lab., IL (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States);International Atomic Energy Agency, Vienna (Austria). DOE Contract W-31109-ENG-38. (CONF-9409107–5: International meeting on reduced enrichment for research and test reactors, Williamsburg, VA (United States), 18-22 Sep 1994). Order Number DE95004585. Source: OSTI; NTIS; INIS; GPO Dep.

The first low-enriched U_3Si_2-Al dispersion plate-type fuel element produced at the Nuclear Fuel Element Center, BATAN, Indonesia, was irradiated to a peak ^{235}U burnup of 62%. Postirradiation examinations performed to data shows the irradiation behavior of this element to be similar to that of U_3Si_2-Al plate-type fuel produced and tested at other institutions. The main effect of irradiation on the fuel plates is a thickness increase of 30–40 μm (2.5-3.0%). This thickness increase is almost entirely due to the formation of a corrosion layer (Boehmite). The contribution of fuel swelling to the thickness increase is rather small (less than 10 μm) commensurate with the burnup of the fuel and the relatively moderate as-fabricated fuel volume fraction of 27% in the fuel meat.

7763 (ANL/TD/CP–85125) **Relative performance properties of the ORNL Advanced Neutron Source Reactor with reduced enrichment fuels.** Bretscher, M.M.; Deen, J.R.; Hanan, N.A.; Matos, J.E.; Mo, S.C.; Pond, R.B.; Travelli, A.; Woodruff, W.L. Argonne National Lab., IL (United States). [1994]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409107–4: International meeting on reduced enrichment for research and test reactors, Williamsburg, VA (United States), 18-22 Sep 1994). Order Number DE95004582. Source: OSTI; NTIS; INIS; GPO Dep.

Three cores for the Advanced Neutron Source reactor, differing in size, enrichment, and uranium density in the fuel meat, have been analyzed. Performance properties of the reduced enrichment cores are compared with those of the HEU reference configuration. Core lifetime estimates suggest that none of these configurations will operate for the design goal of 17 days at 330 MW. With modes increases in fuel density and/or enrichment, however, the operating lifetimes of the HEU and MEU designs can be extended to the desired length. Achieving this lifetime with LEU fuel in any of the three studies cores, however, will require the successful development of denser fuels and/or structural materials with thermal neutron absorption cross sections substantially less than that of Al-6061. Relative to the HEU reference case, the peak thermal neutron flux in cores with reduced enrichment will be diminished by about 25–30%.

7764 (BNL–52443) **Material unaccounted for at the Southwest Experimental Fast Oxide Reactor: The SEFOR MUF.** Higinbotham, W.A. Brookhaven National Lab., Upton, NY (United States). 7 Nov 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95005653. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Atomic Energy Commission contracted with the General Electric Company to design, construct, and operate the Southwest Experimental Fast Oxide Reactor (SEFOR) to measure the Doppler effect for fast neutron breeder reactors. It contracted with Nuclear Fuel Services to fabricate the fuel rods for the reactor. When the reactor went critical in May, 1969, it appeared that some of the mixed uranium-plutonium oxide (MOX) fuel rods did not contain the specified quantity of plutonium. The SEFOR operators soon found several fuel rods which appeared to be low in plutonium. The safeguards group at Brookhaven was asked to look into the problem and, if possible, determine how much plutonium was missing from the unirradiated rods and from the larger number which had been slightly irradiated in the reactor. It was decided that the plutonium content of the unirradiated and irradiated rods could be measured relative to a reference rod using a high resolution gamma-ray detector and also by neutron measurements using an auto-correlation circuit recently developed at the Naval Research Laboratory (NRL). During the next two years, Brookhaven personnel and C.V. Strain of NRL made several trips to the SEFOR reactor. About 250 of the 775 rods were measured by two or more methods, using a sodium-iodide detector, a high-resolution germanium detector, a neutron detector, or the reactor (to measure reactivity). The research team concluded that 4.6 $\pm$ 0.46 kg of plutonium was missing out of the 433 kg that the rods should have contained. This report describes the SEFOR experiment and the procedures used to determine the material unaccounted for, or MUF.

7765 (CONF-9404227–1) **Results of the MCNP analysis of 20/20 LEU fuel for the Oregon State University TRIGA Reactor.** Dodd, B.; Klein, A.C.; Lewis, B.R.; Merritt, P.A. Oregon State Univ., Corvallis, OR (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER75747. From 14. TRIGA users conference; San Diego, CA (United States); Apr 1994. Order Number DE95003934. Source: OSTI; NTIS; GPO Dep.

The Monte Carlo Neutron/Photon (MCNP) code has been used to perform the neutronics analysis required to support revision of the Oregon State University TRIGA Reactor (OSTR) Safety Analysis Report (SAR). The SAR revision is a necessary part of the preparation of the application for authorization to convert the OSTR core from High Enriched Uranium (HEU) FLIP fuel to a Low Enriched Uranium (LEU) fuel. Before MCNP was applied to LEU-fueled cores, it was first validated by comparing MCNP calculations on FLIP cores to historical, measured values for these cores. The LEU fuel considered was the 20 wt%, 20% enriched (20/20) TRIGA fuel approved by the Nuclear Regulatory Commission (NRC) in NUREG 1282. The results show that the 20/20 fuel is much more reactive than FLIP fuel. A just-critical OSTR FLIP core contains 65 elements, while a just-critical 20/20 core only needs 51 elements. Similarly, the current operational FLIP core consists of 88 elements, whereas a 20/20 core giving the same core excess only requires 65 elements. This presents a significant problem for the OSTR because of potentially significant neutron flux loss in experimental facilities. Further analysis shows that to achieve a full size operational core of about 90 LEU elements the erbium content of the LEU fuel would need to be increased from 0.47wt% to about 0.85 wt%.

7766 (DOE/ER/79214–1) **Laboratory instrumentation modernization at the WPI Nuclear Reactor Facility.** Worcester Polytechnic Inst., MA (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-93ER79214. Order Number DE95004440. Source: OSTI; NTIS; INIS; GPO Dep.

With partial funding from the Department of Energy (DOE) University Reactor Instrumentation Program several laboratory instruments utilized by students and researchers at the WPI Nuclear Reactor Facility have been upgraded or replaced. Designed and built by General Electric in 1959, the open pool nuclear training reactor at WPI was one of the first such facilities in the nation located on a university campus. Devoted to undergraduate use, the reactor and its related facilities have been since used to train two generations of nuclear engineers and scientists for the nuclear industry. The low power output of the reactor and an ergonomic

facility design make it an ideal tool for undergraduate nuclear engineering education and other training. The reactor, its control system, and the associate laboratory equipment are all located in the same room. Over the years, several important milestones have taken place at the WPI reactor. In 1969, the reactor power level was upgraded from 1 kW to 10 kW. The reactor's Nuclear Regulatory Commission operating license was renewed for 20 years in 1983. In 1988, under DOE Grant No. DE-FG07-86ER75271, the reactor was converted to low-enriched uranium fuel. In 1992, again with partial funding from DOE (Grant No. DE-FG02-90ER12982), the original control console was replaced.

7768 (INIS-mf–14437-Vol.3) **Vol. 3: Research and experimental reactors.** Bezpecnost Jadernych Zarizeni, no.4. Matejka, K. (ed.) (Ceske Vysoke Uceni Technicke, Prague (Czech Republic). Fakulta Jaderna a Fysikalne Inzenyrska); Fleischhans, J.; Hejzlar, R. No corporate text available. Jun 1994. 449p. (In Czech). Order Number DE95615954. Source: OSTI; NTIS (US Sales Only); INIS.

The various types of research, experimental and training reactors are described. In addition to their categorization with respect to various technical aspects and to reactor utilization, attention is paid to the research reactor fuel, to control and protection systems, neutron detectors, and dosimetric systems. (J.B.). 17 figs., 10 refs.

7769 (INIS-mf–14437-Vol.4-Pt.1) **Vol. 4: Technical descriptions of Czechoslovak research reactors. Part 1. Technical description of the LVR-15 reactor.** Bezpecnost Jadernych Zarizeni, no.4. Matejka, K. (ed.) (Ceske Vysoke Uceni Technicke, Prague (Czech Republic). Fakulta Jaderna a Fysikalne Inzenyrska); Fleischhans, J.; Hejzlar, R. No corporate text available. Jun 1994. 449p. (In Czech). Order Number DE95615955. Source: OSTI; NTIS (US Sales Only); INIS.

The main design and operating parameters of the LVR-15 research reactor are given and the reactor components are described, including the coolant circuits, coolant makeup and purification system, control and protection system, the UR 70 control rod, the electricity supply system, reactor ventilation system, IRT-2M type fuel, unirradiated fuel storage, irradiated fuel and radioactive waste handling, experimental equipment, and backup systems. Dosimetric protection of the reactor rooms is also dealt with. The reactor is accommodated in a pressureless vessel under a shielding lid, with forced cooling. IRT-2M fuel with 80% ^{235}U enrichment is used. The reactor is employed for loop and probe experiments, particularly for materials and physico-metallurgical research, experiments on horizontal channels, irradiating services, neutron activation analyses and neutron radiography, nuclear reactor operator training, and practical teaching exercises. (J.B.). 3 tabs., 11 figs., 6 refs.

7770 (INIS-mf–14437-Vol.4-Pt.3) **Vol. 4: Technical descriptions of Czechoslovak research reactors. Part 3. Technical description of the VR-1 reactor.** Bezpecnost Jadernych Zarizeni, no.4. Matejka, K. (ed.) (Ceske Vysoke Uceni Technicke, Prague (Czech Republic). Fakulta Jaderna a Fysikalne Inzenyrska); Fleischhans, J.; Hejzlar, R. No corporate text available. Jun 1994. 449p. (In Czech). Order Number DE95615956. Source: OSTI; NTIS (US Sales Only); INIS.

This part deals with the VR-1 training reactor operated by the Faculty of Nuclear Science and Physical Engineering, Czech Technical University in Prague. The UR-70 control rod and its involvement in the control facility are described. IRT-2M type fuel is employed in the reactor. The reactor control system is outlined. Attention is also paid to water management and water purification. The Am-Be neutron source of the reactor is described and its function explained. The dosimetric system, feed system, ventilation system, waste management system, and communication and backup systems are outlined as well. The experimental equipment of the reactor is described. (J.B.). 2 tabs., 8 figs., 41 refs.

7771 (KAERI/RR–1286/93) **A study on the decommissioning of research reactor.** Suh, Doo Whan (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Park, Sang Joon; Hong, Kwang Pyo; Sim, Byeong Seop. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jan 1993. 79p. (In Korean). Order Number DE95612943. Source: OSTI; NTIS; INIS.

As the result of study on decommissioning, discussion has made and data have been collected about experiences, plannings, and techniques for decommissioning through visit to GA and JAERI. GA supplied our Research Reactor No. 1 and No. 2, and JAERI made a memorial museum after dicommissioning of JRR-1 and is dismentling JPDR now. Also many kinds of documents are collected and arranged such as documents related to TRIGA reactor dicommissioning, 30 kinds of documents including decommissioning plan, technical criteria and related regulatory, and 1,200 kinds of facility description data. (Author).

This project was carried out in order to localize the fuel production and to develop the atomized uranium silicide fuels. In the fabrication part, the fuel meat was successfully cladded with good contact between meat and clad through extrusion die modification and properly controlling of extrusion parameters. The electron beam welding parameters were established properly so that the strength of welding zone showed to be same as the clad strength. The fabricating and assembling technologies of the fuel assembly have been developed and applied to the fabrication of dummy fuels. The development of coating technology on the surface of graphite crucible reduced the carbon contamination in atomized powder. In fuel performance testing part, the thermal reaction swelling tests were carried out. The results showed that the atomized fuel meat swells 30 - 40 % lower than pulverized fuel meat. The corrosion test revealed that the thickness of oxide layer ranges within the criteria of fuel safe requirement. In the fuel design part, the design criteria have been established with evaluating KMRR fuel material characteristics with respect to KMRR operation. In the hydraulic testing part, the modification of test facility and the development of the measuring instrument and data aquisition system were performed. The preliminary testing results with dummy fuels fabricated by our research team showed that the developed system works normally and the results is almost same as AECL results. (Author).

The objective of this study is to design and construct the steady state fuel test loop and non-instrumented capsules to be installed in KMRR. The principle contents of this project are to design, fabricate the steady-state fuel test loop and non-instrumented capsule to be installed in KMRR for nuclear technology development. This project will be completed in 1996, so preparation of design criteria for fuel test loop have been performed in 1993 as the first year of the first phase in implementing this project. Also design and pressure drop test of non-instrumented capsule have been performed in 1993.

It's been 30 years since to start RI and labelled compound production in this country. But it is so limited to certain nuclide due to small research reactor and its RI production facilities. In order to upgrade and expand RI, it is necessary to operate high neutron flux reactor and advanced RI production facilities. KMRR, power is 30 MW_{th} and maximum thermal neutron flux is 5 x 10^{14} n/cm^2sec, is under construction and it will be completed on the end of this year. Building and basic facility for RI production were included in KMRR project but hot cell and its equipment were not. It is urged to complete RI production facilities to produce RI for medical and industrial use. Design of RI production facility was done with KAERI's 30 years accumulated experiences and reference of many advanced country's facilities. Most of equipments and components for RI facility were made and installed by domestic suppliers except a few special items. Some part of RI production facility will be completed before KMRR operation, this means will contribute RI demend for the country and KMRR utilization. Basic civil structure for RI production such as building, concrete hot cells, source storage pool and basic utility system is part of the KMRR project. Basic equipment and components for 4 concrete hot cells, 17 lead hot cells and its equipment, purification system for Co-60 source storage pool, ventilation system, radiation monitoring system, and fire protection system are under this project. The followings were carried out during second year of the project period. Installation on the first year's manufacturing order: (1) Install overhead crane (2 tons) at inside of concrete hot cell (2) Manipulator performance test for lead hot cell (3) Radiation shielding window performance test for lead hot cell. Place manufacturing order for developed items: (1) Select qualified vendor and fabricate for led hot cell (2) Select qualified vendor and fabricate for HTS.

7775 (PINSTECH–131) **Delayed neutron monitoring system for fuel failure detection at PARR-1.** Ayazuddin, S.K. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div.); Ahmed, T.; Perez, S. Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div. Jul 1993. 16p. Order Number DE95615958. Source: OSTI; NTIS (US Sales Only); INIS.

8 fig.

Fuel failure detection is important from the point of view of the safety of nuclear reactors. After the conversion and upgradation of Pakistan Research Reactor-1 (PARR-1), it was desired to install a fuel failure detection system to confirm the performance and integrity of the new fuel elements. The fuel failure detection system is based on monitoring of delayed neutrons emitted from fission products leaking into the primary coolant loop from the fuel. For this purpose two neutron detectors (BF3) were placed in the graphite moderator blocks which were installed at the outlet coolant pipe in the valve pit. The graphite blocks were enclosed in lead shield and polyethylene to reduce background due to gamma and neutrons. (author). 8 fig.

7776 (PINSTECH–132) **Neutronic analysis for upgradation of Pakistan Research Reactor-1 from 9 to 10 MW.** Liaquat, L.A. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div.). Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div. Dec 1993. 23p. Order Number DE95615959. Source: OSTI; NTIS (US Sales Only); INIS.

In connection with upgradation of PARR-1 from 9 to 10 MW, the effects of enhanced power on various neutronic parameters have been investigated. These include: neutron energy spectrum, absolute and relative flux, control rod of worth and shutdown margin, fission product poisons, kinetic parameters, temperature coefficients of reactivity, fuel burnup and core excess reactivity. Results indicate that the reactor operation at 10 MW will improve neutron flux levels without compromising on reactor safety. (author).

7777 (PINSTECH–133) **Thermal hydraulic analysis for upgradation of Pakistan Research Reactor-1 from 9 to 10 MW.** Khan, L.A. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div.). Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Engineering Div. Dec 1993. 17p. Order Number DE95615960. Source: OSTI; NTIS (US Sales Only); INIS.

Thermal hydraulic aspects of Pakistan Research Reactor-1 have been studied to upgrade its power level from 9 to 10 MW. Standard computer codes and correlations were used to compute: pressure drop and flow through different channels of the core, coolant critical velocity beyond which fuel plates may collapse, temperature distribution in the core, heat fluxes at onset of nucleate boiling, onset of flow instability and departure from nucleate boiling. Natural convection cooling at low power was also analyzed. Results indicate that the cores have reasonably high safety margins and reactor power can be upgraded to 10 MW without compromising on reactor safety. (author).

7778 (PINSTECH-HPD–143) **Sector emergency procedures for Pakistan Research Reactor-1 (PARR-1) PINSTECH.** Aziz, A. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Health Physics Div.); Aslam, M.; Faruq, M.U.; Ahmad, B.; Hasan, S.; Lodhi, N.P.K. Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Health Physics Div. Dec 1992. 44p. Order Number DE95615957. Source: OSTI; NTIS (US Sales Only); INIS.

A plan for handling of the radiation emergency situation prevailing outside PINSTECH has been incorporated in this report. This report outlines the detailed procedures and collective responsibilities and actions to be undertaken for meeting the emergency situation. These procedures include announcement/notification of emergency, evaluation of emergency, control of access and aggress, personnel monitoring and internal dosimetry, medical care of injured etc. A summary of the role and responsibilities of PINSTECH and the public organisations during a sector emergency at PINSTECH has been included as an appendix. (Orig./A.B.).

7779 (PINSTECH-NPD–136) **Contributions of research Reactors in science and technology.** Butt, N.M. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Physics Div.); Bashir, J. Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Nuclear Physics Div. Dec 1992. 30p. Order Number DE95615650. Source: OSTI; NTIS (US Sales Only); INIS.

In the present paper, after defining a research reactor, its basic constituents, types of reactors, their distribution in the world, some typical examples of their uses are given. Particular emphasis in placed on the contribution of PARR-I (Pakistan Research Reactor-I), the 5 MW Swimming Pool Research reactor which first became critical at the Pakistan Institute of Nuclear Science and Technology (PINSTECH) in Dec. 1965 and attained its full power in June 1966. This is still the major research facility at PINSTECH for research and development. (author).

7780 (BNL–60744) **Organizational factors and nuclear power plant safety.** Haber, S.B. Brookhaven National Lab., Upton, NY (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9410264–1: International conference on human factors research in nuclear power operation, Berlin (Germany), 31 Oct - 2 nov 1994). Order Number DE95004231. Source: OSTI; NTIS; INIS; GPO Dep.

There are many organizations in our society that depend on human performance to avoid incidents involving significant adverse consequences. As our culture and technology have become more sophisticated, the management of risk on a broad basis has become more and more critical. The safe operation of military facilities, chemical plants, airlines, and mass transit, to name a few, are substantially dependent on the performance of the organizations that operate those facilities. The nuclear power industry has, within the past 15 years, increased the attention given to the influence of human performance in the safe operation of nuclear power plants (NPP). While NPPs have been designed through engineering disciplines to intercept and mitigate events that could cause adverse

consequences, it has been clear from various safety-related incidents that human performance also plays a dominant role in preventing accidents. Initial efforts following the 1979 Three Mile Island incident focused primarily on ergonomic factors (e.g., the best design of control rooms for maximum performance). Greater attention was subsequently directed towards cognitive processes involved in the use of NPP decision support systems and decision making in general, personnel functions such as selection systems, and the influence of work scheduling and planning on employees' performance. Although each of these approaches has contributed to increasing the safety of NPPS, during the last few years, there has been a growing awareness that particular attention must be paid to how organizational processes affect NPP personnel performance, and thus, plant safety. The direct importance of organizational factors on safety performance in the NPP has been well-documented in the reports on the Three Mile Island and Chernobyl accidents as well as numerous other events, especially as evaluated by the U.S. Nuclear Regulatory Commission (NRC).

The FAR Manual is a convenient easy-to-use collection of the functions, assignments, and responsibilities (FARs) of DOE nuclear safety personnel. Current DOE directives, including Orders, Secretary of Energy Notices, and other assorted policy memoranda, are the source of this information and form the basis of the FAR Manual. Today, the majority of FARs for DOE personnel are contained in DOE's nuclear safety Orders. As these Orders are converted to rules in the Code of Federal Regulations, the FAR Manual will become the sole source for information relating to the functions, assignments, responsibilities of DOE nuclear safety personnel. The FAR Manual identifies DOE directives that relate to nuclear safety and the specific DOE personnel who are responsible for implementing them. The manual includes only FARs that have been extracted from active directives that have been approved in accordance with the procedures contained in DOE Order 1321.1B.

7784 (DTU-AEF-NT–11) **Potential risks of nuclear ships.** Oelgaard, P.L. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Elektrofysik. Jul 1994. 22p. Order Number DE95612954. Source: OSTI; NTIS; INIS.

This report represents an attempt to evaluate the potential risks of nuclear ships. Firstly reasons are given why nuclear ship accidents will not lead to accidents of the magnitude of the Chernobyl accident. This is due to much lower content of radioactive material and to different reactor designs. Next a review is given of the types of accidents which have actually occurred. Of these the reactor accidents which may lead to serious consequences for the crew and the environment are considered further. These are reactivity accidents and loss of coolant accidents. In addition the long term risks of sunken nuclear ships and sea disposed reactor compartments etc. are also discussed. Based on available accident data an attempt is made to estimate the probability of serious nuclear ship accidents. (au).

7785 (HMI-B–516) **Radiological effects of an aircraft crash into the BER II research reactor. Comparison of effects for HEU and LEU fuels.** Axmann, A. (Hahn-Meitner-Institut Berlin GmbH (Germany). Zentralabteilung Reaktor); Boehnert, R.; Ehrhardt, J.; Hasemann, I.; Roedder, P. Hahn-Meitner-Institut Berlin GmbH (Germany). Zentralabteilung Reaktor; Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Roedder (Peter) Ingenieurberatung, Aachen (Germany). Mar 1994. 77p. (In German). Order Number DE95738773. Source: OSTI; NTIS (US Sales Only); INIS.

Within the framework of the approval procedure for conversion from high enriched uranium (HEU, ca. 90% U-235, UAl_4-Al) to low enriched uranium (LEU, ca. < 20% U-235, U_3Si_2-Al, dispersion fuel), a verification was made for the BER II, whether or not and in how far this would have any influence on the previously known potential risk of the research reactor in case of any involvement in the crash of a high-speed military aircraft. In addition to this, the influence of the UFOMOD (effective 1984) and the current COSYMA program systems on an estimate of accident consequences were investigated. For this purpose a LEU source term was determined for activity release in case of a drained, melting core (27.4 fuel rods as compared to 34.4 in a HEU core). Updated accident consequence assessments were also carried out for the former HEU source term. (HP)

7786 (IAEA-TECDOC–766, pp. 21-28) **Safety principles for plutonium facilities in France.** Mercier, J.P. (CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France). Inst. de Protection et de Surete Nucleaire). International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310405–: Technical committee meeting on safe handling, transport and storage of plutonium, Vienna (Austria), 18-21 Oct 1993). In *Safe handling, transport and storage of plutonium. Proceedings of a technical committee meeting held in Vienna, 18-21 October 1993.* 120p. Order Number DE95614900. Source: OSTI; NTIS (US Sales Only); INIS.

Safety problems specific to the use of plutonium arise as a result of the radiotoxicity of the majority of its isotopes and their fissile nature. Measures intended to ensure safety during normal operations are homogeneous with those now adopted in the fuel cycle and particularly in the reprocessing facilities: protection from ionizing radiation by the emplacement of special shields; special attention is paid to protection from neutrons, confinement of radioactive material by the implementation of several containment systems, each comprising one or more barriers, limitation of the production and activity of liquid effluent by decontaminating and recycling fissile material, limitation of the production of solid radioactive waste containing α emitters, limitation of their specific activity, use of appropriate packaging. As far as accident mitigation is concerned, the safety of the facilities is based on the 'defence-in-depth' concept: prevent the occurrence of events which might initiate incidents thorough the high quality of design, construction and control of processes, and to prevent accidents by limiting the probability of their occurring and the vulnerability of installations, as well as limiting consequences by remedial measures. In the case of facilities using plutonium and fissile materials, safety is particularly based on mitigating the risk of criticality. With regard to the other risks, it is essential to avoid initiating events which could lead to the dispersion of fissile material into the facilities and the environment.

7787 (INIS-mf–15079) **Drill core investigations from the TMI-2 pressure vessel. Final report.** Sturm, D.; Katerbau, K.H.; Maile, K.; Ruoff, H. Stuttgart Univ. (Germany). Staatliche Materialpruefungsanstalt. Jan 1994. 268p. (In German, English). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 1500833; Project Number MPA 871500000. Order Number DE95738688. Source: OSTI; NTIS (US Sales Only); INIS.

For the evaluation of the results obtained in TMI-2 VIP and for the preparation of the continuing discussion in the OECD and of research measures in the national sphere but also for the appraisal of the effect of the results to date on safety philosophy and safety research in Germany, the present research project, inter alia, was commenced. In content was: (a) Furtherance of the OECD-NEA-TMI-2 Vessel Investigation Project in dealing with the testing programme by active collaboration in the Programme Review Group, by participation in ad-hoc meetings on the question of specimen extraction, by advice on the conduct of metallographic, metallurgical and mechanical investigations on the specimens from the RPV bottom head and by assessment of the findings. (b) Investigation of specimens from the bottom head of the TMI-2 reactor pressure vessel. (c) Investigation of specimens from archive material. The investigations reach the widely agreed conclusion that during the accident a hot spot developed in the bottom head of the reactor in which for a time of about 30 minutes a maximum temperature of some 1100 C or greater than 900 C prevailed. Around this zone there is a region with temperatures higher than ca. 730 C (A_1) whilst the predominant portion of the head had not been heated beyond the $_1$ temperature. (orig.)

7788 (KFK–5326) **Papers presented as part of the status report of the Nuclear Safety Research Project of the Karlsruhe Nuclear Center on 23 March 1994.** Hueper, R. (comp.). Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. 284p. (In German). (CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). Order Number DE95738354. Source: OSTI; NTIS (US Sales Only); INIS.

The ten papers deal with the state of safety requirements on future LWR plants and with nuclear safety research with regard to fast reactors and future PWR plants. In particular, passive after-heat removal, core disruptive accidents, and actinide burning in fast reactors are analysed. For PWR type plants the fuel element behaviour in the event of accidents, hydrogen distribution and hydrogen fires, and the origin and effects of steam explosions on the reactor pressure vessel and the containment are examined. Core meltdown cooling systems are suggested. (DG)

7789 (KFK–5326, pp. 1-14) **Safety requirements on future LWR plants.** Kessler, G. (INR, Kernforschungszentrum Karlsruhe (Germany)). Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. (In German). (CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). In *Papers presented as part of the status report of the Nuclear Safety Research Project of the Karlsruhe Nuclear Center on 23 March 1994.* 284p. Order Number DE95738354. Source: OSTI; NTIS (US Sales Only); INIS.

If complied with, the listed safety requirements on future PWR type reactors will lead to a considerable increase in safety standards. Even in the event of core meltdown or core disruption within the containment, no drastic measures, such as evacuation, will have to be taken. Concepts of cooling the molten core and impeding its meltdown exist. Concepts of long-term after-heat removal - as shown in the case of the AP 600 - are technically feasible. (DG)

7790 (KFK–5326, pp. 15-32) **The R and D program of the Nuclear Safety Research Project.** Heusener, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. (In German). (CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). In *Papers presented as part of the status report of the Nuclear Safety Research Project of the Karlsruhe Nuclear Center on 23 March 1994.* 284p. Order Number DE95738354. Source: OSTI; NTIS (US Sales Only); INIS.

The paper deals with the tasks of the Nuclear Safety Research project run by Karlsruhe, Nuclear Research Center. After stopping work on the EFR in 1993, research concentrates on the key problems of safety of large PWR plants, in particular the EPR. Problems involved are outlined. (DG)

7791 (KFK–5326, pp. 33-73) **Studies of passive after-heat removal for fast reactors.** Hoffmann, H. (Institut fuer Angewandte Thermo- und Fluiddynamik, Kernforschungszentrum Karlsruhe (Germany)); Wilhelm, D.; Weinberg, D. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. (In German). (CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). In *Papers presented as part of the status report of the Nuclear Safety Research Project of the Karlsruhe Nuclear Center on 23 March 1994.* 284p. Order Number DE95738354. Source: OSTI; NTIS (US Sales Only); INIS.

The studies served to prove that the after-heat may be removed by natural convection without inadmissibly stressing the structures. To describe this thermohydraulic system behaviour, one- and multi-dimensional computer codes were used. The computer calculation codes were supported by experiments. Studies of natural convection in the primary system were performed by the RAMONA, NEPTUN and KIWA models. The FLUTAN computer calculation code was validated for laminar, buoyant flows. (orig./DG)

7792 (KFK–5326, pp. 74-114) **Analysis of core disruptive accidents in fast reactors.** Struwe, D. (Kernforschungszentrum Karlsruhe GmbH (KfK) (Germany). Inst. fuer Reaktorsicherheit (IRS)); Maschek, W. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. (In German). (CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). In *Papers presented as part of the status report of the Nuclear Safety Research Project of the Karlsruhe Nuclear Center on 23 March 1994.* 284p. Order Number DE95738354. Source: OSTI; NTIS (US Sales Only); INIS.

To determine the consequences of core disruptive accidents in metal cooled reactors, methods secured by experiments were made available which enable a realistic description, as far as possible, of the sequence of events. Regarding the first stage of a core disruptive accident, this can be done today with sufficient accuracy. As regards the later accident stages, such as the transition phase, the phase of large-scale material movements and mild discharge, and the expansion phase, insecurities naturally increase in view of a more extensive core disruption. In these areas of accident analysis an overall conservatively oriented approach is still required. Inspite of this, the influences of plant-specific design characteristics may securely be determined nowadays, and particulars can be given of the thermal and mechanical loads of the reactor vessel, its internals, and of the vessel closure head structures, as a consequence of core disruptive accidents. (orig./DG)

7793 (KFK–5326, pp. 132-166) **CORA results concerning LWR fuel element behaviour in the event of severe reactor accidents.** Hofmann, P. (Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung); Schanz, G.; Hagen, S.; Noack, V.; Sepold, L. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. (In German). (CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). In *Papers presented as part of the status report of the Nuclear Safety Research Project of the Karlsruhe Nuclear Center on 23 March 1994.* 284p. Order Number DE95738354. Source: OSTI; NTIS (US Sales Only); INIS.

In the framework of the CORA program the chemical interactions among fuel element (core) materials that may occur with increasing temperature up to complete melting have been examined. The high-temperature material behavior of PWR, BWR, and VVER-1000 fuel rod bundles has been studied in large-scale integral experiments and extensive separate-effects tests. In many cases, the reaction products are liquid at temperatures above 1200 C or have lower eutectic melting points than their original components. (orig./DG)

7794 (KFK–5326, pp. 167-213) **Studies of distribution and combustion of hydrogen in PWR type plants.** Breitung, W. (Kernforschungszentrum Karlsruhe (Germany)); Redlinger, R.; Royl, P. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. (In German).

(CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). In *Papers presented as part of the status report of the Nuclear Safety Research Project of the Karlsruhe Nuclear Center on 23 March 1994.* 284p. Order Number DE95738354. Source: OSTI; NTIS (US Sales Only); INIS.

The project aims at determining possible loads on buldings due to hydrogen combustion in the event of severe, core disruptive accidents. The results obtained serve to further develop containment concepts and optimize possible hydrogen disintegration measures (e.g. igniters) for future light water reactors. Partial results have been achieved in the field of detonation ignition criteria with regard to ignition by means of a turbulent open jet, compression wave focussing, and flame acceleration. Reaction kinetics of complex accident atmospheres was studied in preliminary experiments and theoretically interpreted. (orig./DG)

7795 (KFK–5326, pp. 214-232) **Studies into steam explosion scenarios.** Jacobs, H. (INR, Kernforschungszentrum Karlsruhe (Germany)); Meyer, L.; Schuetz, W. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. (In German). (CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). In *Papers presented as part of the status report of the Nuclear Safety Research Project of the Karlsruhe Nuclear Center on 23 March 1994.* 284p. Order Number DE95738354. Source: OSTI; NTIS (US Sales Only); INIS.

If large amounts of core melt are mixed with water, a steam explosion may cause damage which, in an extreme case, may lead to early containment failure. At the Karlsruhe Nuclear Research Center, theoretical (calculation program IVA-KA) and experimental studies (QUEOS and PREMIX), tuned to each other, are prepared by which realistic, conservative upper limits for mechanical loads caused by steam explosions are to be determined. (orig.)

7796 (KFK–5326, pp. 233-248) **Loads affecting the reactor pressure vessel in the event of a steam explosion.** Krieg, R. (Institut fuer Reaktorsicherheit, Kernforschungszentrum Karlsruhe (Germany)); Schleisiek, K. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. (In German). (CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). In *Papers presented as part of the status report of the Nuclear Safety Research Project of the Karlsruhe Nuclear Center on 23 March 1994.* 284p. Order Number DE95738354. Source: OSTI; NTIS (US Sales Only); INIS.

It is assumed that by a strong in-vessel steam explosion up to 80 000 kg of core melt are thrown upwards against the still existing upper internals and the vessel closure head. That could cause a closure head fracture or rupture, and large parts could crash into the containment wall and damage it. Slug-impact experiments are intended to show that thereby way no inadmissible leakages are caused in the containment. (orig./DG)

7797 (KFK–5326, pp. 249-280) **Molten core cooling systems for future PWR plants.** Alsmeyer, H. (Kernforschungszentrum Karlsruhe (Germany)); Werle, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. May 1994. (In German). (CONF-9403194–: Status report of Projekt Nukleare Sicherheitsforschung (PSF) of Kernforschungszentrum Karlsruhe GmbH (KfK), Karlsruhe (Germany), 23 Mar 1994). Source: OSTI; NTIS (US Sales Only); INIS.

The three concepts of cooling core melts outside the reactor pressure vessel which were studied by the KfK are designed to remove the after-heat through direct contact with water. To this effect, the melt surface is enlarged by geometrical distribution in such a way as to produce favourable conditions for heat removal from the poorly heat conducting melt which then starts to rapidly and completely consolidate. However, since in the case of direct contact of melt with water strong interactions in the form of limited steam explosions cannot be excluded, an important objective is the experimental determination of possibly caused mechanical loads. (orig.)

7798 (KFK–5327) **Safety-related LWR research. Annual report 1993.** Hueper, R. (comp.). Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. 251p. (In German, English). Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

The reactor safety R and D work of the Karlsruhe Nuclear Research Centre (KfK) has been part of the Nuclear Safety Research Project (PSF) since 1990. The present annual report 1993 summarizes the results on LWR safety. The research tasks are coordinated in agreement with internal and external working groups. The contributions to this report correspond to the status at the end of 1993. (orig./HP)

7799 (KFK–5327, pp. 1-45) **Studies of hydrogen distribution and combustion in PWR plants.** Breitung, W.; Redlinger, R.; Royl, P. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

During the reporting period the emphasis of the research program on hydrogen combustion at KfK and its external partners was an investigation of pressure loads from fast hydrogen-air combustion processes, like accelerated flames and deflagration-to-detonation transitions. The important physical processes and load parameters are summarized and then two experimental series are described which were performed to broaden the data base for fast combustion-generated pressure loads towards more reactortypical severe accident conditions. (orig.)

7800 (KFK–5327, pp. 46-51) **Premix experiments.** Huber, F.; Peppler, W.; Will, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

After a core meltdown due to an uncontrolled LOCA, liquid fuel can penetrate into the lower coolant plenum, presumably through the openings of the grid plate. The jets of core material might mingle with residual water, which would not exclude the possibility of a steam explosion. In such a case the mechanical energy release would depend on the quantities of premixed materials. This premixing is a precondition for a coherent thermal interaction. Statements about a possible failure of RPV or containment integrity require a detailed knowledge of those phenomena. KfK is therefore performing numerous experimental and theoretical studies of mixing phenomena. (orig.)

7801 (KFK–5327, pp. 52-61) **Mechanical loads on the RPV.** Goeller, B.; Hailfinger, G.; Hoffmann, G.; Jonatzke, O.; Krieg, R.; Malmberg, T.; Schleisiek, K.; Stratmanns, E. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

Energy assessments have been discussed for a molten fuel slug impact on the upper pressure vessel structures. In order to obtain more definite results, also the momentum transfer has been considered from the molten fuel slug to the vessel head. It turns out that the interaction between the slug flow and the collapsing upper core structures play an important role. Estimates are presented for the slug resistance of the vessel head. Finally, the model experiments BERDA are described which are indispensable for a reliable solution of this problem. (orig.)

7802 (KFK–5327, pp. 62-70) **Steam explosion, premixing experiments with solid spheres.** Huber, R.; Kuhn, D.; Mensinger, E.; Meyer, L.; Rehme, K.; Schumacher, G.; Woerner, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

Experiments are performed with solid spheres at high temperatures to establish a data base for the premixing phase of a steam

explosion, which will be used for code improvement and validation. The hot spheres ($T \leq 2600$ K) are dropped into saturated water at 1 bar pressure. The objective of the experiments is to obtain data on the cooling rate of the spheres, their distribution in the water, the amount of generated steam and its distribution with respect to the spheres. The spheres have a diameter of 4.2 mm and 4.8 mm, respectively, depending on the material used. Molybdenum coated with rhenium to inhibit oxidation, and ZrO_2 are used. The experimental parameters are the mass flow of the spheres, their density and their temperature. The experiments are performed at two test facilities. At a small test facility (Fig. 2) single spheres (diameter 10-20 mm) or up to 200 small spheres (diameter 4-5 mm) can be heated and cooled in 4 liters of saturated water. The planned QUEOS test facility (Fig. 1) will allow to heat 7000 cm^3 of spheres (about 100 000) and use 500 litres of water with a depth of 1 m. Some typical results from the experiments with a single sphere are presented here. Temperatures are measured with high temperature thermocouples and by pyrometers. Observation by high speed photography shows the vapor film around the sphere and thee periodic growing and detachment of the steam bubbles. The film taken at an experiment with 100 small spheres shows the individual spheres and their vapor wake. (orig.)

7803 (KFK–5327, pp. 71-79) **Theoretical analyses of interactions between core melt and coolant.** Arnecke, G.; Jacobs, H.; Stehle, B.; Thurnay, K.; Vaeth, L.; Lummer, M. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

The code IVA3 will be utilized for analysing the physical processes related to steam explosions, i.e. the premixing phase preceeding the explosion and the explosion itself. The programme models the thermo- and fluiddynamics of multi-phase, three-component systems, esp. the movements of molten material, water and vapour with one velocity field for each of the three components. The following activities are reported on: 1. Modifications of the model and code corrections: An improved model for the heat transfer between the three components has been inserted and a number of code errors were corrected. 2. The programme was made more user-friendly concerning its input, its graphical output and the programme management. 3. A FARO-experiment (investigating the behaviour of molten material falling into water) was recalculated with IVA3 in order to test the new model. The initial pressure increase is very well reproduced by the code, whereas the results at later times indicate a too effective heat transfer and thus the need for some more model refinement. 4. The COMET-experiments planned at KfK are designed to simulate the behaviour of molten core material cooled from below with water. They were precalculated with an intermediate version of IVA3 (June 1993). Recently one of the calculations was repeated with the newest code version. The interaction of melt and water turned out to be much more benign in the new calculation. However, a numerical problem still prevents the calculation to proceed to large times. This problem is being analysed; a recalculation of all experiments will have to be performed after its solution. (orig.)

7804 (KFK–5327, pp. 80-89) **Mechanical loads on internal containment structures.** Jacobs, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

A short account is given of current work to assess the loads of support structures of the RPV and the reactor pit, as a consequence of a hypothetical rupture of the RPV bottom at high pressure. (orig.)

7805 (KFK–5327, pp. 84-89) **Load capacity analysis of RPV failure.** Ritter, B.; Laemmer, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

In case that accident management measures are not sufficient for heat rejection from the RPV, severe core failures and meltdown can result. The present report gives intermediate results of analyses concerning the load capacity and the effects of geometrical and thermal imperfections on deformation behavior of the RPV. (orig.)

7806 (KFK–5327, pp. 90-100) **Studies of core catcher concepts.** Fieg, G.; Moeschke, M.; Werle, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

Underneath the RPV of future PWRs a space is to be provided for a core catcher capable of taking care of the whole core melt. As an alternative to an earlier concept providing for a spread of the core melt on a flat sacrifical bed, we investigate a staggered-pan concept in a particle bed, in which the melt can spread both vertically and horizontally. Such a spatial distribution would make for a better long-term coolability. (orig.)

7807 (KFK–5327, pp. 101-110) **The COMET concept.** Alsmeyer, H.; Tromm, W. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

The COMET core catcher has been conceived to use the sump water resulting from an accident for cooling the core melt that has penetrated the RPV. In order to attain rapid cooling in spite of the low heat conductivity of a predominantly oxide core melt, the melt is first to be spread quickly, and subsequently to solidify due to water access from below and, connected with it, strong evaporation processes. The present report describes various experiments planned to test this concept. (orig.)

A prototype filter combination of a HEPA and an iodine stage for low pressure drop has been tested. The results for the pressure drop and the efficiency are given. (orig.)

7809 (KFK–5327, pp. 116-123) **Thermo-hydraulic investigations on passive containment cooling.** Erbacher, F.J.; Just, W.; Neitzel, H.J.; Schmidt, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

A containment for future pressurized water reactors should ensure that the decay heat can be removed in a passive way, e.g., by natural air convection. To investigate the coolability of the composite containment by natural air convection the PASCO test facility was set up. The test facility was completed and first experiments were performed. The PASCO computer code was evaluated to compare the test results with theoretical calculations. The first experiments gave a good agreement with the calculations. It was also shown that the radiation between the channel walls is very important and the emissivity is a very sensitive quantity. (orig.)

7810 (KFK–5327, pp. 124-145) **Containment concepts and load carrying capacity.** Dolensky, B.; Goeller, B.; Krieg, R. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

For future pressurized water reactors a new containment design is under discussion, which shall be able to withstand severe accidents without significant radiological releases. One source for containment failure with large releases are missiles, as they might be created by a failure of the reactor pressure vessel under high pressure during a core melt accident. That is why appropriate protective measures against this accident scenario are under discussion today. In this paper a solution to this problem is discussed, proposing a new concept for a missile retention device. It provides

a gap of 0.5 m between reactor pressure vessel and any surrounding structure, thus allowing for the external access to the vessel as in the present plants. Additionally, the set-up forms a closed system with respect to the burst loads, so that no significant forces neither from the pressure vessel nor from the missile retention set-up itself are transmitted into the surrounding containment structures. A conservative assessment on the necessary dimensions shows that such a device is feasible with reasonable effort. (orig.)

7811 (KFK–5327, pp. 146-150) **Application of the CONTAIN code to LWRs.** Henneges, G.; Schmuck, P.; Scholtyssek, W. Kernforschungszentrum Karlsruhe GmbH (Germany). An investigation was made of the dependence of the essential thermohydraulic parameters on the containment design, the operational data of the reactor, and on materials data. (orig.)

7812 (KFK–5327, pp. 151-183) **Experimental results of the CORA test program on the LWR fuel element behavior in severe reactor accidents.** Hofmann, P.; Schanz, G.; Hagen, S.; Noack, V.; Sepold, L.; Schumacher, G. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

In the framework of the CORA program the chemical interactions among fuel element (core) materials that may occur with increasing temperature up to complete melting have been examined. The high-temperature material behavior of PWR, BWR, and VVER-1000 fuel rod bundles has been studied in large-scale integral experiments and extensive separate-effects tests. In many cases, the reaction products are liquid at temperatures above 1200 C or have lower eutectic melting points than their original components. This results in a relocation of liquefied components, often far below their original melting points. Control rod materials can separate from fuel materials by a non-coherent stage-by-stage relocation process; this may cause recriticality problems during flooding of a partially degraded core with unborated water. Similarly, molten unoxidized Zircaloy cladding can relocate away from the decladded UO_2 fuel rods. Significant relocation of UO_2 dissolved in molten unoxidized Zircaloy can begin at the Zircaloy melting temperature (1760 C), about 1000 K below the melting point of UO_2. Quenching (flooding) of the degraded bundles results in locally enhanced Zircaloy/steam reactions causing a renewed temperature rise, a meltdown of materials, and an additional strong H_2 generation. The experimental results have contributed substantially to the understanding of the high-temperature core material behavior in severe reactor accidents, and provided a unique data base for the development, improvement, and validation of material-behavior models and severe accident system codes. (orig.)

7813 (KFK–5327, pp. 184-208) **Post-test examination and evaluation of the CORA experiments. Contribution to the evaluation of the CORA-W1 test bundle.** Leistikow, S.; Schanz, G.; Metzger, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

The CORA test program concerning the LWR behavior during severe accidents is performed by HIT under international agreement and is supported by IMF with separate materials studies and contributed evaluations. The experimental program has been completed with the test CORA-W1 and CORA-W2, bundles without and with absorber material, prepared in cooperation with the Kurchatov Institute, Moscow, in order to study VVER-1000 typical core materials and fuel element configuration. Reported are here the results of post-test microstructural investigations towards the complex interdependnce of the Zr-1% Nb cladding oxidation, the temperature escalation, the melting and the chemical interaction of components, the melt relocation and blockage formation. The results of this contribution are qualitatively comparable to the behavior of western LWR type fuels under SFD-conditions. A comprehensive report concerning the test data, the materials analyses, global relocation determination and hydrogen measurement is available, detailed evaluations are being performed by the Russian side. The results will also serve as a comparison basis for the CORA-W2 test, chosen as PECD code analysis standard problem (ISP-36). (orig.)

7814 (KFK–5327, pp. 209-211) **The FPT O experiment of the Phebus project.** Goetzmann, O. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

The first of a series of six experiments of the Phebus fission product program was performed at CEN Cadarache on 2 Dec 1993. The present contribution gives a brief survey of observations and preliminary results of the test. (orig.)

7815 (KFK–5327, pp. 212-219) **Investigation of in-vessel accident sequences.** Sengpiel, W.; Homann, C.; Struwe, D. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Jun 1994. (In German). In *Safety-related LWR research. Annual report 1993.* 251p. Order Number DE95738330. Source: OSTI; NTIS (US Sales Only); INIS.

The analyses of in-vessel accident sequences of LWRs aim at answering the following questions: - What is the mass of hydrogen released during a core degradation process with and without emergency cooling, respectively; - How is the material redistribution in the core up to the eventual formation of a melt pool; which failure modes of the crust of solidified core material are possible leading to the release of melt from the pool into the lower plenum; - What is the temperature history of the RPV wall during interaction with the core melt in the lower plenum. The SCDAP/RELAP5 computer code is used on a IBM RISC 6000. In a first step towards reactor case studies, out-of-pile experiments CORA-7 and CORA-13 have been calculated with SCDAP/RELAP5/ver7AG. The comparison with experimental results shows that transient fuel rod temperatures in the upper part of the CORA bundles generally agree rather well, whereas significant differences in the axial temperature profiles are found. Moreover, the calculation of CORA-13 indicated that the complex physical process of reflood can be calculated by SCDAP/RELAP5 without numerical difficulties. In parallel, preparations for the calculation of the core behavior of the EPR (European Pressurized Water Reactor) have been started in cooperation with Siemens/KWU). (orig.)

In cooperation with NRPB (UK), the first version 1.0 of PC COSYMA for use on advanced PCs has been released; during a training course in mid 1993, future users were educated in operating the software. The main frame version of the program package COSYMA has been up-dated with new dose conversion factors and fodd-chain data and was distributed to some 20 institutes in Europe and abroad. The comparative calculations performed within the international OECD(NEA)/CEC intercomparison of accident consequence assessment codes were analysed and documented in three reports. Furtheron, consequence assessments have been performed for the research reactor BER II (two source terms) and documented; the influence on individual doses and emergency actions of inplant accident management measures in future EPRs was quantified; within th scope of a EC/US-study on the external costs of the energy cycle, accident consequences were assessed for three source terms. (orig.)

The CONTAIN code was developed by Sandia National Laboratories under the sponsorship of the US Nuclear Regulatory Commission (NRC) to provide integrated analyses of containment phenomena. It is used to predict nuclear reactor containment loads, radiological source terms, and associated physical phenomena for a range of accident conditions encompassing both design-basis and severe accidents. The code's targeted applications include support for containment-related experimental programs, light water and advanced light water reactor plant analysis, and analytical support for resolution of specific technical issues such as direct containment heating. The NRC decided that a broad technical review of the code should be performed by technical experts to determine its overall technical adequacy. For this purpose, a six-member CONTAIN Peer Review Committee was organized and a peer review as conducted. While the review was in progress, the NRC issued a draft "Revised Severe Accident Code Strategy" that incorporated revised design objectives and targeted applications for the CONTAIN code. The committee continued its effort to develop findings relative to the original NRC statement of design objectives and targeted applications. However, the revised CONTAIN design objectives and targeted applications. However, the revised CONTAIN design objectives and targeted applications were considered by the Committee in assigning priorities to the Committee's recommendations. The Committee determined some improvements are warranted and provided recommendations in five code-related areas: (1) documentation, (2) user guidance, (3) modeling capability, (4) code assessment, and (5) technical assessment.

7818 (NKS–94-7-REV) **Nordic nuclear safety research. Project plans for the 1994 - 1997 program.** Nordisk Kernesikkerhedsforskning, Roskilde (Denmark). Oct 1994. [209p.] (In Danish, Norwegian, English, Swedish). Order Number DE95616226. Source: OSTI; NTIS; INIS.

A new four-year Nordic nuclear research programme starts in 1994 as a follow-up of four previous programmes since 1977. The five Nordic countries have similar interests in maintaining competence in reactor safety and waste management, and are exposed to the same outside threats from reactors in neighbouring countries, nuclear powered vessels, and ensuing risk of contamination of terrestrial and aquatic areas. Joint Nordic project work appears an efficient means of promoting a unified view on safety issues, for regulatory authorities. It should also increase possibilities for individual countries to join the programmes of the European Union in fields related to nuclear safety. The programme is made up by seven projects, supplemented by coordination function. There are two projects in reactor safety, the first one on all the essential aspects that need to be taken into account in order to ascertain safety (project RAK-1), and the other one dealing with tools that are needed when examining the question of severe accidents (project RAK-2). In the field of waste management, methods are investigated (in project AFA-1) that permit to deal with low- and intermediate level waste containing long lived radionuclides. Consequences of radioactive contamination are dealt with in two radioecology projects: the role played by sediments, assuming contamination of the sea around the Nordic countries (project EKO-1), and the different time constants involved in the reduction of contamination in case of fall-out over various parts of the Nordic countries (project EKO-2). Two projects are in the area of emergency preparedness. One deals with measuring techniques that should yield the same results regardless of where and by which method they are performed (project EKO-3), the other involves testing whether corresponding professional knowledge exists in specific fields that are essential in the handling of an emergency situation (project EKO-4). (EG).

7819 (NUREG–1435-Suppl.4) **Status of safety issues at licensed power plants: TMI Action Plan requirements, unresolved safety issues, generic safety issues, other multiplant action issues. Supplement 4.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Dec 1994. 156p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

As part of ongoing US Nuclear Regulatory Commission (NRC) efforts to ensure the quality and accountability of safety issue information, the NRC established a program for publishing an annual report on the status of licensee implementation and NRC verification of safety issues in major NRC requirements areas. This information was initially compiled and reported in three NUREG-series volumes. Volume 1, published in March 1991, addressed the status of Three Mile Island (TMI) Action Plan Requirements. Volume 2, published in May 1991, addressed the status of unresolved safety issues (USIs). Volume 3, published in June 1991, addressed the implementation and verification status of generic safety issues (GSIs). The first annual supplement, which combined these volumes into a single report and presented updated information as of September 30, 1991, was published in December 1991. The second annual supplement, which provided updated information as of September 30, 1992, was published in December 1992. Supplement 2 also provided the status of licensee implementation and NRC verification of other multiplant action (MPA) issues not related to TMI Action Plan requirements, USIs, or GSIs. Supplement 3 gives status as of September 30, 1993. This annual report, Supplement 4, presents updated information as of September 30, 1994. This report gives a comprehensive description of the implementation and verification status of TMI Action Plan requirements, safety issues designated as USIs, GSIs, and other MPAs that have been resolved and involve implementation of an action or actions by licensees. This report makes the information available to other interested parties, including the public. Additionally, this report serves as a follow-on to NUREG-0933, "A Prioritization of Generic Safety Issues," which tracks safety issues until requirements are approved for imposition at licensed plants or until the NRC issues a request for action by licensees.

7820 (NUREG/CR–6134) **Uncertainty and sensitivity analysis of chronic exposure results with the MACCS reactor accident consequence model.** Helton, J.C. (Arizona State Univ., Tempe, AZ (United States)); Johnson, J.D.; Rollstin, J.A.; Shiver, A.W.; Sprung, J.L. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. Jan 1995. 90p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–93-2370). Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); GPO; INIS.

Uncertainty and sensitivity analysis techniques based on Latin hypercube sampling, partial correlation analysis and stepwise regression analysis are used in an investigation with the MACCS model of the chronic exposure pathways associated with a severe accident at a nuclear power station. The primary purpose of this study is to provide guidance on the variables to be considered in future review work to reduce the uncertainty in the important variables used in the calculation of reactor accident consequences. The effects of 75 imprecisely known input variables on the following reactor accident consequences are studied: crop growing season dose, crop long-term dose, water ingestion dose, milk growing season dose, long-term groundshine dose, long-term inhalation dose, total food pathways dose, total ingestion pathways dose, total long-term pathways dose, total latent cancer fatalities, area-dependent cost, crop disposal cost, milk disposal cost, population-dependent cost, total economic cost, condemnation area, condemnation population, crop disposal area and milk disposal area. When the predicted variables are considered collectively, the following input variables were found to be the dominant contributors to uncertainty: dry deposition velocity, transfer of cesium from animal feed to milk, transfer of cesium from animal feed to meat, ground concentration of Cs-134 at which the disposal of milk products will be initiated, transfer of Sr-90 from soil to legumes, maximum allowable ground concentration of Sr-90 for production of crops, fraction of cesium entering surface water that is consumed in drinking water, groundshine shielding factor, scale factor defining resuspension, dose reduction associated with decontamination, and ground concentration of 1-131 at which disposal of crops will be initiated due to accidents that occur during the growing season.

7821 (NUREG/CR–6135) **Uncertainty and sensitivity analysis of early exposure results with the MACCS Reactor Accident Consequence Model.** Helton, J.C. (Arizona State Univ., Tempe, AZ (United States)); Johnson, J.D.; McKay, M.D.; Shiver, A.W.; Sprung, J.L. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Regulatory Research. Jan 1995. 135p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–93-2371). Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); GPO; INIS.

Uncertainty and sensitivity analysis techniques based on Latin hypercube sampling, partial correlation analysis and stepwise regression analysis are used in an investigation with the MACCS model of the early health effects associated with a severe accident at a nuclear power station. The primary purpose of this study is to provide guidance on the variables to be considered in future review work to reduce the uncertainty in the important variables used in the calculation of reactor accident consequences. The effects of 34 imprecisely known input variables on the following reactor accident consequences are studied: number of early fatalities, number of cases of prodromal vomiting, population dose within 10 mi of the reactor, population dose within 1000 mi of the reactor, individual early fatality probability within 1 mi of the reactor, and maximum early fatality distance. When the predicted variables are considered collectively, the following input variables were found to be the dominant contributors to uncertainty: scaling factor for horizontal dispersion, dry deposition velocity, inhalation protection factor for nonevacuees, groundshine shielding factor for nonevacuees, early fatality hazard function alpha value for bone marrow exposure, and scaling factor for vertical dispersion.

7822 **Apparatus for unloading pressurized fluid.** Rehberger, K.M. 1992. Filed date 28 Oct 1992. U.S. Patent Application 7-967,482. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006135. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of an apparatus for unloading fluid, preferably pressurized gas, from containers in a controlled manner that protects the immediate area from exposure to the container contents. The device consists of an unloading housing, which is enclosed within at least one protective structure, for receiving the dispensed contents of the steel container, and a laser light source, located external to the protective structure, for opening the steel container instantaneously. The neck or stem of the fluid container is placed within the sealed interior environment of the unloading housing. The laser light passes through both the protective structure and the unloading housing to instantaneously pierce a small hole within the stem of the container. Both the protective structure and the unloading housing are specially designed to allow laser light passage without compromising the light's energy level. Also, the unloading housing allows controlled flow of the gas once it has been dispensed from the container. The external light source permits remote operation of the unloading device.

7823 (SAND–94-2709C) **Human event observations in the individual plant examinations.** Forester, J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 20p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410216–1: 22. transactions of the water reactor safety information meeting, Bethesda, MD (United States), 24-26 Oct 1994). Order Number DE95004542. Source: OSTI; NTIS; INIS; GPO Dep.

A major objective of the Nuclear Regulatory Commission's (NRC) Individual Plant Examination (IPE) Insights Program is to identify the important determinants of core damage frequency (CDF) for the different reactor and containment types and plant designs as indicated in the IPEs. The human reliability analysis (HRA) is a critical component of the probabilistic risk assessments (PRAS) which were done for the IPES. The determination and selection of human actions for incorporation into the event and fault tree models and the quantification of their failure probabilities can have an important impact on the resulting estimates of CDF and risk. Therefore, two important goals of the NRCs IPE Insights Program are (1) to determine the extent to which human actions and their corresponding failure probabilities influenced the results of the IPEs and (2) to identify which factors played significant roles in determining the differences and similarities in the results of the HRA analyses across the different plants. To obtain the relevant information, the NRC's IPE database, which contains information on plant design, CDF, and containment performance obtained from the IPES, was used in conjunction with a systematic examination of the HRA analyses and results from the IPES. Regarding the extent to which the results of the HRA analyses were significant contributors to the plants' CDFs, examinations of several different measures indicated that while individual human actions could have important influences on CDF for particular initiators, the HRA results did not appear to be the most significant driver of plant risk (CDF). Another finding was that while there were relatively wide variations in the calculated human error probabilities (HEPs) for similar events across plants, there was no evidence for any systematic variation as a function of the HRA methods used in the analyses.

24 POWER TRANSMISSION AND DISTRIBUTION

2403 Power Transmission Lines and Cables

7824 (DOE/EA–0962) **Final joint environmental assessment for the construction and routine operation of a 12-kilovolt (KV) overhead powerline right-of-way, and formal authorization for a 10-inch and 8-inch fresh water pipeline right-of-way, Naval Petroleum Reserve No. 1, Kern County, California.** USDOE Naval Petroleum Reserves in California, Tupman, CA (United States). Oct 1994. 132p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95002676. Source: OSTI; NTIS; GPO Dep.

The purpose and need of the proposed action, which is the installation of an overhead powerline extension from an Naval Petroleum Reserve No. 1 (NPR-1) power source to the WKWD Station A, is to significantly reduce NPR-1's overall utility costs. While the proposed action is independently justified on its own merits and is not tied to the proposed NPR-1 Cogeneration Facility, the proposed action would enable DOE to tie the NPR-1 fresh water pumps at Station A into the existing NPR-1 electrical distribution system. With the completion of the cogeneration facility in late 1994 or early 1995, the proposed action would save additional utility costs. This report deals with the environmental impacts of the construction of the powerline and the water pipeline. In addition, information is given about property rights and attaining permission to cross the property of proposed affected owners.

7826 (ANL/ET/CP–82120) **Design of a high-temperature superconductor current lead for electric utility SMES.** Niemann, R.C. (Argonne National Lab., IL (United States)); Cha, Y.S.; Hull, J.R.; Rey, C.M.; Dixon, K.D. Argonne National Lab., IL (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941013–18: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95004604. Source: OSTI; NTIS; INIS; GPO Dep.

Current leads that rely on high-temperature superconductors (HTSs) to deliver power to devices operating at liquid helium temperature have the potential to reduce refrigeration requirements to levels significantly below those achievable with conventional leads. The design of HTS current leads suitable for use in near-term superconducting magnetic energy storage (SMES) is in progress. The SMES system has an 0.5 MWh energy capacity and a discharge power of 30 MW. Lead-design considerations include safety and reliability, electrical and thermal performance, structural integrity, manufacturability, and cost. Available details of the design, including materials, configuration, and performance predictions, are presented.

7827 (TTKK/TST–2/94) **Availability analysis of a 100 kWh superconducting magnetic energy storage.** Maekinen, H.; Mikkonen, R. Tampere Univ. of Technology (Finland). Lab. of Electricity and Magnetism. 1994. 87p. Order Number DE95737621. Source: OSTI; NTIS.

Superconducting Magnetic Energy Storage (SMES) is one of the possible and useful applications of the modern superconducting technology. It is known that some loads on electricity distribution networks are particularly sensitive to short power interruptions and voltage sags. Different ranges of SMES applications have been widely discussed for large scale units (1 MWh - 1 GWh) as well as for small and medium scale units (1 kWh - 1 MWh). The major components of a SMES system are the superconducting magnet winding, the cryogenic refrigeration system and the power conditioning system, which interfaces the coil to the utility grid and applied load. The SMES winding is cooled by a cryogenic coolant: liquid helium for LTS (low temperature superconductor) wires; gaseous helium, liquid hydrogen or liquid nitrogen for HTS (high temperature superconductor) wires. In addition the higher operating temperature of HTS materials means also higher refrigeration efficiencies, greater realibility and easier acceptance within the utility community. It has been estimated that applying HTS materials in a SMES system will reduce the capital costs some 14-26 %. In this calculation it has been assumed that the price of HTS material is equivivalent to that of LTS material. This report deals with the availability aspects of a 100 kWh SMES. A conceptual design of a reference unit has been used as a basis of the study. Therefore the lack of the detailed design leads to uncertainty in evaluating the failure data for single components. The failure rate data are mainly adopted from fusion data sources. This extrapolation is problematic but in most cases the only way to get results at all. The method used is based on the failure modes, effects and criticality analysis, FMECA. Fault trees describe the outage logic based on the functional analysis. Event trees clarify the consequences of the primary events and the criticality of these consequences are expressed as system down times.

7828 (ANL/CMT/CP–82874) **Lithiated oxides for lithium-ion batteries.** Thackeray, M.M. Argonne National Lab., IL (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941063–1: 186. meeting of the Electrochemical Society, Miami, FL (United States), 9-14 Oct 1994). Order Number DE95004645. Source: OSTI; NTIS; GPO Dep.

Rechargeable lithium batteries that can be assembled in the discharged state with lithiated metal oxide cathodes and carbon anodes are being developed to minimize the safety hazards associated with batteries that use pure metallic lithium anodes. This paper highlights the progress that has been made to develop lithiated transition metal oxide cathodes that have a layered structure, Li_xMoO_2, and those that have a spinel-type structure, $Li_xM_2O_4$, (M = Co, Ni, Mn, V). Emphasis is placed on the structural properties of insertion electrodes that control their stability during electrochemical cycling. The use of lithiated spinel oxide instead of lithiated carbon (LiC_6) as the anode is briefly discussed.

7829 (ANL/CMT/CP–83329) **Transition metal oxides for rocking-chair cells.** Thackeray, M.M. (Argonne National Lab., IL (United States). Electrochemical Technology Program); Ferg, E.; Gummow, R.J.; Kock, A. de. Argonne National Lab., IL (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941144–21: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004632. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Transition metal oxides have been evaluated extensively in the past as cathode materials for lithium cells. The major emphasis of recent research has been to develop lithium-ion or rocking-chair cells that are assembled in the discharged state with a lithiated transition metal oxide cathode and a carbon anode. Although these cells are significantly safer to use than lithium cells with metallic lithium anodes, the possibility of depositing lithium at the surface of the carbon particles at the top of charge or at high rates of charge cannot be discounted. This paper discusses some recent developments in fabricating rocking-chair cells with transition metal oxide host structures as both anode and cathode, the anode providing a relatively low voltage vs. lithium and the cathode a relatively high voltage vs. lithium. These cells avoid the reducing and oxidation of lithium during charge and discharge and, therefore, reduce the safety hazards of lithium cells. Improved safety is gained, however, at the expense of cell voltage and specific energy.

7830 (KE–93011B) **Basic study on high performance secondary battery for electric load-leveling & electric vehicle.** Yang, J.H. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Seong, J.S.; Kim, J.D.; Ahn, Y.S.; Kim, H.S.; Han, S.O.; Kim, Y.N.; Kwan, K.K. No corporate text available. Dec 1993. 166p. (In Korean). Order Number DE95744288. Source: OSTI; NTIS (US Sales Only).

Na/S battery can have the higher energy density and higher power density than that of existing high performance secondary battery. This battery is expected to use for electric load leveling and electric vehicle. Ni/MH battery was developed in advanced countries, but it is one of the advanced technologies which are preserved in their own country. In the study on Na/S battery, properties of B^-alumina electrolyte was investigated. Also the construction technologies of this test cell was established by combining tube type of B^-alumina solid electrolyte with Na-, S-electrode etc. Especially of this cell, charge/discharge performance and open circuit voltage was examined. Mi/MH battery sample were tested with SBT500 system for self-discharge rate at room temp, was measured. It was found that the electrolyte and separator can be optimized to minimize the self-discharge rate. (author). refs., figs., tabs.

7831 (LBL–36293) **Thermal modeling of the lithium/polymer battery.** Pals, C.R. (Univ. of California, Berkeley, CA (United States). Dept. of Chemical Engineering). Lawrence Berkeley Lab., CA (United States). Oct 1994. 144p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95004680. Source: OSTI; NTIS; GPO Dep.

Research in the area of advanced batteries for electric-vehicle applications has increased steadily since the 1990 zero-emission-vehicle mandate of the California Air Resources Board. Due to their design flexibility and potentially high energy and power densities, lithium/polymer batteries are an emerging technology for electric-vehicle applications. Thermal modeling of lithium/polymer batteries is particularly important because the transport properties of the system depend exponentially on temperature. Two models

have been presented for assessment of the thermal behavior of lithium/polymer batteries. The one-cell model predicts the cell potential, the concentration profiles, and the heat-generation rate during discharge. The cell-stack model predicts temperature profiles and heat transfer limitations of the battery. Due to the variation of ionic conductivity and salt diffusion coefficient with temperature, the performance of the lithium/polymer battery is greatly affected by temperature. Because of this variation, it is important to optimize the cell operating temperature and design a thermal management system for the battery. Since the thermal conductivity of the polymer electrolyte is very low, heat is not easily conducted in the direction perpendicular to cell layers. Temperature profiles in the cells are not as significant as expected because heat-generation rates in warmer areas of the cell stack are lower than heat-generation rates in cooler areas of the stack. This nonuniform heat-generation rate flattens the temperature profile. Temperature profiles as calculated by this model are not as steep as those calculated by previous models that assume a uniform heat-generation rate.

7832 **Electrochemical supercapacitors.** Rudge, A.J.; Ferraris, J.P.; Gottesfeld, S. 1992. Filed date 25 Nov 1992. U.S. Patent Application 7-981,450. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006123. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention pertains to a new class of electrochemical capacitors which provides in its charge state a positive electrode including an active material of a p-doped material and a negative electrode including an active material of an n-doped conducting polymer, where the p-doped and n-doped materials are separated by an electrolyte. In a preferred embodiment, the positive and negative electrode active materials are selected from conducting polymers consisting of polythiophene, polymers having an aryl group attached in the 3-position, polymers having aryl and alkyl groups independently attached in the 3- and 4-positions, and polymers synthesized from bridged dimers having polythiophene as the backbone. A preferred electrolyte is a tetraalykyl ammonium salt, such as tetramethylammonium trifluoromethane sulphonate (TMATFMS), that provides small ions that are mobile through the active material, is soluble in acetonitrile, and can be used in a variety of capacitor configurations.

7833 (SAND–94-2763C) **Recent advances in lithium ion technology.** Levy, S.C. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950259–1: Portable by design conference, Santa Clara, CA (United States), 15-17 Feb 1995). Order Number DE95004769. Source: OSTI; NTIS; GPO Dep.

Lithium ion technology is based on the use of lithium intercalating electrodes. Carbon is the most commonly used anode material, while the cathode materials of choice have been layered lithium metal chalcogenides ($LiMX_2$) and lithium spinel-type compounds. Electrolytes may be either organic liquids or polymers. Although the first practical use of graphite intercalation compounds as battery anodes was reported in 1981 for molten salt cells (1) and in 1983 for ambient temperature systems (2) it was not until Sony Energytech announced a new lithium ion rechargeable cell containing a lithium ion intercalating carbon anode in 1990, that interest peaked. The reason for this heightened interest is that these cells have the high energy density, high voltage and fight weight of metallic lithium systems plus a very long cycle life, but without the disadvantages of dendrite formation on charge and the safety considerations associated with metallic lithium.

Project SEED is an innovative career development program sponsored by the American Chemical Society for economically disadvantages high school students. SEED students spend ten weeks during the summer in an academic, industrial, or governmental research laboratory working under the supervision of a researcher or research assistant. The primary objective of Project SEED is to encourage participants to pursue strong academic programs in order to more fully develop their career potential and help overcome social, institutional, attitudinal, and educational obstacles which have traditionally excluded the economically disadvantaged. This summer the University of New Mexico at Los Alamos initiated a special course for Project SEED students. The weekly sessions focused on academic skills training in anticipation of post secondary programs coupled with the development of greater self confidence through academic success and effective communication.

EFP-93.

In Europe, there is a vivid debate going on about application of economic instruments for environmental regulation. Whereas the U.S. has centered its academic discussions on tradable permits, Europe has chosen the tax road so far. The use of environmental taxes has not been satisfactory in terms of environmental quality so far, but perhaps Europe may benefit from the U.S. experiences in the future. This paper will focus on air pollution and carbon dioxide, that is, the problem of global warming and energy policies. After highlighting the theoretical aspects of the tax and tradable permit approach, the practical attempt to apply a CO_2 tax in the European Union, EU, is investigated. The CO_2 tax proposal has not yet been implemented in the EU. Several countries have opposed it on grounds of competitiveness and increased production coasts. Among the EU member countries, individual CO_2 taxes are only found in Denmark and the Netherlands. Denmark will here be treated as the main case - its CO_2 policy is by far the most ambitious and comprehensive in the EU. The vision of this paper is that alternatively the EU should try to use a tradable permit system for two reasons: first, the politically-defined reduction target may be realized and second, the political attractiveness of a grandfather design. (au) (21 refs.)

7847 (SAND–94-2533) **Prosperity Game: Advanced Manufacturing Day, May 17, 1994.** Berman, M. Sandia National Labs., Albuquerque, NM (United States). Dec 1994. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95004958. Source: OSTI; NTIS; GPO Dep.

Prosperity Games are an outgrowth and adaptation of move/countermove and seminar War Games. Prosperity Games are simulations that explore complex issues in a variety of areas including economics, politics, sociology, environment, education and research. These issues can be examined from a variety of perspectives ranging from a global, macroeconomic and geopolitical viewpoint down to the details of customer/supplier/market interactions in specific industries. All Prosperity Games are unique in that both the game format and the player contributions vary from game to game. This report documents a 90-minute Prosperity Game conducted as part of Advanced Manufacturing Day on May 17, 1994. This was the fourth game conducted under the direction of the Center for National Industrial Alliances at Sandia. Although previous games lasted from one to two days, this abbreviated game produced interesting and important results. Most of the strategies proposed in previous games were reiterated here. These included policy changes in international trade, tax laws, the legal system, and the educational system. Government support of new technologies was encouraged as well as government-industry partnerships. The importance of language in international trade was an original contribution of this game. The deliberations and recommendations of these teams provide valuable insights as to the views of this diverse group of decision makers concerning policy changes, foreign competition, and the development, delivery and commercialization of new technologies.

7848 (ANL/DIS/PP–83052) **A comparison of noxious facilities' impacts for home owners versus renters.** Clark, D.E. (Marquette Univ., Milwaukee, WI (United States). Dept. of Economics); Nieves, L.A. Argonne National Lab., IL (United States). [1995]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004641. Source: OSTI; NTIS; INIS; GPO Dep.

The siting of noxious facilities, such as hazardous waste facilities, is often vigorously opposed by local residents, and thus it is now common for local residents to be compensated for the presence of the facility. One technique that has been employed to implicitly value noxious facilities is the intercity hedonic approach, which examines the wage and land rent premia between cities that result from the presence of the facility. However, most of the focus has been on the behavior of home owners as opposed to renters. Since these two groups of residents vary on numerous dimensions such as marital status, age, sex, and personal mobility, it would not be surprising to find different marginal valuations of local site characteristics. The authors use 1980 Census data to derive separate estimates for owners and renters of the implicit value placed on eight different types of noxious facilities. They find that renters and owners differ in their response to noxious facilities, although the differences are not systematic. Furthermore, the differences between owners and renters are not primarily due to differential mobility or socio-demographic factors. Controlling those factors decreases the differences between renters' and owners' implicit valuations of noxious facilities by less than 10%. Unmeasured differences between the two groups, such as tastes, risk aversion, or commitment to the community, must account for the remaining difference in valuations. These findings suggest that policymakers should separately consider the responses of owners and renters when estimating noxious facility impacts.

7849 (ANL/ESD–26) **Methods of valuing air pollution and estimated monetary values of air pollutants in various U.S. regions.** Wang, M.Q.; Santini, D.J.; Warinner, S.A. Argonne National Lab., IL (United States). Center for Transportation Research. Dec 1994. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95006854. Source: OSTI; NTIS; GPO Dep.

Air pollutant emission values are used to determine the social costs of various technologies that cause air pollution and to estimate the benefits of emission control technologies. In this report, the authors present two methods of estimating air pollutant emission values–the damage value method and the control cost method–and review 15 recent studies in which these methods were employed to estimate emission values. The reviewed studies derived emission values for only a limited number of areas; emission value estimates are needed for other US regions. Using the emission values estimated in the reviewed studies, they establish regression relationships between emission values, air pollutant concentrations, and total population exposed, and apply the established relationships to 17 US metropolitan areas to estimate damage-based and control-cost-based emission values for reactive organic gases, nitrogen oxides, particulate matter measuring less than 10 microns, sulfur oxides, and carbon monoxide in these areas. Their estimates show significant variations in emission values across the 17 regions.

7851 (DOE/EH–231-054/1294) **Ignitable, corrosive, reactive, and incompatible wastes information brief.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Environmental Guidance. Dec 1994. 5p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005305. Source: OSTI; NTIS; GPO Dep.

Under RCRA Subtitle C, a solid waste can be deemed hazardous if, among other things, it exhibits one or more of the hazardous characteristics identified in 40 CFR 261, Subpart C. These characteristics are ignitability, corrosivity, reactivity, or toxicity. This information brief discusses issues related to the management of wastes exhibiting one or more of the three physical waste characteristics – ignitability, corrosivity, and reactivity. Generators of ignitable, corrosive and reactive wastes must take special precautions to ensure the safe handling of these wastes and to prevent any contact with other incompatible wastes or materials that could result in potentially dangerous situations. Regulatory definitions, an overview of the applicable compliance requirements, and special considerations for the safe handling of these characteristic hazardous or incompatible wastes are provided in this report.

7852 (DOE/EH–0447) **CERCLA §103 and EPCRA §304 Release Notification Requirements update.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). RCRA/CERCLA Div. Jan 1995. 32p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006150. Source: OSTI; NTIS; GPO Dep.

This guidance document updates and clarifies information provided in an earlier guidance document published by the US Environmental Protection Agency (EPA) entitled Guidance for Federal Facilities on Release Notification Requirements under CERCLA and SARA Title III (EPA 9360.7-06; November 1990). Since publication of that earlier guidance document, several significant events have occurred that affect the reporting obligations of facilities owned or operated by the Department of Energy (DOE), including the publication of Executive Order 12856–Federal Compliance with Right-to-Know Laws and Pollution Prevention Requirements–and a rejection by the US Court of Appeals of EPA's interpretation of the term release into the environment. In preparing this guidance document, the Office of Environmental Policy and Assistance, RCRA/CERCLA Division (EH-413), has documented responses to queries from DOE field elements on CERCLA and EPCRA release reporting requirements, as well as incorporating those Questions and Answers from the previous document that remain germane to DOE's reporting obligations under CERCLA and EPCRA.

7853 (DOE/EW/50625–T21) **Environmental Hazards Assessment Program. Quarterly report, October–December 1994.** Medical Univ. of South Carolina, Charleston, SC (United States). 31 Jan 1995. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-92EW50625. Order Number DE95005786. Source: OSTI; NTIS; GPO Dep.

The objectives of the Environmental Hazards Assessment Program (EHAP) are to: Develop a holistic, national basis for risk assessment, risk management, and risk communication that recognizes the direct impact of environmental hazards on the health and well-being of all; Develop a pool of talented scientists and experts in cleanup activities; Identify needs and develop programs addressing the critical shortage of well-educated, highly-skilled technical and scientific personnel to address the health oriented aspects of environmental restoration and waste management. This report describes activities and reports on progress for the second quarter (October - December 1994) of the third year of the grant. It reports progress against these grant objectives and the Program Implementation Plan.

7854 (DOE/OR/21981–T4) **Environmental monitoring report, May 10, 1993–June 1, 1994.** Tennessee Dept. of Environment and Conservation, Oak Ridge, TN (United States). DOE Oversight Div. 1 Sep 1994. 88p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91OR21981. Order Number DE95004860. Source: OSTI; NTIS; INIS; GPO Dep.

The Tennessee Department of Environment and Conservation (TDEC) DOE Oversight Division (DOE-O) monitoring effort will serve as oversight with ongoing compliance and ambient sampling by Oak Ridge Reservation (ORR), Department of Energy (DOE) and contractor staff programs. These sources provide a comprehensive database which must be reviewed and analyzed in order to streamline DOE-O sampling efforts. DOE-O monitoring is necessary to provide quality control, to ensure compliance, to ensure completeness, and to assure protection of public health and the environment. The Tennessee Oversight Agreement (TOA), includes a section on Environmental Monitoring as Attachment A. To accomplish these objectives, DOE-O will implement the following monitoring programs: surface waters; ground water; air; fish and wildlife. In addition, radiation monitoring has been conducted in all of these areas.

7855 (DOE/OR/21981–T5) **Environmental monitoring plan, July 1–December 31, 1994.** Tennessee Dept. of Environment and Conservation, Oak Ridge, TN (United States). DOE Oversight Div. 1 Jul 1994. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91OR21981. Order Number DE95004861. Source: OSTI; NTIS; INIS; GPO Dep.

The Tennessee Department of Environment and Conservation, DOE Oversight Division (TDEC/DOE-O) under the terms of the Tennessee Oversight Agreement (TOA) are providing annual reports: reporting of State's monitoring and analysis, and findings of DOE's quality and effectiveness of DOE's monitoring and surveillance. This report blends some of both of the required annual reports as described in the TOA section A.7.2.2. The Federal Facilities Agreement (FFA) integrates the Resource Conservation and Recovery Act (RCRA) and Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) for the Oak Ridge Reservation. This report presents the results of environmental monitoring in Tennessee in the following areas: surface waters; ground water; air; and fish and wildlife. In addition, radiation monitoring has been conducted in all of these areas.

7856 (DOE/PC/94227–T1) **Environmental impacts of ocean disposal of CO_2. First quarterly report, September 1–September 30, 1994.** Tester, J.W. Massachusetts Inst. of Tech., Cambridge, MA (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94227. Order Number DE95006246. Source: OSTI; NTIS; INIS; GPO Dep.

This paper is divided into five sections (corresponding to five tasks) which all must be considered in order to determine the ultimate environmental impact of ocean disposal of CO_2. The sections are: ambient physical and chemical properties of the ocean; CO_2 loadings (i.e. quantities and purities of CO_2) produced using different capture technologies; methods of CO_2 transport and injection, and their associated physical/chemical perturbations; environmental impacts for the scenarios outlined in section the previous section; and other considerations including legal issues, public perception, and monitoring requirements.

7857 (ECON–39/93) **Cost-effective environmental policy to environmental problems from the transportation sector in cities.** Senter for Oekonomisk Analyse (ECON), Oslo (Norway). Mar 1994. 81p. (In Norwegian). Order Number DE95737646. Source: OSTI; NTIS.

The report deals with the pollution load from the transport sector in cities. The pollution problems are to be complex and complicated. The approach in this project is to work out a theoretical and methodical framework in order to secure that the different measures to transport are to be compared and evaluated in a way of consistency. Different decision models are developed for systematizing the base of decision. Such types of models and methods for estimating the environment, are discussed and compared. The pollution load in cities and the effects of different measures, are described. A proposal in systematizing the decision base for practical use, is presented. The discussions are related to the theoretical works and real analyses being executed in Norway and internationally. 70 refs., 5 figs., 3 tabs.

7858 (ECON–307/94) **Joint implementation of climatic measures.** Senter for Oekonomisk Analyse (ECON), Oslo (Norway). May 1994. 62p. (In Norwegian). Order Number DE95737647. Source: OSTI; NTIS.

The report gives an overview of the debate about joint implementation (JI), and evaluates the possible role of JI under the framework convention on climate change. The potential for JI is evaluated on the basis of different examinations of the costs of reducing CO_2-emissions in some countries. Important issues such as possible participants, measuring and crediting of emission reductions, how to choose JI projects etc. are discussed. One chapter describes two pilot projects in Poland and Mexico, and the experiences from these projects are discussed. The organizing JI between the Nordic countries and between these countries and Eastern Europe is discussed. The report also give examples of possible sectors and fields for JI both in the Nordic countries and in Eastern Europe. 30 refs., 7 figs., 3 tabs.

7859 (EGD-CERCLA–002/0790) **Catalog of CERCLA applicable or relevant and appropriate requirements (ARARs) - fact sheets.** USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Environmental Guidance and Compliance. Jul 1990. 92p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005351. Source: OSTI; NTIS; GPO Dep.

Section 121(d) of the Comprehensive Environmental Response Compensation and Liability Act (CERCLA) as amended by the Superfund Amendments and Reauthorization Act of 1986 (SARA), requires attainment of federal and state applicable or relevant and appropriate requirements (ARARs). Subpart E, Section 300.400(g) "Identification of applicable or relevant and appropriate requirements" of the National Oil and Hazardous Substances Pollution Contingency Plan (NCP)(55 FR 8666, March 8, 1990) describes the process for attaining ARARs. The purpose of this catalog is to provide DOE Program Offices and Field Organizations with all of the "Quick Reference Fact Sheets" on attaining ARARS. These fact sheets provide overviews of ARARs for CERCLA cleanup actions pertinent to DOE environmental restoration activities. All of the fact sheets in this catalog were prepared by the Environmental Protection Agency's Office of Solid Waste and Emergency Response. Fact sheets 1-7 discuss land disposal restrictions (LDRs) and their applicability. LDRs may pertain to a number of CERCLA response actions at DOE facilities. Fact Sheets 8-13 are based on the CERCLA Compliance with Other Laws Manual: Parts I and II and provide an overview of many other CERCLA ARARs. Overview of ARARs-Focus on ARAR Waivers (fact sheet 11), provides a good introduction to ARARS. The last two fact sheets, 14 and 15, are periodic reports that describe additional fact sheets and clarify issues.

7860 (KAERI/RR–1284/93) **Economic analysis of nuclear power generation.** Song, Ki Dong (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Lee, Han Myeong; Lee, Man Kee; Moon, Ki Hwan; Kim, Seung Soo; Kim, Seong Ki; Lee, Yeong Ki. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 84p. (In Korean). Order Number DE95613260. Source: OSTI; NTIS; INIS.

As CO_2 emission is recognized as the one of the major causes of the global worming, international CO_2 emission regulation has been of great concern and has been discussed actively on the global level. Several means of CO_2 emission regulation have been raised and have received much attention recently. CO_2 emission regulation is expected to affect the national economy as well as the national energy policy. Since the electricity sector closely interacts with CO_2 emission, environmental regulation has the possibility of implementation in this sector. Considering the enormous role played by electricity in the national economy, it is very important to study the effect of environmental regulation on the electricity sector. The main purpose of this study is to estimate the marginal cost of CO_2 emission by analyzing the effect of CO_2 emission regulation on the electricity sector in terms of capacity and generation mix. This information can be used effectively in energy policy establishment. In addition, the effect of CO_2 emission regulation on economic viability of electricity generating type is also being studied in order to contribute to the establishment of Electric System Expansion Planning in Korea.

7861 (KEMI–8-94) **Phasing out lead and mercury.** Freij, L. (ed.). National Chemicals Inspectorate, Solna (Sweden). Jul 1994. 70p. Order Number DE95737667. Source: OSTI; NTIS.

Current work to phase out the use of lead and mercury in Sweden started as a Governmental Commission in 1989 to the National Chemicals Inspectorate and the Swedish Environmental Protection Agency. Proposals for measures to restrict the use of such substances which may have particularly harmful effect on the environment were to be submitted. The work was reported in 'risk reduction of chemicals - a government commission report' and includes thirteen harmful substances. In 1991 Parliament passed a government bill (1990/91:90); in which proposals were made to - phase out the use of lead in the long-term, primarily through voluntary measures, - ban mercury in certain products, and to phase-out 75% of mercury usage by the year 2010, i.e. a long-term goal. In May 1991, the Government commissioned the National Chemicals Inspectorate and the Swedish Environmental Protection Agency to report the results of phasing out lead and mercury. This report is the Chemicals Inspectorate's contribution. It describes, so far, the successful Swedish activities on phasing out lead and mercury. 14 tabs

7862 (NEI-SE–185) **African voices on climate change. Policy concerns and potentials.** Silveira, S. Stockholm Environment Inst. (Sweden). 1994. 50p. Order Number DE95737650. Source: OSTI; NTIS; INIS.

This publication is the result of a process of building an understanding and facilitating a dialogue on the issues related to climate change, on the implications that climate change have to Africa, and on the relevance of the United Nations Framework Convention on Climate Change for the continent. Research work was carried out over a year and twelve African countries were directly engaged in this projects, contributing with the work and expertise of their specialists. A whole process of discussions was started aiming not only at identifying questions concerning the countries directly involved but at illustrating the diversity of Africa's economies and societies, and attempting to raise common issues of interest for the whole of the continent. The objective of this publication is to provide a starting point for the discussions to take place during the African Conference on Policy Options and Responses to Climate Change, 5-8 December 1994, in Nairobi. This conference is not only the culmination of 'Climate and Africa' but, most of all, it opens a forum for discussions on climate issues among African policy makers and for building African positions in relation to the Climate Convention. The ideas expressed here are drawn from the

material produced in the Climate and Africa Project. Therefore, this publication does not necessarily represent the positions of the Stockholm Environment Institute or the African Center for Technology Studies in relation to Africa and the Climate Convention.

7863 (NREL/TP–461-6684) **Issues and methods in incorporating environmental externalities into the integrated resource planning process.** Fang, J.M.; Galen, P.S. National Renewable Energy Lab., Golden, CO (United States). Nov 1994. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94011843. Source: OSTI; NTIS; GPO Dep.

This report is a review of current practices and policies in considering environmental externalities in the integrated resource planning and performance based regulation (IRP/PBR) process. The following issues are presented and examined: What are the pros and cons of treating environmental externalities in the IRP process? How are potential future environmental regulations being treated? Are externalities being qualitatively or quantitatively considered, or monetized? Are offsets being allowed? How are externality policies being coordinated among different levels and branches of governments? Should environmental externalities be considered in dispatching a utility's existing resources? What are the procedures for addressing uncertainty in incorporating environmental externalities into IRP? How are externalities valued? What are other approaches to addressing environmental externalities. This report describes seven major approaches for addressing environmental externalities in the IRP process: qualitative treatment, weighting and ranking, cost of control, damage function, percentage adders, monetization by emission, and multiattribute trade-off analysis. The discussion includes a taxonomy of the full range of alternative methods for addressing environmental externalities, a summary of state PUC actions, the role of state laws, the debate on environmental adders, and the choice of methodologies. In addition, this report characterizes the interests of stakeholders such as the electric industry, fuel suppliers, energy consumers, governmental agencies, public interest groups, consultants, and others. It appears that the views, positions, and interests of these stakeholders are affected by their perceptions of the potential impacts on their economic interests or the viability of their position on environmental policy, by the societal perspective they take, and by the orientation of the analysts toward market competition and their respective accumulated expertise.

7864 (PNL–10415) **Stakeholder involvement report for the Cryocell® demonstration at Hanford.** Vick, J.D. (Pacific Northwest Lab., Richland, WA (United States)); Peterson, T.S.; McCabe, G.H.; Niesen, K.A.; Serie, P.J. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006370. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is evaluating frozen soil subsurface barriers as a way, to contain the spread of contamination. CRACKLE is one such technology being evaluated in terms of technical performance, operating requirements, and cost of deployment in and soils. The primary source of data for this evaluation will be a full-scale field demonstration to be conducted at an uncontaminated site at the Hanford Reservation during fiscal years 1994–1996. Experience has shown that not addressing stakeholder concerns early on in the process of technology development can lead to expending resources on remedial approaches that are ultimately not deployable. Therefore the CRACKLE project worked with stakeholders to help ensure that stakeholder issues and concerns, that if left unacknowledged could delay or block the deployment of the technology, were addressed during the technology's demonstration. The insights gained from stakeholder involvement in the CRACKLE demonstration project apply to other remediation technologies. Section IV and Appendix A of this report provide additional information about stakeholder comments. Understanding these insights will allow remedial project managers to anticipate issues of concern to stakeholders, to involve them effectively and to speed up technology development, deployment, and environmental cleanup.

7865 (PSI–94-10, pp. 11-17) **Insurable risk associated to climate change.** Weilenmann, U. (Winterthur Insurance, International Div., Winterthur (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change*. 144p. Order Number DE95743546. Source: OSTI; NTIS.

The paper deals with the following topics: lines of insurance impacted, the insurer's means of self-protection, the insurability of natural disaster risks in the future. 3 figs., 2 tabs., 3 refs.

7866 (SAND–94-3062C) **Ecological risk assessment benefits environmental management.** Fairbrother, A. (Ecological Planning and Toxicology, Inc., Corvallis, OR (United States)); Kapustka, L.A.; Williams, B.A.; Glicken, J. Sandia National Labs., Albuquerque, NM (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9411167–1: Ecological risk assessment: uses and abuses conference, Corvallis, OR (United States), 15-16 Nov 1994). Order Number DE95004554. Source: OSTI; NTIS; GPO Dep.

The ecological risk assessment process in its ideal form is an unbiased approach for assessing the probability of harm to the environment as a consequence of a given action. This information can then be combined with other societal values and biases in the management of such risks. However, as the process currently is understood, decision makers often are accused of manipulating information in order to generate decisions or achieve buy in from the public in support of a particular political agenda. A clear understanding of the nature of the risk management process can help define areas where information should be free from social or personal bias, and areas where values and judgments are critical. The authors do not propose to discuss the individual's decision-making process, but rather to address the social process of risk communication and environmentally-related decision-making, identifying which parts of that process require bias-free, scientifically generated information about the consequences of various actions and which parts need an understanding of the social values which underlie the informed choices among those possible actions.

7867 (SVF-O–97) **Evaluation of the prerequisites to adapt to the law on environmental charges on emission of nitrogen oxides in energy production at combustion plants producing 25-50 GWh/year.** Baeckstroem, S. (Vattenfall Utveckling AB, Vaellingby (Sweden)); Harnevie, H. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Dec 1994. 24p. (In Swedish). Order Number DE95737673. Source: OSTI; NTIS.

Following the Swedish government decision of June 10th 1994, NO_x fees will apply to production units with a utilised energy production of at least 25 GWh during one calendar year. This new law comes into effect in two steps with the new limit 40 GWh/year as of January 1 st 1996 and 25 GWh/year as of January 1 st 1997. As an consequence of this, a large number of small furnaces, 6-10 MW, will be facing new demands regarding measuring and reporting amount of emitted nitrogen oxides. The requirements are the same as for the plants already involved in the NO_x fee system. The economical and practical abilities of these plants to meet the requirements are presently sparsely investigated and the trades concerned reports of widespread uncertainty. With the ambition to enlighten the matter, Vaermeforsk initiated the present study in May 1994. This subsequent report presents economical consequences for different plants concerned with the new fees, a presentation of available measuring instruments together with a cost/benefit analysis of such equipment. A suggested comparative study of the costs, availability and long-time operation of this equipment during the first year of operation is presented. It is suggested that 4-5 plants will be equipped with different measuring techniques and enrolled in the project. The suggested plants are 2-3 oil/gas fired together with 2 bio fired combustion plants. The plants will be equipped with 2 electrochemical measurement systems and 2 'stripped' versions of more established techniques. As a fit measuring system could an equipment able to continuously determine the NO_x level from general running parameters (such as temperature, O_2 concentration, the condition of the combustion air) be in rolled. 12 refs, 3 tabs

7868 (NEI-DK–1763) **Estimate of resources from wastes in Denmark.** Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark); ELKRAFT A.m.b.A., Ballerup (Denmark); Slovakia Energy, Ballerup (Denmark). May 1994. 202p. (In Danish). Order Number DE95737518. Source: OSTI; NTIS.

An estimate of Danish resources of combustible municipal wastes, and their combustible values, is given in addition to a description of related current legislation. Suggestions are given as to the development of this form of fuel potential. According to the government's plan of management for re-use of wastes, 25% should be used as fuel in cogeneration plants. It is expected that the amount of wastes processed by incineration will increase by 25%, and that the volume of wastes deposited will decrease. (AB)

7869 (DOE/CR–0032) **FY 1996 Congressional budget request: Budget highlights.** Department of Energy, Washington, DC (United States). Office of the Controller. Feb 1995. 113p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007104. Source: OSTI; NTIS; GPO Dep.

The FY 1996 budget presentation is organized by the Department's major business lines. An accompanying chart displays the request for new budget authority. The report compares the budget request for FY 1996 with the appropriated FY 1995 funding levels displayed on a comparable basis. The FY 1996 budget represents the first year of a five year plan in which the Department will reduce its spending by $15.8 billion in budget authority and by $14.1 billion in outlays. FY 1996 is a transition year as the Department embarks on its multiyear effort to do more with less. The Budget Highlights are presented by business line; however, the fifth business line, Economic Productivity, which is described in the Policy Overview section, cuts across multiple organizational missions, funding levels and activities and is therefore included in the discussion of the other four business lines.

7870 (DOE/ED–0006) **Forecast of Contracting and Subcontracting Opportunities, Fiscal year 1995.** USDOE Office of Small and Disadvantaged Business Utilization, Washington, DC (United States). [1995]. 61p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006376. Source: OSTI; NTIS; GPO Dep.

Welcome to the US Department of Energy's Forecast of Contracting and Subcontracting Opportunities. This forecast, which is published pursuant to Public Low 100–656, "Business Opportunity Development Reform Act of 1988," is intended to inform small business concerns, including those owned and controlled by socially and economically disadvantaged individuals, and women-owned small business concerns, of the anticipated fiscal year 1995 contracting and subcontracting opportunities with the Department of Energy and its management and operating contractors and environmental restoration and waste management contractors. This document will provide the small business contractor with advance notice of the Department's procurement plans as they pertain to small, small disadvantaged and women-owned small business concerns.Opportunities contained in the forecast support the mission of the Department, to serve as advocate for the notion's energy production, regulation, demonstration, conservation, reserve maintenance, nuclear weapons and defense research, development and testing, when it is a national priority. The Department's responsibilities include long-term, high-risk research and development of energy technology, the marketing of Federal power, and maintenance of a central energy data collection and analysis program. A key mission for the Department is to identify and reduce risks, as well as manage waste at more than 100 sites in 34 states and territories, where nuclear energy or weapons research and production resulted in radioactive, hazardous, and mixed waste contamination. Each fiscal year, the Department establishes contracting goals to increase contracts to small business concerns and meet our mission objectives.

7871 (DOE/ER–0635) **Summaries of FY 1994 engineering research.** USDOE Office of Energy Research, Washington, DC (United States). Office of Basic Energy Sciences. Dec 1994. 71p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005656. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the Basic Energy Sciences Engineering Research Program for fiscal year 1994; it provides a summary of each of the program projects in addition to a brief program overview. The report is intended to provide staff of Congressional committees, other executive departments, and other DOE offices with substantive program information so as to facilitate governmental overview and coordination of Federal research programs. Of equal importance, its availability facilitates communication of program information to interested research engineers and scientists.

7872 (DOE/S–0069-Vol.1) **Transition report, United States Department of Energy: A report to the President-Elect. Volume 1.** USDOE, Washington, DC (United States). Nov 1988. 351p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004882. Source: OSTI; NTIS; GPO Dep.

This report is a description of the Department of Energy organization and projects. The topics of the report include: (1) DOE organization and overview; (2) Headquarters Offices: Congressional, Intergovernmental and Public Affairs; Conservation and Renewable Energy; Contract Appeals; Defense Programs; Economic Regulatory Administration; Energy Information Administration; Energy Research; Environment, Safety and Health; Fossil Energy; General Counsel; Hearings and Appeals; Inspector General; International Affairs and Energy Emergencies; Management and Administration; Minority Economic Impact; New Production Reactors; Nuclear Energy; Policy, Planning and Analysis; Radioactive Waste Management; (3) Operations Offices: Albuquerque Operations Office; Chicago Operations Office; Idaho Operations Office; Nevada Operations Office; Oak Ridge Operations Office; Richland Operations Office; San Francisco Operations Office; Savannah River Operations Office; Laboratories; and (4) Power Administrations: Bonneville Power Administration; Western Area Power Administration.

7873 (DOE/S–0069-Vol.2) **Transition report, United States Department of Energy: A report to the President-Elect. Volume 2.** USDOE, Washington, DC (United States). Nov 1988. 225p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004883. Source: OSTI; NTIS; GPO Dep.

This report is a description of the Department of Energy transition issues. The topics of the report include: Congressional, Intergovernmental and Public Affairs; Conservation and Renewable Energy; Defense Programs; New Production Reactors; Economic Regulatory Administration; Energy Information Administration; energy research; environment, safety and health; fossil energy; General Counsel; hearings and appeals, Inspector General, international affairs and energy emergencies; management and administration, minority economic impact; nuclear energy; policy, planning and analysis, radioactive waste management; and power marketing administrations: Bonneville Power Administration, Western Area Power Administration, Alaska Power Administration, Southeastern Power Administration, and Southwestern Power Administration.

7874 (DOE/TP–0001) **Technology transfer 1995.** USDOE, Washington, DC (United States). Jan 1995. 167p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95004241. Source: OSTI; NTIS; GPO; GPO Dep.

Single copies are available free from OSTI. Multiple copies, contact OSTI for charge.

Technology Transfer 1995 is intended to inform the US industrial and academic sectors about the many opportunities they have to form partnerships with the US Department of Energy (DOE) for the mutual advantage of the individual institutions, DOE, and the nation as a whole. It also describes some of the growing number of remarkable achievements resulting from such partnerships. These partnership success stories offer ample evidence that Americans are learning how to work together to secure major benefits for the

nation–by combining the technological, scientific, and human resources resident in national laboratories with those in industry and academia. The benefits include more and better jobs for Americans, improved productivity and global competitiveness for technology-based industries, and a more efficient government laboratory system.

7875 (NREL/SP–336-7233) **National Renewable Energy Laboratory information resources catalogue. A collection of energy efficiency and renewable energy information resources.** National Renewable Energy Lab., Golden, CO (United States). 1994. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94011900. Source: OSTI; NTIS; GPO Dep.

NREL's first annual Information Resources Catalogue is intended to inform anyone interested in energy efficiency and renewable energy technologies of NREL's outreach activities, including publications and services. For ease of use, all entries are categorized by subject. The catalogue is separated into six main sections. The first section lists and describes services that are available through NREL and how they may be assessed. The second section contains a list of documents that are published by NREL on a regular or periodic basis. The third section highlights NREL's series publications written for specific audiences and presenting a wide range of subjects. NREL's General Interest Publications constitute the fourth section of the catalogue and are written for nontechnical audiences. Descriptions are provided for these publications. The fifth section contains Technical Reports that detail research and development projects. The section on Conference Papers/Journal Articles/Book Chapters makes up the sixth and final section of the catalogue.

7876 (ORNL/PPA–94/4) **Oak Ridge National Laboratory Core Competencies.** Roberto, J.B. (and others); Anderson, T.D.; Berven, B.A.; Hildebrand, S.G.; Hartman, F.C.; Honea, R.B.; Jones, J.E. Jr.; Moon, R.M. Jr.; Saltmarsh, M.J.; Shelton, R.B. Oak Ridge National Lab., TN (United States). Dec 1994. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004833. Source: OSTI; NTIS; GPO Dep.

A core competency is a distinguishing integration of capabilities which enables an organization to deliver mission results. Core competencies represent the collective learning of an organization and provide the capacity to perform present and future missions. Core competencies are distinguishing characteristics which offer comparative advantage and are difficult to reproduce. They exhibit customer focus, mission relevance, and vertical integration from research through applications. They are demonstrable by metrics such as level of investment, uniqueness of facilities and expertise, and national impact. The Oak Ridge National Laboratory (ORNL) has identified four core competencies which satisfy the above criteria. Each core competency represents an annual investment of at least $100M and is characterized by an integration of Laboratory technical foundations in physical, chemical, and materials sciences; biological, environmental, and social sciences; engineering sciences; and computational sciences and informatics. The ability to integrate broad technical foundations to develop and sustain core competencies in support of national R&D goals is a distinguishing strength of the national laboratories. The ORNL core competencies are: 9 Energy Production and End-Use Technologies o Biological and Environmental Sciences and Technology o Advanced Materials Synthesis, Processing, and Characterization & Neutron-Based Science and Technology. The distinguishing characteristics of each ORNL core competency are described. In addition, written material is provided for two emerging competencies: Manufacturing Technologies and Computational Science and Advanced Computing. Distinguishing institutional competencies in the Development and Operation of National Research Facilities, R&D Integration and Partnerships, Technology Transfer, and Science Education are also described. Finally, financial data for the ORNL core competencies are summarized in the appendices.

7877 (PNL–9410-4) **The AMTEX Partnership™. Fourth quarter report, September 1994.** Lemon, D.K.; Quisenberry, R.K. Pacific Northwest Lab., Richland, WA (United States). Jun 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95005717. Source: OSTI; NTIS; GPO Dep.

The AMTEX Partnership™ is a collaborative research and development program among the US Integrated Textile Industry, the Department of Energy (DOE), the DOE laboratories, other federal agencies and laboratories, and universities. The goal of AMTEX is to strengthen the competitiveness of this vital industry, thereby preserving and creating US jobs. The operational and program management of the AMTEX Partnership is provided by the Program Office. This report is produced by the Program Office on a quarterly basis and provides information on the progress, operations, and project management of the partnership.

7878 (PNL–10258) **Staff exchange with Spokane Intercollegiate Research and Technology Institute (SIRTI), final project report.** Alexander, G.M. Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95004948. Source: OSTI; NTIS; GPO Dep.

Staff exchanges, such as the one described in this report, are intended to facilitate communication and collaboration among scientists and engineers at Department of Energy (DOE) laboratories, in U.S. industry, and academia. Funding support for these exchanges is provided by the DOE, Office of Energy Research, Laboratory Technology Transfer Program. Funding levels for each exchange typically range from $20,000 to $40,000. The exchanges offer the opportunity for the laboratories to transfer technology and expertise to industry, gain a perspective on industry's problems, and develop the basis for further cooperative efforts through Cooperative Research and Development Agreements (CRADAS) or other mechanisms.

7879 (RISO-R–785(DA)) **Three-year plan (1995-1997) for the activities of Risoe National Laboratory.** Risoe National Lab., Roskilde (Denmark). Jan 1995. 44p. (In Danish). Order Number DE95737570. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

This three-year plan describes the activities of Risoe National Laboratory in the period 1995-1997. Risoe National Laboratory belongs under the Danish Ministry of Research and concentrates on strategic research within energy, environment and materials. (au)

7880 (SAND–94-2257) **Physical and Chemical Sciences Center: Research briefs. Volume 9-94.** Vook, F.L.; Samara, G.A. (eds.). Sandia National Labs., Albuquerque, NM (United States). 1994. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95005443. Source: OSTI; NTIS; GPO Dep.

As Sandia National Laboratories and the Physical and Chemical Sciences Center develop an increasingly diverse set of customers, research partners, and Cooperative Research and Development Agreements (CRADA's) with industry, there is a need for providing more concise information describing the technical achievements and capabilities. This publication, Research Briefs, is designed to inform the present and potential partners in research and technology advancement. The research emphasizes semiconductor physics, electronic materials, surface physics and chemistry, plasma and chemical processing sciences, lasers and optics, vision science, ion-solid interactions and defect physics, and advanced materials physics. The specific programs pursued are driven by the research goals which are greatly influenced by interactions with the government and industrial customers.

7881 (SEAB–95006873) **Alternative futures for the Department of Energy National Laboratories.** Secretary of Energy Advisory Board, Washington, DC (United States). Feb 1995. 78p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006873. Source: OSTI; NTIS; GPO Dep.

This Task Force was asked to propose alternate futures for the Department of Energy laboratories noted in the report. The authors' intensive ten months' study revealed multiple missions and submissions–traditional missions and new missions–programs and projects–each with factors of merit. They respectively suggest that the essence of what the Department, and particularly the laboratories, should and do stand for: the energy agenda. Under the overarching energy agenda–the labs serving the energy

opportunities–they comment on their national security role, the all important energy role, all related environmental roles, the science and engineering underpinning for all the above, a focused economic role, and conclude with governance/organization change recommendations.

Statni Urad pro Jadernou Bezpecnost, Prague (Czech Republic). 1994. 187p. (In Czech). Order Number DE95613296. Source: OSTI; NTIS (US Sales Only); INIS.

English translation available from Nuclear Information Center, 156 16 Prague-Zbraslav, Czech Republic, at USD 10.- per typewritten page.

Reproduced are full texts or parts of selected acts, regulations, decrees and other applicable Czech legal documents dealing with state surveillance over nuclear safety of nuclear facilities and of the environment, construction of nuclear facilities, non-proliferation of nuclear weapons, accountancy of and control over nuclear materials, nuclear safety, radioactive wastes, and ways to ensure safety and security in nuclear power and related industrial sectors. (J.B.).

7883 (KAERI/RR–1204/92) **Analysis of the trend in international nuclear affairs -With reference to nuclear policy development in the UK-.** Kim, Hwa Sup: Yang, Maeng Ho (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Ham, Chul Hoon; Kim, Hyun Jun; Cho, Suk Hong; Lee, Dong Jin; Kim, Ji Whan; Kim, Jong Sook; Yun, Yung Woo. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1992. 148p. (In Korean). Order Number DE95613277. Source: OSTI; NTIS; INIS.

The objective of this study is to identify the role of nuclear energy in UK's energy policies to analyse her nuclear policies, and to extract implications in setting up the Korean nuclear policy. this study briefly reviews the status of social system, energy resources/demand/supply, and nuclear energy uses in the UK. The history of nuclear development policy in the UK is also summarized. Furthermore, this study looks into the present and future nuclear policy of the country, describing progress of the power industry, development of FBR, radwaste management, nuclear damage compensation system, and so on in detail. Finally, some characteristics of the UK's nuclear policy including review of the cooperation agreement for nuclear energy between Korea and the UK are identified, and some implications from these are also suggested as conclusions. (Author).

7884 (SLU-REK-R–74) **Interview-survey of farmers. Experiences after the Chernobyl accident.** Karlen, G. Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Radioecology. 1994. 13p. (In Swedish). Order Number DE95616129. Source: OSTI; NTIS; INIS.

71 farm households in contaminated areas of Sweden were interviewed at visits to farms, where measurements of the contamination of pastures and fields had been made. The aim of the survey was to find out what remedial actions had been taken by the farmers, what their appreciation of the information from authorities was, how the Chernobyl accident had affected their situation, and if they were prepared to take similar actions in case of a new accident. 15 refs.

7885 (DOE/EIA–0538(94/95-15)) **Winter fuels report. Week ending: January 20, 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. Jan 1995. 87p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005670. Source: OSTI; NTIS; GPO Dep.

The Winter Fuels Report is intended to provide concise, timely information to the industry, the press, policymakers, consumers, analysts, and State and local governments on the following topics: distillate fuel oil net production, imports and stocks on a U.S. level and for all Petroleum Administration for Defense Districts (PADD) and product supplied on a US level; propane net production, imports and stocks on a US level and for PADD's 1, 2, and 3; natural gas supply and disposition and underground storage for the US and consumption for all PADD's; as well as selected National average prices. Residential and wholesale pricing data for heating oil and propane for those States participating in the joint Energy Information Administration (EIA)/State Heating Oil and Propane Program; crude oil and petroleum price comparisons for the US and selected cities; and a 6–10 Day, 30-Day, and 90-Day outlook for temperature and precipitation and US total heating degree-days by city.

7886 (DOE/EIA–M069/A) **Appendix model performance - model documentation renewable fuels module of the National Energy Modeling System.** USDOE Energy Information Administration, Washington, DC (United States). Office of Integrated Analysis and Forecasting. Sep 1994. 12p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006080. Source: OSTI; NTIS; GPO Dep.

This appendix discusses performance aspects of the Renewable Fuels Module (RFM). It is intended to present the pattern of response of the RFM to typical changes in its major inputs from other NEMS modules. The overall approach of this document, with the particular statistics presented, is designed to be comparable with similar analyses conducted for all of the modules of NEMS. While not always applicable, the overall approach has been to produce analyses and statistics that are as comparable as possible with model developer's reports for other NEMS modules. Those areas where the analysis is somewhat limited or constrained are discussed. Because the RFM consists of independent submodules, this appendix is broken down by submodule.

7887 (FOA-R–94-00022-1.2) **Use of Power? EPIK - Energy Problems in Wartime.** Frost, C.; Molin, S. National Defence Research Establishment, Stockholm (Sweden). Dept. of Defence Analysis. Oct 1994. 48p. (In Swedish). Order Number DE95737684. Source: OSTI; NTIS.

The EPIK project - Energy problems in Wartime - treats the problem of electricity demand during a swift and sudden military attack against the Stockholm area. The study focuses on those activities which are necessary to support the total national defence system and secure the survival of the population. In this context, certain activities and societal functions have very high priority. These include: civil command structures; information, communication and alarm functions; mobilization; the police and defence forces; civil defence and shelter; provision of water, food, medicine and certain industrial goods; emergency hospital treatment and nursing. In order to secure such activities, a number of physical systems - in this case particular objects - must function. The amount of electrical power required for these objects as well as for housing and less important high-consumption customers, is compared to the local electrical production capacity. From this comparison we can deduce if it is possible for defence planning to achieve its goals. The possibility of supplying these objects with electric power is discussed, as well as possible ways to minimize unnecessary consumption. We discuss mainly total electricity demand, production and distribution on a local level, different control mechanisms and power reserves. We discuss two possibilities for subsistence for the population - -food and heating at home vs. collective meals in public places such as schools - and show how electrical power consumption differs in these two cases. 8 refs, 5 figs

7888 (CONF-8810273–) **US–Japan energy policy consultations.** Atlantic Council of the United States, Washington, DC (United States). 1989. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-88IE10688. From US-Japan energy policy consultations meeting; Mauna Kea, HI (United States); 16-18 Oct 1988. Order Number DE89003853. Source: OSTI; NTIS; INIS.

These papers, from the US–Japan Energy Policy Consultations Meeting in Hawaii, deal with topics relating to: energy outlook; electric utilities; nuclear energy; coal and petroleum based energies; and new energy source development. (JF)

7889 (NEI-DK–1766) **Energy saving consultancy and training in Latvia. Final report for phases C1, D and E1 with an update for phases A and B.** Birch og Krogboe A/S, Virum (Denmark). Nov 1994. 29p. Contract IMOe-427. Order Number DE95737524. Source: OSTI; NTIS.

In cooperation with: Latvian Energy Agency; Ministry of Education, Riga; Ministry of the Environment and Regional Affairs, Riga; Riga Technical University; Firma NAMS Ltd., Riga (Latvia); State Building Research Institute; Danfoss A/S; Villadsen Tagentreprise A/S; Grundofs A/S; Monies og Andersen A/S; DAFA A/S; Ravn Vinduer og Doere A/S (Denmark).

A full summary of the conclusion and recommendations for phases A (Information Campaign on Energy Savings) and B (Building Audits) may be found in the Final Report for Phases A and B published in December 1992. However, a brief up-date may be appropriate. With regard to energy saving information activities (Phase A) it should be noted that the brochure on energy savings produced during the project is still being distributed (by the OPET Office in Riga) in Latvia. Birch and Krogboe together with Danish advertising agency Information group has won an international competition for the EBRD funded project 'Latvia: Energy Awareness Conservation Campaign'. The start of the project has been delayed, but it is expected to start soon with a deadline set for October 1994. This project can be seen as a continuation on a larger scale of the activities started in the fall of 1992 within the framework of the present project. It is not known to us to what extent the building audit reports (Phase B) have been used or are being used for instructional or other purposes. The recommendations of one of the audits, Secondary School No. 3 in Riga, is being implemented at the moment (Phase C1). Work on revision of the Latvian Building Code (phase D9) began in February 1994, with six months delay. The work was carried out by Birch and Krogboe staff together with a private Latvian consultant from NAMS Ltd. The concept behind the project, that is a gradual process of audits, information, lectures, seminars, consultancy and demonstration projects aiming at transfer of know-how was destroyed because funding was made available only in installments with irregular intervals over a period of more than two years. Despite all the delays, unexpected problems and difficulties it is our conclusion that much valuable and long lasting work has been accomplished. (EG)

7890 (PSI–94-10) **Steps towards a decision making framework to address climate change.** Pillet, G. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)); Gassmann, F. (eds.). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. 144p. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). Order Number DE95743546. Source: OSTI; NTIS.

This report from the Montreux IPCC III writing team II meeting assembles papers that evolved from that meeting. They are organised around three main entries, as follows: - appreciation of climate change prospects and consequences, - constituents and variations to existing economic decision making frameworks, - integrated views or layouts showing candidate frameworks to address climate change under uncertainty and risk. (author) figs., tabs., refs.

7891 (PSI–94-10, pp. 3-9) **"Abrupt change" scenarios. Global scenarios revisited with respect to emerging scientific insights.** Gassmann, F. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change.* 144p. Order Number DE95743546. Source: OSTI; NTIS.

The anthropogenic nature of CO_2-increase found wide acceptance in the scientific world and caused public concern. However, this acceptance does not yet mean an acceptance of anthropogenic climate change. In this paper, two "abrupt change" scenarios are proposed in addition to the "classical" scenario characterised by gradual warming. (author) 2 figs., tabs., 8 refs.

7892 (PSI–94-10, pp. 19-29) **Global warming damage and the risk of a climate catastrophe.** Fankhauser, S. (University Coll., London (United Kingdom)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change.* 144p. Order Number DE95743546. Source: OSTI; NTIS.

This paper illustrates the economic costs and consequences of a climate catastrophe. While some information exist about the impacts of extreme weather events, the question of high impact and (presumably) low probability events is also rather speculative. In the paper we will provide some illustrative figures for both aspects. (author) 2 figs., 1 tab., 19 refs.

7893 (PSI–94-10, pp. 33-40) **Climate change and discount rates.** Schubert, R. (Eidgenoessische Technische Hochschule, Zurich (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change.* 144p. Order Number DE95743546. Source: OSTI; NTIS.

When evaluating actions which directly or indirectly produce climate change effects, it seems reasonable to use a positive, yet small discount rate. This result is based on a weighing up different arguments in favor of $r>0$ or $r=0$ as well as of arguments for a high or a low discount rate respectively. Because of the high sensitivity of present values of costs and benefits with respect to the discount rate's value, the determination of this rate should be undertaken quite carefully. Empirical investigations might be helpful as well as for determining effectively used rates as well as for their adaptation to desired levels. (author) 23 refs.

7894 (PSI–94-10, pp. 41-49) **On the opportunity cost of climate change and policy.** Hediger, W. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change.* 144p. Order Number DE95743546. Source: OSTI; NTIS.

The opportunity cost of climate change cannot be evaluated without an explicit formulation of policy targets, and without value judgements. However, if a clear statement about the scope, in time and space, is internationally agreed, the concept of opportunity cost can provide a helpful tool to enable rational choice, and finally achieve a transition towards sustainable development. (author) 24 refs.

7895 (PSI–94-10, pp. 51-65) **Decision-making under environmental uncertainty.** Faucheux, S. (Paris Univ., Pantheon-Sorbonne, Paris (France)); Froger, G. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change.* 144p. Order Number DE95743546. Source: OSTI; NTIS.

The paper's main concern is with different decision-making models for environmental issues and with the hypotheses of rationality underlying such models. The thesis supported here is that the most environmental problems such as the increase of the greenhouse effect, the hole of the ozone layer or the loss of biodiversity, are situated in a context being at the same time of uncertainty, of irreversibility and of complexity. We shall explain why stressing the role of these elements implies a reversal of the traditional attitude towards decision-making. This presupposes a paradigm of economic rationality much broader than that of orthodox economics, called procedural rationality. Our paper is in two parts. The first part concerns the limits of the stochastic environmental approaches based on the Bayesian decision theory and on a substantive rationality hypothesis. Such approaches cannot take into consideration the environmental uncertainty and its implications, especially the

irreversibility. The second part concerns the decision-making analyses based upon the hypothesis of bounded and/or procedural rationality, as well as their ability to take account of the interactions between uncertainty, irreversibility and complexity. (author) 1 tab., refs.

7896 (PSI–94-10, pp. 67-74) **Environmental problems and attitudes towards risk and uncertainty.** Beltratti, A. (Torino Univ., Istituto Prato, Torino (Italy)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change.* 144p. Order Number DE95743546. Source: OSTI; NTIS.

The paper considers different models of decision-making under risk and uncertainty, pointing out that ignorance about future consequences (that is the presence of uncertainty in the sense of Knight) is by itself not a justification for postponement of action conductive to insurance. In fact models of non-linear probabilities or maximin expected utility suggest that a situation where the range of the unknown is large, as in the climate change issue, should induce, ceteris paribus, a large reaction in terms of precautionary defensive expenditures. (author) 12 refs.

7897 (PSI–94-10, pp. 77-97) **Decision making framework to address climate change.** Parikh, J. (Indira Gandhi Inst. of Development Research, Bombay (India)); Babu, P.G.; Parikh, K. Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change.* 144p. Order Number DE95743546. Source: OSTI; NTIS.

The threat of global warming and consequent climate change due to accumulation of greenhouse gases in the atmosphere poses a number of challenges. Policy decisions to address climate change have to be in a complex setting that involves issues of ethics, equity and uncertainty. We need to formulate response strategies to answer some important questions in the global warming context. The purpose of this paper is to explore how should one answer these questions. In other words, what should be our decision making framework for the immediate actions needed and for the long term horizon? (author) 2 figs., refs.

7898 (PSI–94-10, pp. 99-109) **Global environmental risks and financial instruments.** Chichilnisky, G. (Stanford Univ., Dep. of Economics, Stanford (United States)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change.* 144p. Order Number DE95743546. Source: OSTI; NTIS.

Does the existence of uncertainty about the timing and magnitude of climate change imply that there is no need for action now, and that decisions can be postponed until some of the uncertainties are resolved? This paper sets out a framework for thinking about this issue, and argues that action to curb the risk of climate change can be viewed and justified as an insurance policy: it is often prudent to insure against potentially harmful events even if there is considerable uncertainty about whether they will occur. The paper discusses a range of financial instruments which can be used to hedge against environmental risks, including mutual insurance contracts, and securities such as CAT Futures. It also discusses the North-South aspects of global environmental risks: most of the carbon emitted originates in the industrial countries, while the most harmful effects are generally predicted to fall disproportionately on the poorest regions on the earth. (author) 7 refs.

7899 (PSI–94-10, pp. 111-114) **Portfolio analysis model of climate change decision making.** Haites, E.F. (Barakat and Chamberlin, Toronto (Canada)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change.* 144p. Order Number DE95743546. Source: OSTI; NTIS.

Climate change policy decisions can be compared to investment portfolio decisions. Numerous policy measures are available to limit the impacts of climate change. Countries will typically implement several of these policy measure since no one measure is clearly superior. The decision then is to choose the portfolio of policy measures best suited to the country's circumstances and to adjust the portfolio over time in response to new developments. (author)

7900 (PSI–94-10, pp. 115-137) **Betting on climate states. The impact of climate change prospects on decision making under "strong" uncertainty and collective risks.** Pillet, G. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. (CONF-9403197–: IPCC WG 3 writing team 2 meeting, Montreux (Switzerland), 3-6 Mar 1994). In *Steps towards a decision making framework to address climate change.* 144p. Order Number DE95743546. Source: OSTI; NTIS.

Climate change prospects have an impact on uncertainty and risk, as we ordinarily understand these expressions. In this paper, I check this by clarifying the distinction between risk and uncertainty with respect to global environmental problems, and consider the implications in relation to the decision making process. Lack of data and knowledge, less dependable probability distributions, gaps between competence and difficulty (agents are not able to figure out all of the complexities of a nature-economy system), small contributions of information from a number of diverse sources, and the global dimension of environmental risks make uncertainty stronger and risk collective. This phenomenon and attached consequences are called the uncertainty effect. I describe this effect with the help of a simplified two period world model with a depletable stock of natural resource and unknown utility from the second period. Consequences are similar to the ones from a discounted utilitarian perspective: Consumption today dominates the equation whereas distant in time utility, being strongly uncertain, is heavily discounted. Yet, in as far a strong uncertainty characterises long-run environmental problems with costs up front and benefits far into the future, a specific decision making framework must be explored if one wants to address an ecological-economic perspective. Surprisingly, this does not establish that, ceteris paribus, international conventions and attached conventional strategies are the only means at hand as guides to decision making under these conditions. It turns out that there is room for an alternative market framework to be implemented in relation to Arrow securities and inter-regional markets for climate positions. This market framework is apt at solving the ecological-economic long run equation by hedging against unexpected climate change associated "strong" uncertainties and collective risks. (author) 7 figs., 1 tab., refs.

Institut Francais du Petrole (IFP), 92 - Rueil-Malmaison (France); Poitiers Univ., 86 (France). Jun 1994. 344p. (In French). Order Number DE95612595. Source: OSTI; NTIS (US Sales Only); INIS.

The decomposition of model molecules reacting alone or in competition was studied in a fixed bed reactor at 623 K and 7 MPa over a sulfided $NiMo/Al_2O_3$ catalyst. The inhibiting effect of H_2S and some nitrogen molecules, namely quinoline type compounds plays a major role in the transformation of anilines intermediates. On the other hand H_2S acts as a cocatalyst and promote carbon-nitrogen bond cleavage, specially at low H_2S partial pressure. When the H_2S partial pressure is greater than the nitrogen compound partial pressure an inhibiting effect of H_2S occurs and its promoting effect on carbon-nitrogen bond cleavage is cancelled. Hydrogen has a positive but moderate effect in hydrogenation steps. The mechanism of carbon-nitrogen bond scission depends

on the structure of the nitrogen molecule namely on the hybridization of the carbon atom bearing the nitrogen atom. If the carbon a with respect to the nitrogen is monosubstituted the mechanism is essentially a nucleophilic substitution. When the degree of substitution increases the elimination mechanism becomes more important and the two mechanisms are in competition. With a sulfided catalyst, H_2S from the gas phase doesn't change the importance of each mechanism, it just increases the rate of the reaction. In the presence of an oxide catalyst the contribution of the two mechanisms change. This result shows the importance of the sulphur species from the surface. The sites able to dissociate H_2S and H_2 are the same, and the dissociation is of heterolytic nature. The kinetic modeling of using the CHEMKIN/SURFACE CHEMKIN package seems to be a convenient method in order to understand the kinetic and mechanistic phenomena in hydrodenitrogenation. The preliminary simulations in the case of 2.6 diethylaniline showed that only one type of site is not sufficient to account for the experimental results. Further simulations will be necessary.

7903 (NUTEK-R–94-48) **Evaluation of instruments and incentives for limitation of carbon dioxide emissions in Sweden.** Swedish National Board for Industrial and Technical Development (NUTEK), Stockholm (Sweden). 1994. 32p. (In Swedish). Order Number DE95737687. Source: OSTI; NTIS.

The MARKAL model has been used to study how the CO2 emissions in Sweden are, and will be, affected by energy and emission taxes and by investment subsidies for renewable energy plants. For the period that these incentives have been in use, it is demonstrated that a CO2 reduction by 3-5 percent has been achieved. The tax increases of 1994 will lead to a further reduction of about 20 percent by year 2005. After 2005 a sharp increase of the emission is expected due to the planned onset of the nuclear power phaseout. 28 figs. 4 tabs

7904 (ANL/DIS/TM–21) **APEX user's guide - (Argonne production, expansion, and exchange model for electrical systems), version 3.0.** VanKuiken, J.C. (and others); Veselka, T.D.; Guziel, K.A.; Blodgett, D.W.; Hamilton, S.; Kavicky, J.A.; Koritarov, V.S.; North, M.J.; Novickas, A.A.; Paprockas, K.R. Argonne National Lab., IL (United States). Nov 1994. 485p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95006078. Source: OSTI; NTIS; (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020; GPO Dep.

This report describes operating procedures and background documentation for the Argonne Production, Expansion, and Exchange Model for Electrical Systems (APEX). This modeling system was developed to provide the U.S. Department of Energy, Division of Fossil Energy, Office of Coal and Electricity with in-house capabilities for addressing policy options that affect electrical utilities. To meet this objective, Argonne National Laboratory developed a menu-driven programming package that enables the user to develop and conduct simulations of production costs, system reliability, spot market network flows, and optimal system capacity expansion. The APEX system consists of three basic simulation components, supported by various databases and data management software. The components include (1) the investigation of Costs and Reliability in Utility Systems (ICARUS) model, (2) the Spot Market Network (SMN) model, and (3) the Production and Capacity Expansion (PACE) model. The ICARUS model provides generating-unit-level production-cost and reliability simulations with explicit recognition of planned and unplanned outages. The SMN model addresses optimal network flows with recognition of marginal costs, wheeling charges, and transmission constraints. The PACE model determines long-term (e.g., longer than 10 years) capacity expansion schedules on the basis of candidate expansion technologies and load growth estimates. In addition, the Automated Data Assembly Package (ADAP) and case management features simplify user-input requirements. The ADAP, ICARUS, and SMN modules are described in detail. The PACE module is expected to be addressed in a future publication.

7905 (DOE/EIA–0226(95/01)) **Electric power monthly: January 1995, with data for October 1994.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. Jan 1995. 203p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005611. Source: OSTI; NTIS; GPO; GPO Dep.

The Electric Power Monthly (EPM) presents monthly electricity statistics for a wide audience including Congress, Federal and State agencies, the electric utility industry, and the general public. The purpose of this publication is to provide energy decision makers with accurate and timely information that may be used in forming various perspectives on electric issues that lie ahead. The EIA collected the information in this report to fulfill its data collection and dissemination responsibilities as specified in the Federal Energy Administration Act of 1974 (Public Law 93-275) as amended.

7906 (DOE/EIA–0437(93)/1) **Financial statistics of major U.S. investor-owned electric utilities 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. Jan 1995. 623p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005365. Source: OSTI; NTIS; GPO; GPO Dep.

The Financial Statistics of Major US Investor-Owned Electric Utilities publication presents summary and detailed financial accounting data on the investor-owned electric utilities. The objective of the publication is to provide Federal and State governments, industry, and the general public with current and historical data that can be used for policymaking and decisionmaking purposes related to investor-owned electric utility issues.

7907 (DOE/EIA–0540(93)) **Electric sales and revenue: 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. Jan 1995. 230p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005669. Source: OSTI; NTIS; GPO; GPO Dep.

The Electric Sales and Revenue is prepared by the Survey Management Division, Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA); US Department of Energy. This publication provides information about sales of electricity, its associated revenue, and the average revenue per kilowatthour sold to residential, commercial, industrial, and other consumers throughout the United States. The sales, revenue, and average revenue per kilowatthour data provided in the Electric Sales and Revenue are based on annual data reported by electric utilities for the calendar year ending December 31, 1993. Operating revenue includes energy charges, demand charges, consumer service charges, environmental surcharges, fuel adjustments, and other miscellaneous charges. The revenue does not include taxes, such as sales and excise taxes, that are assessed on the consumer and collected through the utility. Average revenue per kilowatthour is defined as the cost per unit of electricity sold and is calculated by dividing retail sales into the associated electric revenue. Because electric rates vary based on energy usage, average revenue per kilowatthour are affected by changes in the volume of sales. The sales of electricity, associated revenue, and average revenue per kilowatthour data provided in this report are presented at the national, Census division, State, and electric utility levels.

7908 (DOE/EIA–0586) **Performance issues for a changing electric power industry.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. Jan 1995. 53p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006183. Source: OSTI; NTIS; GPO; GPO Dep.

Extremely cold weather created record demands for electricity in the eastern two-thirds of the United States during the week of January 16, 1994. Fuel-related problems, mostly the result of transportation constraints resulting from ice accumulation on roads and water-ways, and unexpected generating capacity outages at utilities and nonutilities resulted in demand not being met. Some utilities

asked nonessential customers along with State governments and a portion of the Federal Government to shut down. Two electric control areas, the Pennsylvania-New Jersey-Maryland Interconnection (PJM) and Virginia Electric & Power Company (VEPCO), instituted rolling blackouts. This disturbance was reported widely in the press and, along with other disturbances, peaked renewed interest in the reliability of the electric power system. The renewed interest in reliability has coincided with substantial changes that are beginning to occur in the structure and competitiveness of the electric power industry. Juxtaposing the question of reliability and the issue of changing industry structure leads to the central concern of this report: What effect, if any, will the changing structure of the industry have on the reliability of the system?

7909 (DOE/ER–0638) **Positioning the electric utility to build information infrastructure.** USDOE Office of Energy Research, Washington, DC (United States). Office of Scientific Computing. Nov 1994. 38p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006366. Source: OSTI; NTIS; GPO Dep.

In two particular respects (briefly investigated in this study from a lawyer's perspective), electric utilities appear uniquely well-positioned to contribute to the National Information Infrastructure (NII). First of all, utilities have legal powers derived from their charters and operating authorities, confirmed in their rights-of-way, to carry out activities and functions necessary for delivering electric service. These activities and functions include building telecommunications facilities and undertaking information services that have become essential to managing electricity demand and supply. The economic value of the efficiencies made possible by telecommunications and information could be substantial. How great remains to be established, but by many estimates electric utility applications could fund a significant share of the capital costs of building the NII. Though utilities' legal powers to pursue such efficiencies through telecommunications and information appear beyond dispute, it is likely that the effort to do so will produce substantial excess capacity. Who will benefit from this excess capacity is a potentially contentious political question that demands early resolution. Will this windfall go to the utility, the customer, or no one (because of political paralysis), or will there be some equitable and practical split? A second aspect of inquiry here points to another contemporary issue of very great societal importance that could very well become the platform on which the first question can be resolved fortuitously-how to achieve universal telecommunications service. In the effort to fashion the NII that will now continue, ways and means to maximize the unique potential contribution of electric utilities to meeting important social and economic needs–in particular, universal service–merit priority attention.

7910 (ETDE-DE–2) **Bayernwerk AG und -Konzern. Report on the 72nd business year from October 1, 1991 to September 30, 1992.** Bayernwerk AG, Muenchen (Germany). [1993]. 89p. (In German). Order Number DE95737795. Source: OSTI; NTIS (US Sales Only).

The tasks and activities of the German supraregional electric utility are described and numerous financial data (balance, statement of revenue and expenditure) is given in this annual report 1991/92. The Bayernwerk AG is responsible for supraregional power supply in Bavaria. It supplies regional and large municipal utility companies with electric energy. Apart from this it supplies some large consumers, the chemical industry, and the Deutsche Bundesbahn. The society sets up and operates plants for the production and distribution of electric energy and is responsible for interconnected operation in Bavaria, with other Federal and with neighbouring states. (orig.)

7911 (KTM/E-A–5) **The demand for electricity is growing but what about the production?.** Ministry of Trade and Industry, Helsinki (Finland). Energy Dept. 1994. 26p. (In Finnish). Order Number DE95737599. Source: OSTI; NTIS.

The medium-term economic outlook for Finland is assessed to be relatively good. Export industries have been raising their output already for a couple of years, and in the industries typically supplying the domestic market, too, a revival is expected to take place. The growth of output in the export industries largely explains why the demand for electricity went on increasing still in the early 1990s, despite the recession. During the latter half of the nineties, the outlook for electricity demand will decisively depend on the extent to which industries are able to invest over the next two or three years. The outlook is also connected with the success in the market penetration of new, energy efficient appliances and technologies. Supposing that investments will realize as foreseen by the economic policy and economic forecasts and that other sectors soon follow the example of export industries, the consumption of electricity would have to rise from this year's about 69 TWh to around 85 TWh in the year 2000 and perhaps to 96 TWh by the year 2005. Finland's existing capacity combined with that under construction will not satisfy such increase in the demand. The additional capacity needed under the expected conditions of the year 2000, which call for decisions to compensate the termination of the electricity import contract in force, would be about 2000 MW in that year and rise, by the year 2005, to no less than 4000 MW. The new capacity is anyhow likely to be provided through a combination of new power plants burning fossile or indigenous fuels and of electricity imports. This means, among other things, that the level of CO_2 emissions from power plants will rise markedly over the next ten years.

7912 (ORNL/TM–12855) **Progress in the standardization of DSM terminology, reporting formats, and evaluation protocols.** Berry, L. Oak Ridge National Lab., TN (United States). Oct 1994. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004792. Source: OSTI; NTIS; GPO Dep.

Evaluations of demand-side management programs are numerous and serve many purposes: assessing effectiveness, promoting program improvements, guiding planning processes, and determining the level of shareholder incentives. Although many program evaluations are available, it is difficult to combine or compare results because of inconsistencies in definitions, reporting formats, and evaluation methods. The increased use of explicit and standardized definitions of terms, consistent data reporting formats, and comparable methods is needed to make combining and comparing results across a range of programs, utilities, and state jurisdictional boundaries possible. Producing consistent and accurate comparisons of program experience is an important, although challenging and, therefore, under utilized, means of identifying the key elements of effective programs and of improving future programs. In spite of the importance of arriving at standard terminology and data reporting conventions, progress is slow. The purpose of this report is to assess progress toward standardization by reviewing attempts to promote standardization and by determining the degree of consistency in various sources. There are a number of efforts to promote standardization including regional utility efforts such as Northeast Regional DSM Data Exchange and NU-Trak in the Pacific Northwest, state regulatory commission requirements, and Lawrence Berkeley Laboratory and Oak Ridge National Laboratory databases and publications, which are national in scope. A variety of other organizations such as the Association of Demand-Side Management Professionals, the Electric Power Research Institute, the National Association of Regulatory Utility Commissioners, the Energy Information Administration, the Synergic Resources Corporation, the Environmental Protection Agency, and the National Association of Energy Service Companies have publications and/or training courses designed to promote greater standardization.

Sponsored by USDOE, Washington, DC (United States). Order Number DE95005791. Source: OSTI; NTIS; GPO; GPO Dep.

Two major industry groups–the chemicals and allied products industry and the petroleum and coal products industry–accounted for more than half of US 1991 manufacturing primary energy consumption, which totaled 20.3 quadrillion Btu. Those two groups and four others (paper and allied products; primary metals; food and

kindred products; and stone, clay, and glass products) accounted for 88 percent of the 1991 total. Those are among the results of the 1991 Manufacturing Energy Consumption Survey (MECS), which is one of four major energy end-use surveys conducted by the Energy Information Administration (EIA) and the only comprehensive source of national-level data on US manufacturing energy use. The 1991 MECS is the third in an ongoing series of surveys conducted at 3-year intervals through 1994.

Solid oxide fuel cells are attracting considerable interest among industrial organizations wanting to position themselves in a potentially important technology of the future. More than a dozen new organizations worldwide have begun SOFC development in the last few years. Most of this R and D activity is in the planar technology, because it represents a good compromise between the proven but IR-limited tubular configuration and the high-performance but difficult-to-fabricate monolithic structure. The challenges of developing the planar cell configurations are finding high-temperature edge and manifold seal materials that will make very flat ceramic trilayers of sufficiently large area, and minimize contact resistances in stacks of cells. Also, decreasing the operating temperature requires development of reliable thin-film fabrication methods for the electrolyte, and finding a metal with good oxidation resistance and a thermal expansion coefficient well matched with the different cell components. Finally, toughness and a thermal stress tolerance of stacks need to be improved.

7916 (DOE/MC/26006–3824) **Monolithic solid oxide fuel cell technology advancement for coal-based power generation. Final report, September 1989–March 1994.** Allied-Signal Aerospace Co., Torrance, CA (United States). May 1994. 377p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26006. Order Number DE94012258. Source: OSTI; NTIS; GPO Dep.

This project has successfully advanced the technology for MSOFCs for coal-based power generation. Major advances include: tape-calendering processing technology, leading to 3X improved performance at 1000 C; stack materials formulations and designs with sufficiently close thermal expansion match for no stack damage after repeated thermal cycling in air; electrically conducting bonding with excellent structural robustness; and sealants that form good mechanical seals for forming manifold structures. A stack testing facility was built for high-spower MSOFC stacks. Comprehensive models were developed for fuel cell performance and for analyzing structural stresses in multicell stacks and electrical resistance of various stack configurations. Mechanical and chemical compatibility properties of fuel cell components were measured; they show that the baseline Ca-, Co-doped interconnect expands and weakens in hydrogen fuel. This and the failure to develop adequate sealants were the reason for performance shortfalls in large stacks. Small (1-in. footprint) two-cell stacks were fabricated which achieved good performance (average area-specific-resistance 1.0 ohm-cm^2 per cell); however, larger stacks had stress-induced structural defects causing poor performance.

7917 (DOE/MC/26006–3960) **Monolithic solid oxide fuel cell technology advancement for coal-based power generation. Quarterly technical progress report, January–March 1994.** Department of Energy, Morgantown, WV (United States). Morgantown Energy Technology Center. 25 Oct 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26006. Order Number DE95006152. Source: OSTI; NTIS; GPO Dep.

Objective is to advance materials and fabrication methods to develop a monolithic solid oxide fuel cell (MSOFC) system for coal-based power generation. Focus is on materials R and D, fabrication process development, cell/stack performance testing and characterization, cost and system analysis, and quality development.

7918 (DOE/METC–94/1010, pp. 3-8) **Tubular Solid Oxide Fuel Cell Development Program.** Ray, E.R. (Westinghouse Electric Corp., Pittsburgh, PA (United States)). Source: OSTI; NTIS; GPO Dep.

This paper presents an overview of the Westinghouse Solid Oxide Fuel Cell (SOFC) development activities and current program status. Our goal is to develop a cell that can operate for 50,000 to 100,000 hours. Progress toward this goal will be discussed and test results presented for multiple single cell tests which have now successfully exceeded 48,000 hours of continuous power operation at temperature. Curves are presented which demonstrate the improved cell performance and life obtained to date.

The development of a viable fuel cell electrical power generation system involves not only the development of cell and stack technology, but also the development of the overall system concept, the strategy for control, and the ancillary subsystems. The design requirements used to guide system development must reflect a customer focus in order to evolve a commercial product. In order to obtain useful customer feedback, Westinghouse has practiced the deployment with customers of fully integrated, automatically controlled, packaged solid oxide fuel cell power generation systems. These field units have served to demonstrate to customers first hand the beneficial attributes of the SOFC, to expose deficiencies through experience in order to guide continued development, and to garner real world feedback and data concerning not only cell and stack parameters, but also transportation, installation, permitting and licensing, start-up and shutdown, system alarming, fault detection, fault response, and operator interaction.

Protonic conductivity in the strontium ytterbium cerates was shown to have a large grain boundary component. Protonic conductivity in these materials requires the presence of water, which reacts with oxygen vacancies to yield hydroxyl groups that support proton conduction. Transference numbers were determined for protons, oxygen ions, and electrons as a function of temperature. Protonic conduction dominated in hydrated cerates up to 450°C. At higher temperatures, oxygen ion and electronic conductivity became progressively more important. Hydrogen could be pumped across the cerate membrane by applying a dc voltage. At 800°C, pure hydrogen fluxes greater than 1 sccm/cm^2 could be driven across the membrane.

The purpose of this research is to develop alternate materials for solid oxide fuel cell (SOFC) interconnections and electrodes with improved electrical, thermal, and electrochemical properties. A second objective is to develop synthesis and fabrication methods for these materials whereby they can be processed in air into SOFCs. The approach is to (1) develop modifications of the current, state-of-the-art materials used in SOFCs, (2) minimize the number of cations used in the SOFC materials to reduce potential deleterious interactions, (3) improve thermal, electrical, and electrochemical properties, (4) develop methods to synthesize both state-of-the-art and alternative materials for the simultaneous fabrication and consolidation in air of the interconnections and electrodes with the solid electrolyte, and (5) understand electrochemical reactions at materials interfaces and the effects of component composition and processing on those reactions.

Source: OSTI; NTIS; GPO Dep.

The purpose of this work is to develop technology for a planar solid oxide fuel cell (SOFC) which uses a thin electrolyte and operates at about 800°C. The two major tasks of this effort are: (1) develop a conductive bond layer between the electrodes and the interconnect and (2) integrate a metallic interconnect into the stack which is well matched with the other cell components with regard to thermal expansion and is adequately protected from corrosion.

7924 (DOE/METC–94/1010, pp. 38-40) **Multiply manifolded molten carbonate fuel cells.** Krumpelt, M. (Argonne National Lab., IL (United States)); Roche, M.F.; Geyer, H.K.; Johnson, S.A. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

This study consists of research and development activities related to the concept of a molten carbonate fuel cell (MCFC) with multiple manifolds. The objective is to develop an MCFC having a higher power density and a longer life than other MCFC designs. The higher power density will result from thinner gas flow channels; the extended life will result from reduced temperature gradients. Simplification of the gas flow channels and current collectors may also significantly reduce cost for the multiply manifolded MCFC.

7925 (DOE/METC–94/1010, pp. 41-42) **Lithium ferrate and lithium cobaltate cathodes for molten carbonate fuel cells.** Krumpelt, M. (Argonne National Lab., IL (United States)); Roche, M.F.; Bloom, I.D.; Indacochea, J.E.; Kucera, G.H. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract W-31109-ENG-38. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to develop cathodes for the molten carbonate fuel cell (MCFC) having a performance approaching that of the lithiated nickel oxide cathode and a significantly greater life, particularly in pressurized MCFCs. To meet this objective, cathodes containing either doubly doped lithium ferrate or lithium cobaltate are being developed.

7926 (DOE/METC–94/1010, pp. 43-48) **Carbonate fuel cell analysis.** Bernard, R. (Energy Research Corp., Danbury, CT (United States)); Hunt, J.; Paetsch, L.; Skok, A.; Yuh, C. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract AC21-93MC30054. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

Power plant system studies indicate that carbonate fuel cell systems have the potential of offering high efficiency, competitive cost and environmentally superior power plants operating on coal. The overall objective of the project was to demonstrate carbonate fuel cell compatibility with coal-derived gases; the specific objective of this project was to assess the possible effect of contaminants on the performance and life of a carbonate fuel cell. The approach taken was to test a 20kW fuel cell stack using actual coal-gas, to monitor its performance relative to a standard and to perform a detailed post-test analysis of the stack to determine long term operating issue(s), if any.

7927 (DOE/METC–94/1010, pp. 49-50) **Molten carbonate fuel cell with high power density.** Krumpelt, M. (Argonne National Lab., IL (United States)); Roche, M.F.; Bloom, I.D.; Geyer, H.K.; Johnson, S.A. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract W-31109-ENG-38. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

The objective of this research is a doubling of the current density of the molten carbonate fuel cell (MCFC) from the present value of 1600 A/m^2 to 3200 A/m^2 and a similar increase in the volumetric power density.

7928 (DOE/METC–94/1010, pp. 51-52) **Pitting corrosion of aluminized seals in molten carbonate fuel cells.** Krumpelt, M. (Argonne National Lab., IL (United States)); Roche, M.F.; Bloom, I.D. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract W-31109-ENG-38. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to gain a better understanding of the corrosion of the aluminized Type 316 stainless steel (SS) employed in the seal areas of the molten carbonate fuel cell (MCFC). The seals are formed between the aluminized Type 316 SS surface and the electrolyte (generally a mixture of molten alkali carbonates and lithium aluminate). These "wet" seals are used at the periphery of the MCFC and around the gas manifolds that deliver fuel and oxidant to the anode and cathode of the MCFC. They contain the anode and cathode gases within the MCFC. Of particular interest in this study is measurement of the pitting corrosion of the aluminized Type 316 SS in the seal areas of the MCFC.

7929 (DOE/METC–94/1010, pp. 53-65) **Processing of $LaCrO_3$ for solid oxide fuel cell applications.** Huebner, W. (Univ. of Missouri, Rolla, MO (United States)); Anderson, H.U. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract FG21-93MC29224. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

The University of Missouri-Rolla is performing a 5 year research program dedicated towards the development of $LaCrO_3$-based interconnect powders which densify when in contact with anode and cathode materials for solid oxide fuel cells (SOFC). During a previous DOE-METC Program (DE-FG21-89MC26015) we developed and characterized potential cathode and interconnect materials. During the course of this program we investigated compositions within the pseudo-ternary $LaCrO_3$-$LaMnO_3$-$LaCoO_3$ system. Results indicated that some of the compositions in this system exhibited the requisite electrical conductivity and stability towards reduction, and could be sintered in air at temperatures less than 1450°C.

7930 (DOE/METC–94/1010, pp. 66-71) **Sealant materials for the solid oxide fuel cell.** Krumpelt, M. (Argonne National Lab., IL (United States)); Kumar, R.; Bloom, I.; Ley, K.L. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract W-31109-ENG-38. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

The objective of this work is to develop sealing materials for solid oxide fuel cells (SOFCs). A suitable sealant must form strong, dense bonds with SOFC components, be chemically stable and mechanically compatible with the components at the operating temperature and over the temperature range of interest, be chemically stable in the operating environment of the SOFC (i.e., H_2 and H_2O on the anode side, O_2 on the cathode side), and must be electronically insulating.

7931 (DOE/METC–94/1010, pp. 72) **Trace species removal for fuel cell application.** Pigeaud, A. (Energy Research Corp., Danbury, CT (United States)); Gelb, A. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

The development of advanced, potentially very clean, coal-fired energy conversion requires integration with reliable and efficient, cleanup systems which can remove almost all gaseous contaminants and metallic vapor species from high-temperature, high-pressure gas streams down to sub-ppm concentration levels. In the thermal as well as electrochemical conversion systems, the removal of polluting trace elements to very low levels is becoming a mandatory necessity both in terms of the decay that contaminants such as: HCl, metal sulfides, arsine, alkali, metals, zinc, cadmium, lead and mercury vapors, can have on energy conversion equipment, and that can also seriously affect the environment if emitted into the atmosphere. The objective of current work at ERC has therefore been to develop a novel, high temperature polishing concept using a liquid-metal-alloy "getter" for scrubbing hot coal-derived fuels. A patent has been applied for this invention which basically proposes to scrub hot reducing gases with a reactive liquid metal alloy by pumping it at elevated temperatures over a high efficiency, gas/liquid-film, contacting device in countercurrent fashion. This is to remove a number of contaminants and hazardous air pollutants (or HAP's) from hot fuel gas containing very low levels. Results from equilibrium thermogravimetric analysis are quite promising with respect to arsenic and a number of other metallic species. Reactor design for the scrubber has been completed and is currently being fabricated.

7932 (DOE/METC–94/1010, pp. 73-79) **Macrocyclic redox promoters for direct methanol fuel cells.** Sarangapani, S. (ICET, Inc., Norwood, MA (United States)); Sarangapani, S.; Morriseau, B. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract FG02-91ER81186. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

Direct methanol fuel cell (DMFC) powered vehicles are foreseen as the choice of the future, because of its environmentally benign combustion products, potential for high efficiency and above all for its unlimited supply within United States. The major obstacle in the development of methanol fuel cell is the methanol electrode, particularly, a catalyst for the oxidation of methanol. No stable and active catalysts exist that can oxidize methanol for long periods of time without the loss of efficiency. Our research has identified certain transition metal macrocyclic complexes as promoters for Pt during methanol oxidation. Half-cell studies of some of these promoters show 100-150 mV improvement over the control at 8 times less platinum loading compared to the control. These results were reported in the last DOE Joint Contractors Meeting. We now present an update of these results, together with the results of full cells employing our catalyst promoters.

7933 (DOE/METC–94/1010, pp. 80-87) **Perovskite solid electrolytes for SOFC.** Sammells, A.F. (Eltron Research, Inc., Boulder, CO (United States)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract FG02-90ER80910. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

The objective of this program is to experimentally determine the utility of selected perovskite related solid electrolytes for application in SOFC's operating at intermediate temperatures (600-750°C). Specific technical objectives addressed in this program include: Gaining useful insight into those crystallographic and thermodynamic parameters which influence both activation energy (E_a) for ionic transport and the population of ionic charge carriers, synthesizing selected perovskite related solid electrolyte powders expected to possess (i) low E_a for ionic conduction and (ii) an intrinsically high population of ionic charge carriers, preparing sintered solid electrolyte disks and determine their ionic conductivity, incorporating solid electrolytes demonstrating acceptable ionic conductivity into small research size SOFC's operating at intermediate temperatures and determine their electrochemical performance, and determining the long-term stability of selected solid electrolyte materials incorporated into SOFC's.

7934 (DOE/METC–94/1010, pp. 88-92) **A practical method of hydrogen purification for use in fuel-cell systems.** Edlund, D.J. (Bend Research, Inc., Bend, OR (United States)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract FG03-91ER81229 ; FG03-91ER81228 ; FG03-92ER81419. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

These programs are directed at the development of a practical and economical composite-metal membrane for use in high-temperature hydrogen-separation/purification processes. One potential application of this technology is for the purification of hydrogen, made by hydrocarbon reforming or partial oxidation reactions, for use in fuel cells to produce electricity. Although this applications falls outside the scope of the referenced SBIR contracts, the technology has advanced under these programs to the point where initial feasibility tests have been conducted by Ballard Power Systems using a high-pressure methanol/steam reformer are shown. The general features of an integrated fuel-cell system in which hydrogen is produced in a hydrocarbon reformer, purified, and then fed to the fuel cells. Generally speaking, the hydrogen-purification method should meet the following requirements: produce high-purity hydrogen; be compact in size and weight; have low parasitic power requirements; exhibit rapid load-following capability; and be affordable. The metal-membrane technology under development at Bend Research has the potential to meet these requirements.

7935 (DOE/METC–94/1010, pp. 93-102) **Investigation of wetting phenomena and oxidation/lithiation behavior of nickel in molten carbonate.** Selman, J.R. (Illinois Institute of Technology, Chicago, IL (United States)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract AC21-90MC27394. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

Performance improvement and quantitative understanding of the long-term performance decay which may take place in MCFC stacks are the key points for the success of molten carbonate fuel cells (MCFC) for the coming century. By considering these points: (1) Meniscus formation on metal electrodes in molten carbonate is investigated. The objective is to clarify the phenomena in the boundary region among electrode, gas and molten carbonate under cathode gas conditions. (2) Oxidation of nickel foil in-situ under an oxidant atmosphere is relevant for an understanding of the in-situ oxidation process to which nickel sinters are subjected in some MCFC stacks. The potential of the nickel foil is monitored while the oxidation and partial dissolution of the foil is followed optically and recorded on videotape. Additionally, the cathodic dissolution and the particle behavior are discussed to understand and quantify the conditions that may lead to high ohmic shorting of MCFC.

7936 (DOE/METC–94/1010, pp. 113-117) **MCFC development for logistic fuel applications.** Patel, P. (Energy Research Corp., Danbury, CT (United States)); Piwetz, M.; Steinfeld, G. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. Contract NAS3-27021. Energy Research Corporation (ERC) is conducting a program for the development of fuel cell power plants for fixed and bare-base DoD applications under the ARPA "Fuel Cell Power Plant Initiative." ERC will adapt its direct carbonate fuel cell power plant technology in combination with a logistic fuel processing system for this dual use power plant application. This development is expected to improve the efficiency, fuel flexibility, emissions, and thermal and acoustic signatures of future fixed-base and mobile power plants. Bare-base power systems are required to rapidly establish a sustainable operation at a location vital to various military missions. These power systems may be used globally, in all seasonal environments, and in any of the climate extremes listed in MIL-STD-210B. The power systems must be rugged, portable, reliable, affordable, and simple to maintain.

7937 (DOE/METC–94/1010, pp. 118-119) **SOFC development for logistics fuel applications.** Veyo, S.E. (Westinghouse Electric Corp., Orlando, FL (United States)); Piwetz, M.M.; Moss, W.E. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. Contract NAS3-27022. Westinghouse has undertaken a two year project under sponsorship of the Advanced Research Projects Agency (ARPA) to develop and demonstrate the technology enabling use of logistics fuels, diesel fuel (DF-2) and jet turbine fuel (JP-8), in Solid Oxide Fuel Cell (SOFC) Power Systems for fixed military bases and bare base deployment. The project is administered by the National Aeronautics and Space Administration (NASA). The project team includes as major subcontractors Haldor Topsoe, Inc. (HTI) and Southern California Edison (SCE). The project will culminate in the demonstration at SCE's Highgrove Fuel Cell Test Center of an SOFC power plant fueled by logistics fuels. The SOFC generator module (stack) will employ the air electrode supported (AES) tubular SOFC developed by Westinghouse under a cooperative agreement with the Department of Energy (DOE), Morgantown Energy Technology Center (METC). The AES-SOFC stack will have a maximum output of 30 kWe. The Logistics Fuel Processor (LFP) is under development by Haldor Topsoe, Inc. and will provide a sulfur free, methane rich fuel stream to the SOFC. HTI will construct a brass-board LFP as a non-integrated subsystem that will be coupled to an SOFC system now in place at the SCE site. Prior to the SOFC/LFP demonstration, the fuel cell stack presently in use at the SCE site will be replaced with a new one employing the AES-SOFC. SCE will install and operate the SOFC/LFP system.

7938 (DOE/METC–94/1010, pp. 123-130) **Update: Commercialization of the direct fuel cell.** Baker, B.S. (Energy Research Corp., Danbury, CT (United States)); Bentley, C.R.; Glenn, D.R. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

The commercialization of the Direct Fuel Cell (DFC), ERC's trade name for its internal reforming carbonate fuel cell technology, moved into an important phase this past year. Activities were characterized by extensive testing both at ERC and user sites. The next period requires a continuation of a product improvement program to further refine all aspects of the stack, module and plant system, while concurrently affecting the transition from a technology-driven effort to a full scale prototype power plant hardware demonstration.

7939 (DOE/METC–94/1010, pp. 131-134) **Overview of MCFC commercialization strategy.** Laurens, R.M. (M-C Power Corp., Burr Ridge, IL (United States)); Petraglia, V.J. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract AC21-90MC27394. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

M-C Power Corporation (MCP) was founded in 1987 with the sole purpose of commercializing the IMHEX® molten carbonate fuel cell (MCFC), invented by the Institute of Gas Technology (IGT). IMHEX uses internal manifolding to distribute both anode and cathode fuel and exhaust gases. The design is similar to that used in commercial flat plate, internally manifolded heat exchangers, hence the name IMHEX. Like its commercial counterpart, this

design allows the use of a single vertical force to maintain all manifold and edge-of-stack seals while simultaneously maintaining electrical cell-to-cell continuity. The design has been successfully operated with 11-square foot commercial size cells in 20-cell short stacks. Full commercial height stacks of 250 cells will be tested at Unocal later this year and in San Diego mid next year. M-C Power's commercialization plan encompasses five key strategies: Achieve development program goals, Establish strategic alliances with other firms, Secure contingent orders for our market-entry units, Construct new manufacturing facility to meet future production growth, and Reduce product costs for both market-entry and future production.

7940 (DOE/METC–94/1010, pp. 135-137) **The alliance to commercialize carbonate technology: A revitalized industry commitment to IMHEX® fuel cell commercialization.** Nimmons, J.T. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

The Alliance to Commercialize Carbonate Technology, or ACCT, is a key element in the commercialization strategy for IMHEX molten carbonate fuel cell (MCFC) technology. It is a working alliance among prospective buyers and users of MCFC's, and between those organizations and the team that is designing and developing, and will manufacture and distribute, IMHEX power plants. ACCT organizations include privately- and publicly-owned electric, gas, combination, and other utilities, natural gas pipelines, independent power producers, institutional and industrial users, and representatives of the IMHEX development team led by M-C Power Corporation. ACCT was formed in 1991 to stimulate the commercialization of MCFC's using technology pioneered by the Institute of Gas Technology, and now under commercial development by M-C Power and other IMHEX team members. ACCT's activities since then have reflected M-C Power's step-by-step approach to MCFC commercialization, based on lessons learned from earlier fuel cell efforts by others. ACCT Task Force members have affirmed the following organizational objectives: to increase industry understanding of MCFC technology and applications, and the regulatory and business environment in which they will compete; to help focus and support IMHEX development and demonstration efforts in areas of critical interest to member organizations; to provide opportunities for members to shape commercial power plant design, participate in demonstrations, and share early MCFC experience; to build members' confidence that power plant performance, reliability, and durability can be achieved at competitive costs; and to develop a framework for early power plant purchase commitments.

7941 (DOE/METC–94/1010, pp. 138-144) **Status of Santa Clara MCFC product development test.** Leo, A.J. (Fuel Cell Engineering Corp., Danbury, CT (United States)); Kush, A.K.; O'Shea, T.P. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract FC21-92MC29237. Source: OSTI; NTIS; GPO Dep.

The objective of the 2MW Santa Clara Demonstration Project is the demonstration of the carbonate fuel cell technology at full scale. Additional objectives of the project include the demonstration of specific advantages of the carbonate fuel cell power plant, such as high efficiency, low emissions, reactive power capability, and high reliability and availability. The project will also provide a design basis for pre-commercial early production power plants.

7942 (DOE/METC–94/1010, pp. 145-148) **Status of 250 kW product development test at San Diego Gas & Electric.** Figueroa, R.A. (San Diego Gas & Electric, CA (United States)); Scroppo, J.A. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. Source: OSTI; NTIS; GPO Dep.

San Diego Gas & Electric (SDG&E) is participating in the product development test (PDT) program with the Department of Energy (DOE) and M-C Power, Incorporated, in cost sharing the development of M-C Power's internally manifolded heat exchanger (IMHEX) carbonate fuel cells. The results of this work will be a test of a 250 kW net power plant to be installed and operated by SDG&E. SDG&E's responsibilities include host site selection, development and plant construction and operation. The primary purpose of this paper to present an update of the status of the host site for the PDT 250 kW net power plant and progress of manufacturing and supply of key plant components.

(CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

ERC's carbonate fuel cell goals are commercialization of MW-Class natural gas/logistic fuel units in the near-term and 100MW-Class coal gas/natural gas dual-fuel units long-term. As a major milestone towards achieving this objective, ERC's subsidiary Fuel Cell Engineering Corp. is constructing a 2MW natural gas power plant at the City of Santa Clara, CA for demonstration in the 1995-1996 time frame. The on-going program effort has prepared this efficient energy conversion technology for the demonstration.

Source: OSTI; NTIS; GPO Dep.

Molten carbonate fuel cells have been under development for many years and on a small scale they can reliably and efficiently produce power. However, they are costly and to compete successfully with other electrical power production methods the cost must be reduced. The partners in this project are building a 250 Kilowatt molten carbonate fuel cell demonstration plant. The plant will show that the technology exists to build large scale molten carbonate fuel cells and operate them successfully. Information obtained from the plant construction and operation will also be used in the design and construction of future plants and will aid in reducing costs. This progress report discusses construction of the demonstration plant at Unocals' Fred L. Hartley Research Center in Brea, California.

Source: OSTI; NTIS; GPO Dep.

An overview of recent fuel cell development and commercialization plans in Europe and Japan is presented. In Japan, the Moonlight Program which, starting in 1980, led to the successful demonstration and testing of 1 MW PAFCs and 100 kW MCFCs, is now being continued as the "New Sunshine Program," with the goal of demonstrating 1 MW MCFC plants having at least 45% (HHV) efficiency, in 1997. Most major Japanese utilities cooperate with the developers in Technology Research Associations, which take care of developing and optimizing the Balance-of-Plant (BOP). In parallel with these major efforts, SOFC development is being pursued, by private programs funded by utilities as well as government programs. Recently, though, SOFC development appears to

have lost some vigour compared to the advances in MCFC performance, especially of the DIRMCFC. Moreover, since 1992 a solid polymer (PEMFC) fuel cell development program has been started by the Japanese Government. In Europe several national MCFC programs are in progress: in the Netherlands, Italy, and Germany, each closely allied with a U.S. developer. However, the major part of European and government and European Community fuel cell funding goes toward SOFC and PEMFC. The PEMFC development is directed at transportation applications and includes a significant activity in developing direct methanol fuel cells as well as methanol-reformate fueled PEMFCs, in developing direct methanol fuel cells as well as methanol-reformate fueled PEMFCs.

7946 (RISO-R–762(EN)) **Thermoelectric power of solid oxide fuel cell materials.** Ahlgren, E.O. Risoe National Lab., Roskilde (Denmark). Materials Dept.; Danmarks Tekniske Univ., Lyngby (Denmark). Oct 1994. 154p. Order Number DE95737593. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

Thermoelectric power of state-of-the-art and alternative solid oxide fuel cell (SOFC) materials is investigated. Results are explained by existing theory on thermoelectric power of ionic, electronic and mixed conductors. The formulas are discussed. Methods to determine the ionic transference number and to detect predominant proton conduction are proposed. The thermoelectric effects in an SOFC under operation are estimated. In spite of the Peltier heat being found to be large, the thermoelectric effects in an SOFC will be of limited importance. (au) (7 tabs., 43 ills., 239 refs.)

7947 (BNL–52430, pp. 17-26) **Part I - Oil heat technology research and development. Part II - NAECA 2002, what, when, and who?.** Kweller, E. (Dept. of Energy, Washington, DC (United States)); McDonald, R.J. Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the 1994 oil heat technology conference and workshop.* 216p. Order Number DE95003023. Source: OSTI; NTIS; GPO Dep.

The goal of the BNL Oil Heat R&D program is to reduce residential and small commercial building primary energy use for oil-fired heating systems by 0.35 quad (60 million barrels) annually by the year 2000. The objective is to provide technology advances which allow industry to develop products and adopt practices for cleaner combustion and improved efficiency. A major program goal is the development of low-emission burner and combustion indicator and/or control options which allow optimal performance to be maintained over the heating season. The DOE is mandated by Congress, through the National Appliance Energy Conservation Act of 1987 (NAECA), to periodically review and revise (if warranted) efficiency standards for heating appliances (including oil-fueled). Legislation (NAECA) has standardized labeling practices and established minimum performance levels for all major energy-using residential appliances. DOE developed standardized test procedures to be used in the appliance labeling program administered by the Federal Trade Commission (FTC). The Annual Fuel Utilization Efficiency (AFUE) rating is defined as "the ratio of annual output energy to annual input energy which includes any non-heating season input loss...for gas- or oil-fired furnaces and boilers, AFUE does not include electric energy." The new standards could be written to enforce a minimum AFUE level, as currently employed, or can require specific inclusion of design items, or both. DOE must take into consideration the benefits of any modifications to the current standards versus the costs associated with manufacturing, reliability, safety, and consumer costs associated with the changes. If an increase in the minimum efficiency standards results in an unreasonable cost-to-benefit ratio, DOE would not be likely to pursue it.

7948 (BNL–52430, pp. 27-44) **Oil heat technology - efficiency training manual.** Batey, J.E. (Energy Research Center, Inc., Easton, CT (United States)). Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the 1994 oil heat technology conference and workshop.* 216p. Order Number DE95003023. Source: OSTI; NTIS; GPO Dep.

Brookhaven National Laboratory (BNL) recently completed work on an Oil Heat Technology - Efficiency Training Manual that was produced to help experienced service technicians improve the efficiency of oil heating systems in homes. It contains the latest information from BNL and other sources concerning the design, installation, adjustment, and servicing of oil heating equipment for the highest efficiency. This manual was written to supplement existing oil heat training manuals that focus primarily on basic design, safety, reliable operation, and repair of oil heating equipment.

7949 (BNL–52430, pp. 45-52) **Update on the build with oil program and the oilheat manufacturers association.** Hedden, R. (Oil Heat Management Services, Pawlet, VT (United States)). Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). For the second year in a row the Oilheat Industry was represented at the National Home Builders Show. Once again over 600 builders stopped at the Build With Oilheat booth and walked away with a better understanding of the advantages of oilheat. The builders were very receptive to the Oilheat Message. They shared a general dissatisfaction with propane, and electrical heat, and even expressed some unhappiness with Natural Gas. The conclusion of those of us working the booth was that the custom home builder can definitely be sold on oilheat as a clean, modern, and energy efficient option for home heating. Someone just has to go sell it to them. The Build With Oil Program was invented by Don Farrel of Fuel Oil & Oil Heat. Don continues to serve as the driving force behind the program. Last year the twenty foot booth appeared not only at the National Home Builders Show, it also appeared at the Mid-Atlantic Builders Show. The Atlantic Region Energy Expo, and the New England Fuel Institute (NEFI) Show. This year, thanks to the support of 34 Oilheat manufacturers and associations, it is scheduled for the National Show in Las Vegas, The New England Builders Conference, The Custom Builders and Remodelers Expo, and the Mid-Atlantic Builders Conference.

7950 (BNL–52430, pp. 53-60) **Canadian R&D on oil-fired combustion systems.** Hayden, A.C.S. (CCRL/ERL/CANMET, Ottawa (Canada)); Entchev, E. Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the 1994 oil heat technology conference and workshop.* 216p. Order Number DE95003023. Source: OSTI; NTIS; GPO Dep.

This paper describes research and development presently being conducted on oil-fired space and water heating systems at the Combustion & Carbonization Research Laboratory (CCRL) in Ottawa, Canada. A primary topic to be discussed is the R&D program to develop a low output integrated oil heating system, suitable for new, energy-efficient housing. R&D activities at CCRL relating to the development of a seasonal efficiency standard will also be described, as will efforts to resolve issues relating to sidewall venting.

7951 (BNL–52430, pp. 61-76) **Nitrogen oxides (NO_x) and oil burners.** Butcher, T.A. (Brookhaven National Lab., Upton, NY (United States)); Fisher, L.A.; Kamath, B.; Kirchstetter, B.; Batey, J. Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the*

1994 oil heat technology conference and workshop. 216p. Order Number DE95003023. Source: OSTI; NTIS; GPO Dep.

Without question, there is a worldwide trend toward more restrictive limitations on combustion source emissions of NO_x and other pollutants. Will emission limitations be widely imposed on U.S. residential, oil-fired heating appliances in the future? Even if they remain unregulated, will emissions be an important factor in the energy policies of federal, state and local government? Because of future uncertainties, the oil heat industry should be aware of the level of its emissions relative to other emission sources and fuels. In addition, the industry should understand options available for future emissions reduction. The purpose of this paper is to provide a review of one of the most relevant emissions from oil burners - NO_x. Over 200 years ago, J.B. Priestly did an experiment with a bell jar. He lit yellow phosphorous and burned it in a small porcelain boat floating in water. The whole test was covered with the bell jar with an open stopper. After lighting the phosphorous, he plugged the bell jar. Water started to rise from the bottom and occupied one-fifth of the volume of the jar after the burning stopped. Priestly concluded that only one-fifth of air is oxygen. He called the remaining, inert gas nitrogen. It is this nitrogen from the air as well as the trace amounts of nitrogen in fuels which combine with oxygen in flames to produce NO_x.

7952 (BNL–52430, pp. 77-93) **The fan atomized burner - status and application testing.** Butcher, T.A. (Brookhaven National Lab., Upton, NY (United States)); Celebi, Y.; Fisher, L.A. Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the 1994 oil heat technology conference and workshop.* 216p. Order Number DE95003023. Source: OST!; NTIS; GPO Dep.

The development of advanced oil burner concepts has long been a part of Brookhaven National Laboratory's (BNL) oil heat research program. Generally, the goals of this work include: increased system efficiency, reduced soot, and the practical extension of the firing rate range of current burners to lower input rates. Secondary, but still obviously important, goals include reduced emissions of other pollutants such as NO_x and firing rate modulation (step or continuous). A number of very interesting designs for achieving some or all of these goals have been developed to varying degrees in the past some as part of the BNL program. Air atomization, blue flame (recirculating), and prevaporization burners have received attention. Reasons why these are not currently available commercially vary but generally include: high cost, poor reliability, excessive complexity (difficult to service) and others.

7953 (BNL–52430, pp. 95-102) **Residential fuel quality study (Part II).** Santa, T.S. (Santa Fuel Inc., Bridgeport, CT (United States)). Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the 1994 oil heat technology conference and workshop.* 216p. Order Number DE95003023. Source: OSTI; NTIS; GPO Dep.

This is a continuation of a study begun in September 1992 to determine the cause of residential fuel system failures. This is an assessment of actions taken to reduce such failures. While the mechanics of these problems are fairly well known very little has been done to determine the effectiveness of corrective actions in the field. Failure reduction actions in various test areas were initiated beginning in January 1993. These actions included: (1) Change in underground tank filling procedure; (2) Biocide treatment of tanks in a select group of accounts; (3) Introduction of a fuel stability and metal deactivation additive; (4) Use of "spun filament" fuel filter in place of felt medium filter in a select group of accounts. The control benchmark in this study is the data collected in the 9/92 to 1/93 period before corrective actions were initiated. The assessment consists of comparisons of fuel filter change rates for selected test groups of residential heating oil accounts in southern Connecticut for the periods September to December, 1992 versus 1993. Fuel filter changes by date, tank size, fuel filter type and additive treatment type is data which is readily available from most residential fuel supplier data bases.

7954 (BNL–52430, pp. 105-122) **Catalase as an indicator of microbial contamination in fuel oil.** Passman, F.J. (Biodeterioration Control Associates, Chicago, IL (United States)). Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the 1994 oil heat technology conference and workshop.* 216p. Order Number DE95003023. Source: OSTI; NTIS; GPO Dep.

Uncontrolled microbial contamination in fuel systems has a significant adverse economic impact on burner and generator operations. Participants in the fuel refining, distribution, retailing and consumption markets have only recently begun to recognize this fact. One reason for this is that research on the relationship between microbial growth and fuel performance problems rarely reaches a broad industrial audience in the past. Additionally, many engineers and fuel chemists perceived microbiology to be an arcane science, which relied on methodologies significantly different from those in which they had been trained. Consequently, analysts rarely included microbiological assays in routine fuel quality testing programs. Plugged filters, heavy sludge deposits, high acid numbers and spot corrosion were rarely attributed to uncontrolled microbial contamination. Obtaining timely accurate microbiological data remains obstacle to effective contamination control.

7955 (BNL–52430, pp. 123-130) **Premium performance heating oil.** Hoskin, D. (Mobil Research and Development Corporation, Paulsboro, NJ (United States)); McClintock, B.; Esposito, F.; Trout, R.; Martenak, T. Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the 1994 oil heat technology conference and workshop.* 216p. Order Number DE95003023. Source: OSTI; NTIS; GPO Dep.

This paper describes three aspects of heating oil quality where premium performance may prove valuable to the oil heat industry: fuel stability, dispersancy, and corrosion. Bench tests previously developed to quantify fuel stability (Accelerated Stability Test) and dispersancy performance (Sundstrand Pump Test) are described in detail. Experimental results are presented that show heating oil stability, dispersancy, and corrosion performance can be significantly improved in the bench tests by the appropriate application of additive technology. The improvements in fuel stability and corrosion are studied as a function of the additive treat rate. The beneficial effects of improved fuel oil stability and dispersancy on unscheduled maintenance are discussed. Improved fuel stability reduces sludge formation. Improved dispersancy reduces the agglomeration of particulates. In unison, these improvements in fuel performance should act to reduce the incidence of plugged nozzles, filters, and screens in heating equipment. This results in improved customer satisfaction and reduced unscheduled maintenance costs. Further work is ongoing in conjunction with the test-market introduction of an improved stability, dispersancy, corrosion, and detergency heating oil to determine its impact on burner operation and maintenance requirements.

7956 (BNL–52430, pp. 131-146) **Design study for advanced flame quality indicator.** Posillico, T. (Brookhaven National Lab., Upton, NY (United States)). Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the 1994 oil heat technology conference and workshop.* 216p. Order Number DE95003023. Source: OSTI; NTIS; GPO Dep.

This paper will discuss the research done at Brookhaven National Laboratory (BNL) in support of identifying and evaluating options for an advanced multicolor Flame Quality Indicator (FQI) system. Advantages over the current FQI design are described, including obtaining a universal setpoint that is independent of firing rate and combustion chamber configuration. Various designs will be explored, specifically a fully integrated arrangement that can be used with an automatic excess air control system and/or a portable service tool version. The paper will also summarize optical measurements of burner flames made with BNL's Optical Multichannel Analyzer (OMA) system and recommend and describe hardware,

mounting, and cost options for a prototype advanced FQI system design.

7957 (BNL–52430, pp. 147-156) **Results of the validation of the oil heat vent analysis program (OHVAP).** Strasser, J. (Brookhaven National Lab., Upton, NY (United States)); Krajewski, R.F. Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the 1994 oil heat technology conference and workshop.* 216p. Order Number DE95003023. Source: OSTI; NTIS; GPO Dep.

This paper presents relevant background information and the preliminary validation results for the Oil Heat Vent Analysis Program (OHVAP). The program's calculations are presented in graphical form and compared with experimental data. The OHVAP results are also compared with results obtained using a steady state analysis.

7958 (BNL–52430, pp. 157-168) **Development of oil heat chimney venting tables.** Krajewski, R.F. (Brookhaven National Lab., Upton, NY (United States)). Brookhaven National Lab., Upton, NY (United States). Apr 1994. (CONF-940376–: Oil heat technology conference and workshop, Upton, NY (United States), 24-25 Mar 1994). In *Proceedings of the 1994 oil heat technology conference and workshop.* 216p. Order Number DE95003023. Source: OSTI; NTIS; GPO Dep.

This paper presents an overview of the groundwork which is underway in developing a set of rational guidelines in the form of venting tables for the installation of chimney vent systems for mid- and high-efficiency oil-fired heating appliances. The development of a prescriptive format for the tables is considered essential in terms of maintaining an ease of choice for the installer both in the sense of physical geometry and in cost estimates for the system. A set of "straw-man" chimney venting tables have been generated using a steady-state (non-transient) computer program. This was done in order to present an appropriate format, with approximate projections of chimney vent behavior for industry consideration. The assumptions used in the calculations and examples of the computed results are presented. An example of a completed table is shown together with a discussion of the rational for particular vent geometry choices.

7959 (BNL–60978) **Measurement of thermal regain in duct systems located in partially conditioned buffer spaces. Informal report.** Andrews, J.W. Brookhaven National Lab., Upton, NY (United States). Jul 1994. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95004839. Source: OSTI; NTIS; GPO Dep.

Thermal losses from duct systems have been shown to be a significant fraction of the heat or cooling energy delivered by the space-conditioning equipment. However, when the ducts are located in a partially conditioned buffer space such as a basement, a portion of these losses are effectively regained through system interactions with the building. This paper presents two methods of measuring this regain effect. One is based on the relative thermal resistances between the conditioned space and the buffer space, on the one hand, and between the buffer space and the outside, on the other. The second method is based on a measured drop in the buffer-space temperature when steps are taken to reduce the duct losses. The second method is compared with results of an extensive research project that are published in a major professional society handbook. The thermal regain fraction using the drop in basement temperature was found to be 0.68, while that obtained from an analysis of the system performance data, without using the basement temperature, was 0.59.

7960 (DOE/BP–2458) **Field measurements of heating efficiency of electric forced-air furnaces in six manufactured homes.** Davis, B.; Palmiter, L.; Siegel, J. Ecotope, Inc., Seattle, WA (United States). 26 Jul 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AM79-91BP13330. Order Number DE95004887. Source: OSTI; NTIS; GPO Dep.

This report presents the results of field measurements of heating efficiency for six manufactured homes in the Pacific Northwest heated with electric forced-air systems. This is the first in a series of regional and national efforts to measure in detail the heating efficiency of manufactured homes. Only six homes were included in this study because of budgetary constraints; therefore this is not a representative sample. These investigations do provide some useful information on the heating efficiency of these homes. Useful comparisons can be drawn between these study homes and site-built heating efficiencies measured with a similar protocol. The protocol used to test these homes is very similar to another Ecotope protocol used in the study conducted in 1992 and 1993 for the Bonneville Power Administration to test the heating efficiency of 24 homes. This protocol combined real-time power measurements of furnace energy usage with energy usage during co-heat periods. Accessory data such as house and duct tightness measurements and tracer gas measurements were used to describe these homes and their heating system efficiency. Ensuring that manufactured housing is constructed in an energy and resource efficient manner is of increasing concern to manufactured home builders and consumers. No comparable work has been done to measure the heating system efficiency of MCS manufactured homes, although some co-heat tests have been performed on manufactured homes heated with natural gas to validate HUD thermal standards. It is expected that later in 1994 more research of this kind will be conducted, and perhaps a less costly and less time-consuming method for testing efficiencies will be develops.

7961 (DOE/CE/21009–T1) **Turning research into results, final report.** ACEC Research and Management Foundation, Washington, DC (United States). May 1993. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-90CE21009. Order Number DE95005456. Source: OSTI; NTIS; GPO Dep.

Includes booklet, "An Introduction to Energy Efficient Technologies for Existing Buildings for Building Owners and Managers," November 1992.

In September 1989, the ACEC Research and Management Foundation (ACEC/RMF) submitted a proposal to the US Department of Energy (DOE) in response to the Existing Buildings Efficiency Program's Solicitation Number DE-PS01-89CE21034. On May 15, 1990, DOE informed ACEC/RMF that it had been selected for a grant award; the final agreement was signed on July 23, 1990. The purpose of the effort was to develop an information package showing engineering firms that energy services can be sold to owners and developers successfully and profitably, that not every design that goes beyond code results in a lawsuit, that owners can be shown the value of paying for the additional design analysis that energy efficiency design requires. The package was envisioned to include examples of buildings that succeed in terms of energy, cost, and design team benefits. It was further conceptualized as both a technical and marketing resource to provide helpful facts, references to relevant documents, graphic materials to be used during client presentations, and guidance on the latest in useful research results.

7962 (DOE/CE/23810–48C) **Sealed tube comparisons of the compatibility of desiccants with refrigerants and lubricants. Quarterly technical progress report, July 1994–September 1994.** Field, J.E. (Spauschus Associates, Inc., Stockbridge, GA (United States)). Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States); Spauschus Associates, Inc., Stockbridge, GA (United States). Oct 1994. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE95005666. Source: OSTI; NTIS; GPO Dep.

Continuing environmental concerns mandate replacement of CFC's with alternate refrigeration fluids. At this time relatively little testing has been reported in the literature for compatibility of desiccants in these new working fluids. Using bench scale test methods generally accepted throughout the industry today, this work will provide data necessary to assess the compatibility of virtually all of the currently used desiccant types – both bead and molded core, with thirteen refrigerant/lubricant combinations. The desiccants are tested by exposure to refrigerant and lubricant in–1989. After aging, the liquid phase is evaluated for acid anion formation, change in color, and presence of halide ions, the gas phase is analyzed for refrigerant decomposition by gas chromatography, and the desiccants are evaluated for changes in crush strength and for retention of acids and halide ions. Metal catalysts, also present in the sealed

tubes, are visually examined for corrosion, copper plating, and appearance changes.

7963 (DOE/EE–0025) **Windows and daylighting: A brighter outlook.** USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). Nov 1994. 15p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95007021. Source: OSTI; NTIS; GPO Dep.

This is an overview of energy efficient window glazing and framing technology. The topics of the report include: windows and energy use, a point of view; a challenging federal opportunity; DOE window research; advanced optical technologies such as spectrally selective glazing, switchable glazing, super windows with low-emissivity coatings and noble gas fills; and performance evaluation and design tools.

7964 (KE–93003B) **A study on the performance evaluation technique of prefabricated Ondol(II).** Hong, S.H. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Min, J.H.; Yoon, Y.J.; Cho, S. No corporate text available. Dec 1993. 98p. (In Korean). Order Number DE95744291. Source: OSTI; NTIS (US Sales Only).

The measuring equipments for thermal performance of the prefabricated Ondol panel using hot water was developed and the performance evaluation techniques of the Ondol panel heating system was improved. Indoor thermal environment was predicted using the simulation program to verify the applicability of the prefabricated Ondol panel. In order to analyze the actual conditions energy transmission system, some examples of the United States and Germany were investigated and the characteristics of several methods of energy transmission were surveyed. (author). refs., figs., tabs.

7965 (KE–93004B) **Study on the hydrogen production and cathodic protection using photovoltaic systems.** Kim, B.H. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Park, Y.J.; Jung, M.W.; Kim, H.W. No corporate text available. Dec 1993. 203p. (In Korean). Order Number DE95744267. Source: OSTI; NTIS (US Sales Only).

This paper is studied on the potential variation of electrode against environment conditions, soil resistivity and electrode resistance for cathodic protection. Base on this analysis, the following results for designing PV powered cathodic protection are obtained. (1) Select an anode and groundbed with low internal resistance. For the underground applications, a graphite anode surrounded by metallurgical coke breeze is appropriate. For underwater or wetter applications, conductive EPDM rubber may be more suitable than platinum. (2) If anode replacement is not a problem, consider the use of magnesium or zinc for the goundbed anode. (3) Use multiple anodes connected in parallel to minimize anode resistance (4) Install underground anodes so that stay moist as long as possible reduction is system performance over time and a possible increase in the cathodic protection current requirement. (author). refs., figs., tabs.

7966 (KE–93004G) **Standardization of direct and global solar radiation in Korea (II).** Jeon, H.S. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Cho, S.H.; Oh, J.M.; Kim, E.I.; Jo, D.K.; Lee, T.K.; Kim, D.H.; Lee, S.M.; Jun, I.S. No corporate text available. Dec 1993. 354p. (In Korean). Order Number DE95744273. Source: OSTI; NTIS (US Sales Only).

The objective of this project is preparation of engineering data to help meet the needs of industry, engineers, researchers and government for solar radiation data, models, and assessments, as required to develop, design, deploy, and operate energy conversion and solar energy conversion systems. The specific goals of this work can be classified as follows (1) Collection and assessment of insolation data through 16 site network (2) Error analysis of measured insolation data (3) Calibration technique for measurement device sensibility (4) Analysis of regional insolation components (5) Evaluation of insolation components in high altitude. (author). refs., figs., tabs.

7967 (KE–93005B) **A study on retrofit measures of KIER buildings for energy conservation.** Park, H.S. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Yoo, H.H.; Chang, H.J.; Chang, M.S. No corporate text available. Mar 1994. 309p. (In Korean). Order Number DE95744290. Source: OSTI; NTIS (US Sales Only).

Buildings of KIER that were constructed in 1980 consume much energy, because of outworn equipments(boiler, refrigerator, fan coil unit, piping) and windows facing to the west of main research building and irrational operation of H.V.A.C system. The purpose of this study is to present retrofit measures for the improvement of energy performance and indoor environment on KIER building by investigation and testing actual living conditions. From these results, we obtained 27.6% energy saving of heating and cooling load in KIER building. (author). refs., figs., tabs.

7968 (KE–93005S) **Development of Direct Contact Heat Exchangers for solar energy utilization (III).** Kang, Y.H. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Jeon, M.S.; Yoon, H.K.; Kwak, H.Y.; Lee, N.H.; Yoon, J.H.; Yoo, C.K.; Lim, S.H.; Chun, W.G.; Won, S.H.; Kim, J.B.; Kim, N.J. No corporate text available. Oct 1994. 131p. (In Korean). Order Number DE95744270. Source: OSTI; NTIS (US Sales Only).

The Direct Contact Heat Exchanger(DCHX) has been widely studied in the chemical industry for many years due to its inherent simplicity as a counter-current device for heat and mass transfer. The use of a Direct Contact Heat Exchanger, if properly applied, will allow several benefits. Primarily these include the elimination of the cost of a closed heat exhanger and the ability to operate with much lower temperature differences. Systems using Direct Contact Heat Exchangers are quite similar to Systems using indirect heat exchangers in many respects. In these systems, the DCHX unit can be combined with the thermal storage unit, or alternatively, it can be used separately from the storage unit, much like an external (to storage) closed heat exchanger system. Hence, either the DCHX system or the closed heat exchanger system can operate with the same number of pumps/loops. Some flow directions may be different between the two types of systems, depending upon the fluids used in the DCHX system. This is because the DCHX generally relies upon the force of gravity ot accomplish the fluid flow within the device. In the present work, the spray column type of direct contact heat exchangers are studied extensively to harness the solar energy for spaced heating. To carry out the flow analysis of working fluid in the spray column, numerical simulations are carried out extensively with the axi-symetric 2-dimensional two fluid model. In the simulation results, operation conditions have to be controlled to have a wide injection area, injection hole and small flow rate in the injection part to obtain uniform velocity distribution for maximum heat transfer in the main part of spray column. Some of the major considerations that are involved in the design of heat exchangers in this study are that; working fluid is a hydrocarbon (such as Texaterm) or water which is either lighter or heavier than storage medium.

7969 (KE–93006S) **Development of the high performance phase change heat transfer system(II).** Yang, Y.S. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Lee, D.W.; Yoon, E.S.; Ju, M.C. No corporate text available. Nov 1994. 103p. (In Korean). Order Number DE95744266. Source: OSTI; NTIS (US Sales Only).

Experimental study on the closed two-phase thermosyphon loop system using the F-113 were performed. The results showed that the heat transfer efficiency was raising in accordance with increasing of the temperature difference between heat source and heat sink. And it showed that the pertinent fluid charge also existed. It can be also found that the relation between the loop pressure and the heater exit temperature is available to find the datum point which can decide the performance of a system. (author). refs., figs., tabs.

7970 (KE–93008S) **Development of high efficient process for simultaneous removal of SOx and NOx from flue gas (III).** Lee, H.K. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Kim, C.H.; Choi, I.S.; Kim, Y.I.; Min, B.M.; Park, S.D.; Choi, W.K.; Bak, I.H.; Kim, J.G.; Cho, H.D.; Lee, J.S.; Kim, S.U.; Lee, W.S. No corporate text available. Oct 1994. 191p. (In Korean). Order Number DE95744279. Source: OSTI; NTIS (US Sales Only).

The object of this research is to develop the simultaneous SOx and NOx removal process from flue gases using limestone and P4

additive. The research results are as follows; 1. Phosphorus oxy acids produced by reaction of P4 and O2 were PO43-, PO33-, and PO23-, and ion concentration distribution in the reactor solution was more than 50% PO43-, less than 50% of PO33- and small amount of PO23-. Total ion concentration in both a reactor and washing column was PO43- of 77%, PO33- of 12.9% and PO23- of 10.1%. The byproduct produced from the oxidation of P4 was recovered as a phosphoric acid up to 98% using one washing column. 2. The effects of L/G, pH, inlet SO_2 concentration were tested by long term experiments in the mini-pilot scale system. The measured change in SO_2 pickup was a linear function of the inlet SO_2 concentration over the range of SO_2 concentrations tested. 3. The increase of P4 concentration from 0.1 to 0.5 w/w% increased the P/NO mole ratio from 2.0 to 4.2 and consumption rate of limestone increased linearly in the mini-pilot scale system. The increase of inlet NO concentration from 270 ppm to 750 ppm decreased the P /NO ratio from 3.2 to 2.0. As the L/G ratio increased from 47.4 to 67.5, the maximum removal efficiency of NO was increased from 71.9 to 89.6%, and P/NO ratio was decreased from 3.2 to 2.2 in the mini-pilot scale system. 4. Sulfite oxidation reaction was investigated to use the byproduct in the lab-scale apparatus. When we keep the reaction order of 1.5, the rate constants were 3.19 x 10-4, and 8.95 x 10-4 when the pH were 4.5 and 9.5, respectively. The catalytic activity of Mn_2^+ was much higher than that of Mg_2^+ even though the concentration of Mn_2^+ was lower than Mg_2^+. (author). refs., figs., tabs.

7971 (KE–93010S) **Development of industrial waste heat recovery system using chemical heat pump with NH_3-salt(I).** Choi, I.S. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Kim, Y.I.; Kim, C.H.; Min, B.M.; Choi, W.K.; Bak, I.H.; Kim, J.G.; Lee, J.S. No corporate text available. Mar 1994. 134p. (In Korean). Order Number DE95744277. Source: OSTI; NTIS (US Sales Only).

The objective of this research is to develop industrial waste heat recovery system using chemical heat pump with adopt NH_3-salt as a medium. Generally, the chemical heat pump is more efficient than compression type heat pump. Furthermore, it is one of the system which doesn't use any CFCs whose productions and uses are scheduled to be phased out worldwide by Montreal Protocol. Therefore, the chemical heat pump will be expected as the heat pump for next generation. The use of this chemical heat pump system to utilize the industrial waste heat will also save huge amount of energy available. The final object of this study is to design the chemical heat pump utilize the industrial waste heat using STELF process. The first year research was accomplished the basic literature survey for chemical heat pump and steady state simulation (level 0 design). Also, the batch type STELF system whose capacity is 1 kw(storage time:1 hr) was designed to use level 0 design program. (author). refs., figs., tabs.

7972 (KE–93011G) **Study on the environment of passive solar schoolrooms (II).** Lim, S.H. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Chun, W.G.; Yoon, J.H.; Lee, N.H.; Won, S.H.; Kang, Y.H.; Jeon, M.S.; Yu, C.K.; Yun, H.K.; Kwak, H.Y.; Boo, J.H. No corporate text available. Dec 1993. 107p. (In Korean). Order Number DE95744272. Source: OSTI; NTIS (US Sales Only).

The present study has investigated various problems with the classroom in the existing elementary and (junior) high school buildings from the point of indoor environment, and made some suggestions for possible solutions. Following the oil crisis in 1979, there have been surge of movements by the government in Korea to conserve petroleum-based energy in every sector of society. One of these movements was the application of passive solar technologies into the construction of school buildings. Various passive designs are developed paying special regard to architectural and climatic factors. Apart from the configurations of 1980 and 1982, the passive design proposed by KIER in 1987 locates the hallway on the south side of the building so that it could be used as an attached sun space for each classroom. Temperature variations of the interior(classroom and corridor) are simulated with a well-known numerical procedure for three different classroom models aforementioned. The conventional school building design, which locates the hallway on the north side of the classroom, has proven to be very ineffective for indoor light control. Especially, glares and dark spots on the work plane as well as nonuniform illuminance on the chalk board were causing undesirable visual effects for the students. The present study has revealed that the thermal performance of the 1987 model with attached sun space could become most efficient, which is yet to be verified by actual measurements. To carry out numerical analysis, the Eulerian method is used with some restrictions on the time step. Especially, the solutions of the 1982 model with iron plate have shown sensitiveness with time steps. The simulated results obtained are based on the physical properties given in ASHRAE Handbook. (author). refs., figs., tabs.

7973 (KE–93013B) **Development of processing technique for the electrochromic window.** Kim, D.H. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Cho, S.H.; Lee, T.K.; Chun, W.G.; Jeon, M.S. No corporate text available. Dec 1993. 91p. (In Korean). Order Number DE95744274. Source: OSTI; NTIS (US Sales Only).

The electrical load for the comfortable indoor atmosphere has increased. Currently, windows have poor energy management properties. These problems could be solved by the development of adjustable optical shutter so called electrochromic windows. The electrochromism is a reversible color change in a material caused by an applied electric field or current. The electrochromic materials can be applied to the field of the electronic information display and micro battery. However, studies concerned this topic has been ignored as compared to the some advanced countries. It is important to develop the material itself and its processing technique. The final goal of the basic research is the development of processing technique and test for the electrochromic window for the efficient utilization of the solar energy. That is, the feasibility of the electrochromic materials was investigated and the processes and its capability was developed in this research. There has been various techniques for the thin film processes. The researches related to the application for the electrochromic window has been neglected and somewhat theoretical from the view point of energy savings. The various processes were applied to make thin films, which were compared with respect to its durability, reproducibility and economic aspects. Three different electrochromic materials for different thin film processes are involved in the present study. W03 thin film from RF sputtering method was light blue and transparent. The anodically formed NiO showed dark brown color but experienced aging effect. The sol-gel dipping process for TiO_2 thin film was successful to obtain uniform anatase phase, but electrochromic property was not displayed mainly due to the improper electrolyte and electrode. The feasibility of thin film processing for electrochromic window has been established by the experimental results. (author). refs., figs., tabs.

7974 (KE–93014G) **A study on energy conservation in heat source distribution system(II).** Tae, C.S. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Park, S.D.; Seo, H.S.; Shin, K.S.; Yoo, S.S. No corporate text available. Dec 1993. 180p. (In Korean). Order Number DE95744289. Source: OSTI; NTIS (US Sales Only).

The objective of this study is reduce the energy consumption for heat source distribution in HVAC systems. We carry out the investigate about building energy reduction method in heat source distribution system and the present tendency of decentralized HVAC systems and equipments. And develop the building energy analysis program to calculate the energy consumption precisely in heat source distribution system. We prepare the sample designs which adoped natural circulation of refregerant and calculate the energy consumption for each sample design. (author). refs., figs., tabs.

7975 (KE–93020G) **A Study on energy oriented intelligent building system(II) - development of emulator/tester.** Seo, H.S. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Park, S.D.; Shin, K.S.; Tae, C.S.; Yoo, S.S. No corporate text available. Dec 1993. 110p. (In Korean). Order Number DE95744292. Source: OSTI; NTIS (US Sales Only).

EIBS which controls the HVAC systems is one portion of Intelligent Building in buildings. Its performance is directly related to the amount of energy consumed in a building and the comfort of the building occupants. One approach to evaluate the performance of

an EIBS is through the use of an Emulator. This is a special computer/data acquisition system that is connected to the sensor inputs and command outputs of the EIBS. It replaces the HVAC system and building and use a computer program to simulate their response to EIBS commands. This report contains guidelines to design the emulator and present its design example. (author). refs., figs., tabs.

7976 (KE–93027G) **A study on the energy database establishment.** Oh, C.S. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Shin, H.S.; Lee, B.S.; Jung, C.Y.; Kim, D.S.; Bae, L.H. No corporate text available. Dec 1993. 124p. (In Korean). Order Number DE95744276. Source: OSTI; NTIS (US Sales Only).

This energy database has been designed and built to cover subjects scope of energy related scientific and technical information. The information sources include journal articles, research reports, conference literature, patents, and energy related statistics. And the automatic indexing system for energy literature is developed for selecting proper index terms in Korean literatures. (author). refs., figs., tabs.

7977 (KE–93032G) **Efficiency evaluation and plan for extensive use of newly developed energy saving products- OA equipment energy saver and vehicle fuel economizer.** Shin, H.S. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Kwon, C.H.; Lee, Y.J.; Ko, C.J.; Kim, J.P.; Lee, B.S.; Kim, D.S.; Lee, S.G.; Hong, J.C.; Kim, B.S.; Kwon, O.S.; Bae, L.H. No corporate text available. Dec 1993. 161p. (In Korean). Order Number DE95744275. Source: OSTI; NTIS (US Sales Only).

PC-electricity saver was effective and reliable, but it was not economical yet. Since the price of these devices are so expensive comparing with electricity saving. The pay-back period was calculated 9 to 15 years roughly. Chassis dynamometer tests show the fuel economy changes between 1.8% deterioration to 1.8% improvement, and monitoring tests show little changes in vehicle performance with these devices. Finally, it was concluded that there are little effects of the vehicle fuel economizers on vehicle fuel economy in the present test results. (author). refs., figs., tabs.

7978 (KE–93033G) **A study on the optimum operation methodology of small hydro power plants(I).** Lee, C.H. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Park, W.S.; Choi, C.J.; Yoo, S.W. No corporate text available. Dec 1993. 113p. (In Korean). Order Number DE95744268. Source: OSTI; NTIS (US Sales Only).

Precise analysis of the performance characteristics for small hydro power plants must be carefully considered to develop hydro power resources effectively. In order to achieve this objective, the performance characteristics of two existing small hydro power plants located in Han-river system and Keum-river system were analyzed. Also, based on the results analyzed from this study, rational operation methods were suggested. The performance characteristics such as annual average load factor and annual average electricity production were analyzed by using performance prediction model developed for two existing small hydro power plants located in Han-river system and Keum-river system. Also, the hydrological characteristics such as flow discharge - water level relation and rainfall - flow discharge relation were analyzed. And the rational operation method of small hydro power plants was suggested by analyzing operation records. (author). refs., figs., tabs.

7979 (KE–93034G) **Detailed survey of wind energy on Cheju Province for the feasibility study of wind farm(II).** Park, K.H. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Kim, K.H.; Yoo, S.W. No corporate text available. Dec 1993. 230p. (In Korean). Order Number DE95744269. Source: OSTI; NTIS (US Sales Only).

To obtain the feasibility result of wind farm in our country, first of all, the detailed survey of wind energy on Cheju Province which is known as the area of abundant wind energy, but more electricity supply is needed because of rapidly increasing electricity consumption, was carried out. The contents of this report are summarized as follows; - Survey of wind energy utilization and wind energy analysis technique - Analysis of wind energy characteristics in Cheju Province - Development of wind energy analysis program This program provides 13 summarized analysis result and 34 detailed analysis result. And for the convenient understanding of wind energy characteristics, the graphic program was developed which enables to display the graph drawing in the monitor. (author). refs., figs., tabs.

7980 (KTM/E-D–202) **Heat cost allocation in Finland.** Kimari, R. Ministry of Trade and Industry, Helsinki (Finland). Energy Dept. 1994. 124p. (In Finnish). Project KTM-TERMO-3.8. Order Number DE95737598. Source: OSTI; NTIS.

TERMO - District heating research programme.

This study examines the possibilities to share the heating costs in a fair way in dwellings equipped with water circulated central heating. This study presents the most common principles of heat cost allocation, the legislation and commercial equipment used in Central Europe. It is clear that heat cost allocation, information and higher prices decrease the consumption, but the references used in the study could not prove exactly, how great an influence the heat cost allocation has on the heat consumption. Not all the cheapest methods of heat cost allocation will work with a proper accuracy in those low temperature levels used typically in Finnish buildings. None of the radiators installed before 1994 have been tested in laboratory according to the standards. The fair allocation of heating costs requires compensation of different location and direction of the dwellings and also heat transmission between the dwellings at different indoor temperatures. The systems which can take those factors into account are far too expensive for profitable metering (orig.)

7981 (LBL–34638) **The design and evaluation of integrated envelope and lighting control strategies for commercial buildings.** Lee, E.S.; Selkowitz, S.E. Lawrence Berkeley Lab., CA (United States). Jun 1994. 18p. Sponsored by USDOE, Washington, DC (United States);California Inst. for Energy Efficiency, Berkeley, CA (United States). DOE Contract AC03-76SF00098. (CONF-950104–3: American Society of Heating, Refrigerating and Air-Conditioning Engineers winter meeting and exhibition, Chicago, IL (United States), 28 Jan - 1 feb 1995). Order Number DE95004676. Source: OSTI; NTIS; GPO Dep.

This study investigates control strategies for coordinating the variable solar-optical properties of a dynamic building envelope system with a daylight controlled electric lighting system to reduce electricity consumption and increase comfort in the perimeter zone of commercial buildings. Control strategy design can be based on either simple, instantaneous measured data, or on complex, predictive algorithms that estimate the energy consumption for a selected operating state of the dynamic envelope and lighting system. The potential benefits of optimizing the operation of a dynamic envelope and lighting system are (1) significant reductions in electrical energy end-uses - lighting, and cooling due to solar and lighting heat gains - over that achieved by conventional static envelope and lighting systems, (2) significant reductions in peak demand, and (3) increased occupant visual and thermal comfort. The DOE-2 building energy simulation program was used to model two dynamic envelope and lighting systems, an automated venetian blind and an electrochromic glazing system, and their control strategies under a range of building conditions. The energy performance of simple control strategies are compared to the optimum performance of a theoretical envelope and lighting system to determine the maximum potential benefit of using more complex, predictive control algorithms. Results indicate that (1) predictive control algorithms may significantly increase the energy-efficiency of systems with non-optimal solar-optical properties such as the automated venetian blind, and (2) simpler, non-predictive control strategies may suffice for more advanced envelope systems 1 incorporating spectrally selective, narrow-band electrochromic coatings.

7982 (LBL–35982) **Evaluation of advanced technologies for residential appliances and residential and commercial lighting.** Turiel, I.; Atkinson, B.; Boghosian, S.; Chan, P.; Jennings, J.; Lutz, J.; McMahon, J.; Rosenquist, G. Lawrence Berkeley Lab., CA (United States). Jan 1995. 153p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95006720. Source: OSTI; NTIS; GPO Dep.

Section 127 of the Energy Policy Act requires that the Department of Energy (DOE) prepare a report to Congress on the

potential for the development and commercialization of appliances that substantially exceed the present federal or state efficiency standards. Candidate high-efficiency appliances must meet several criteria including: the potential exists for substantial improvement (beyond the minimum established in law) of the appliance's energy efficiency; electric, water, or gas utilities are prepared to support and promote the commercialization of such appliances; manufacturers are unlikely to undertake development and commercialization of such appliances on their own, or development and production would be substantially accelerated by support to manufacturers. This report describes options to improve the efficiency of residential appliances, including water heaters, clothes washers and dryers, refrigerator/freezers, dishwashers, space heating and cooling devices, as well as residential and commercial lighting products. Data from this report (particularly Appendix 1)were used to prepare the report to Congress mentioned previously. For the residential sector, national energy savings are calculated using the LBL Residential Energy Model. This model projects the number of households and appliance saturations over time. First, end-use consumption is calculated for a base case where models that only meet the standard replace existing models as these reach the end of their lifetime. Second, models with efficiencies equal to the technology under consideration replace existing models that reach the end of their lifetime. For the commercial sector, the COMMEND model was utilized to project national energy savings from new technologies. In this report, energy savings are shown for the period 1988 to 2015.

7983 (LUTADL-TABK–1004) **Tracer gas measurement techniques. Active methods to identify volumes, air flows, flow paths and flow patterns in single family houses.** Hedin, B. Lund Univ. (Sweden). Dept of Building Technology. Nov 1994. 269p. (In Swedish). Project BFR-930300. Order Number DE95737668. Source: OSTI; NTIS.

Also available from: Lunds Univ., Dept. of Building Technology, P.O. Box 118, S-221 00 LUND, Sweden.

This thesis Deals with two different models for the description of a flow system and methods for the identification of these models using tracer gas measurements. The methods have been tested in extensive experiments in four single family houses. The idealized multi zone model - which consists of one or more perfectly mixed zones which may be coupled with the flows - has been used to determine air flows and ventilated volumes in single family houses. The most straightforward method of describing a flow system is by its weighting function which expresses the relationship between the injection of tracer gas at one point and the concentration of tracer gas at another points. The main problem in modelling by using the weighting function is that the present method does not include infiltration in the calculations, but regards it as a residual item. Field measurements show that the tracer gas methods used provide valuable knowledge of how the ventilation system in a single family house works. Nor it is possible to acquire this knowledge without tracer gas measurements. However, one essential limitation of the tracer gas method is that it is a tool which described only the present situation. It is difficult to generalize the results to cover that happens when conditions change, e.g. when the house is made more airtight, when ventilation is run at a higher speed or when a window is opened. On the other hand. measurements made in houses of the same type and similar conditions exhibit almost identical results. This is encouraging and indicated that results measured in one house can be generalised to other similar houses. It should therefore be possible for a house producer, for instance on the basis of measurements in a reference house, to draw general conclusions regarding all houses of the same type. Numerous figs and tabs

7984 (NBI-PR–160-1994) **Reasonably-priced low energy houses - heat recovery. New, simple system for residential ventilation.** Gundersen, P. Norges Byggforskningsinstitutt, Oslo (Norway). Jun 1994. 72p. (In Norwegian). Order Number DE95737645. Source: OSTI; NTIS.

The report deals with an energy saving and cost effective ventilation plant which is an important element in the Norwegian project "Reasonably-priced low energy houses". The energy saving measures which are both easy and safe in operation with a minimum of maintenance, are to be integrated into the building structure in the planning phase. The plant is equipped with a noise reducer, and a system design for the operation control, is shown. The report shows the alternative methods of plant design, which include the location of an heat exchanger and a system of soil-covered pipes. A cost quotation for the plant is given. A new project with the aim of developing a ventilation aggregate with natural circulation, is briefly dealt with. 4 refs., 24 figs., 5 tabs.

7985 (NEI-DK–1796) **Daylighting in business buildings. State report.** Dansk Teknologisk Inst., Taastrup (Denmark); Esbensen Raadgivende Ingenioerer, Soenderborg (Denmark); Statens Byggeforskningsinstitut, Hoersholm (Denmark). Afd. for Energi og Indeklima. 1994. 43p. (In Danish). Contract ENS-1213/91-0010. Order Number DE95737563. Source: OSTI; NTIS.
EFP-91.

The purpose of this report is to summarize the Danish and foreign experience in daylighting in business buildings and to create appropriate technologies in order to improve the lighting, save energy and provide a better visual comfort in the existing and future buildings. In this connection the report deals with side-sources of light like atria, but not with roof-window lighting. Each topic is characterized by its present stage, trends and needs of the Danish research contribution. This report forms part of the project 'Energy optimization of business buildings - Utilization of the daylight and minimization of the electric lighting'. (EG) (87 refs.)

7986 (NYSERDA–94-19) **Energy use and domestic hot water consumption - Phase 1. Final report.** Goldner, F.S. (Energy Management & Research Associates, Brooklyn, NY (United States)). New York State Energy Research and Development Authority, New York, NY (United States); Energy Management and Research Associates, Brooklyn, NY (United States). Nov 1994. 64p. Sponsored by New York State Energy Research and Development Authority, Albany, NY (United States). Source: OSTI; New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223.

New York State Energy Research & Development Authority has sponsored a project to develop comprehensive operating data on combined domestic hot water (DHW) and heating systems to be used in system design and specifications. The new, more precise DHW flow data (broken down on a per capita basis) result in a better foundation for sizing decisions. Thirty New York City multifamily buildings with combined steam heating and DHW plants were instrumented to monitor apartment, outdoor, boiler and DHW temperatures, and burner on-off times. In nine buildings, which had been upgraded, additional data collected were: stack temperature, DHW flow in 15-minute increments, oil and boiler make-up water flows, and DHW temperature before and after the mixing valve and on the return line. The data set collected for 14 months amounts to a data base of over 110 megabytes. This report presents DHW demand patterns, seasonal variations, weekday vs. weekend consumption, consumption vs. occupancy levels, coincidence of 15-, 60-, 120-, and 180- minute demand periods, and average vs. peak demand levels, as well as figures for energy to generate DHW. The format of guidelines presented in this report differs from those currently in use. The "Low - Medium - High" (LMH) users set of guidelines provide a range, rather than a specific, singular gallonage standard. By providing LMH tables and guidelines for their application the design engineer or contractor can then use these as a tool from which to select the appropriate level that matches the site being served. Values are presented for both New York sizing guidelines (developed from this study), as well as a set of 'National' figures (derived from a compilation of studies conducted in other cities). The LMH approach and 'National' guidelines were adopted for inclusion in the 1995 ASHRAE Handbook revision.

7987 (ORNL–6805, pp. 87-91) **Possible future directions for extruded polystyrene foam insulation.** Abbott, J.G.; Minsker, J.H. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Extruded polystyrene foam has been used as an insulation product for several decades. Over that time, the volume of product sold

and the number of manufacturers around the globe has increased dramatically. Because of the relatively high capital requirements for such a plant, the technology of extruded foam manufacture for boardstock, unlike many other foam types, has developed primarily through proprietary processes. This has limited the amount of information available regarding process details and future developments. Nonetheless, some general information is available.

7988 (ORNL–6805, pp. 93-99) **Swiss Eco Refrigerator Project.** Nipkow, J. (ARENA, Zuerich (Switzerland)). Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

The Swiss "Eco Refrigerator" project was initiated by BUWAL and a group of experts who have been closely involved in the problem of CFCs for a long time. The project is sponsored by the Federal Office for Environment, Forests and Landscape (BUWAL). The project group comprises, besides BUWAL, the Energy Systems Laboratory of the Federal Institute of Technology (ETH), Zurich, the Laboratory for Thermodynamics and Refrigeration Technology of the New Buchs Technical College (NTB), and Greenpeace Switzerland. Project management is at IET energy consultants. The goal of the project is to develop and produce some refrigerator/freezer prototypes with respect to later series manufacturing, which should achieve better energy efficiency and reduced environmental impacts.

7989 (ORNL–6805, pp. 101-114) **The MBB-Vacuum Super Insulation (VSI).** Schilf, L. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Vacuum Super Insulations represents the state of the art for very effective insulations for the purpose of thermal control of space crafts and also for specific terrestric applications like cryogenics. The principle of all of these vacuum super insulations is the following: To prevent for instance the solar radiation from a satellite structure heat shields of reflecting foils are used which are separated by filament nets.

7990 (ORNL–6805, pp. 115-119) **Development of evacuated panel thermal insulations.** Caps, R. (Bayerisches Zentrum fuer Angewandte Energieforschung e.V., Wuerzburg (Germany)); Fricke, J. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Conventional insulations like rock wool or glass fiber boards have typical thermal conductivities in the range 0.03 W/mK to 0.04 W/mK. Insulations based on fumed silica like Microtherm^{R} have conductivities in air of > 0.02 W/mK. As they are rather expensive, however, they are mainly used for special applications at higher temperatures. Closed cell polyurethane foams, which are blown with environmentally hazardous CFC gases or their chlorine-free substitutes also have conductivities around 0.020 W/mK. Due to diffusion of atmospheric gases into and effusion of the blowing gases out of the closed cell polyurethane foam, this value increases with life time.

7991 (ORNL–6805, pp. 120-129) **Aerogels - a foam alternative.** Herrmann, G.H. (Colorants Research Lab., Ludwigshafen (Germany)); Mielke, M.F.; Ziegler, B.D.; Teich, F. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Aerogels offer a thermal performance unattained by any other class of material. For a long time aerogels have been of little interest for big volume applications such as domestic appliances because of lack of availability, technical barriers and cheap energy prices. They have only become viable for some small scale specialist applications. However, during recent years BASF has successfully embarked on a program to build up a pilot production plant for granular inorganic aerogels (Basogel®) comprising amorphous SiO_2. So, an advanced thermal insulation material can be provided which seems to meet tough future performance and regulatory needs. Big scale industrial processing of the material has proven possible. Growing interest for application of aerogels in the home appliances manufacturers industry (boilers, refrigerators, freezers, ovens, etc.) may be expected, as excellent quality of aerogel fillings bring remarkable 20% improvement over conventional foamed insulation systems in terms of energy consumption. Additional optimization could be expected by application of vacuum techniques.

7992 (ORNL–6805, pp. 131-139) **Vacuum Insulation Panels (VIPs).** Reuter, R. (Degussa AG, Hanau (Germany)); Sextl, G. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Degussa has developed silica based Vacuum Insulation Panels (VIPs) that, based on their low thermal conductivity makes it possible to create both non CFC and energy saving insulation materials.

7993 (ORNL–6805, pp. 141-151) **AURA™: A fiberglass based vacuum insulation panel technology.** McGrath, R.D. (Owens-Corning Fiberglas Science and Technology Center, Granville, OH (United States)). Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

AURA insulation is an "evacuated panel insulation" that combines a thermally crafted FIBERGLASS media with a STAINLESS STEEL vacuum envelope to provide unsurpassed thermal insulating performance over a broad range of operating temperatures. The selection of the materials of construction in the first instance was made with full regard not just to the anticipated demands of the targeted applications, but also to the Environmental impact of the total insulating system. Working within those parameters, Owens-Corning's Research & Development effort was characterized by a pronounced bias towards an arrangement that would result in an insulation product with excellent longevity of performance (particularly retained thermal performance), ease of recyclability, durability, and a wide operating temperature band.

7994 (ORNL–6805, pp. 153-162) **Absorption technology.** Alefeld, G. (Bayerisches Zentrum fuer Angewandte Energieforschung e.V., Garching (Germany)); Demmel, S. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

The principles and state of the art for basic absorption cycles for chillers, air conditioners, ice makers, and heat pump applications are discussed. Absorption cycles provide for greater energy efficiency and reduced CO_2 emissions and is as efficient as compression technology. The technical issues that must be addressed are: efficiency, chillers must be usable as heat pumps in winter, chillers must be developed for district cooling applications, and corrosion inhibition. The economics and market and technology outlook for the absorption cycle are briefly discussed.

7995 (ORNL–6805, pp. 163-172) **Gas cooling - a worldwide overview.** Chapman, J.F.; Welsby, P.; Whitman, D.J. Oak

Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Gas has only a small proportion of the air conditioning market worldwide. Cooling equipment is usually electrically powered, although environmentally superior gas alternatives are commercially available or under development. Economic factors in Japan have given gas over 25% of the air conditioning load. In Great Britain, Europe and the USA the market share is considerably lower, although the growth of demand for air conditioning and environmental pressures present market opportunities for gas. This paper reviews the world air conditioning market, current technologies, the environmental advantages of gas cooling, and the gas developments and research in progress.

7996 (ORNL–6805, pp. 173-184) **Cooling and air conditioning with water/zeolite.** Schwarz, J.; Maier-Laxhuber, P.; Woerz, R. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

The natural substances water and zeolite can be combined in an adsorption process for the concurrent production of heating and cooling power and for the efficient storage of thermal energy. Of the large variety of resulting engineering applications three well developed types are described in more detail. The three applications are: an electricity-independent icemaker for which only a small hand-operated vacuum pump is required; an automobile air conditioner which draws its power largely from the hot exhaust gases of the combustion engine and thus can serve to reduce the worldwide green-house effect; and a combination of electric water heater and refrigerator which does not draw additional power for the refrigeration part.

7997 (ORNL–6805, pp. 185-192) **Stirling cycle refrigerators and heat pumps.** Lundqvist, P.G. (Royal Institute of Technology, Stockholm (Sweden)). Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

There are no Stirling machines, engines or refrigerators that operate according to the Ideal Stirling cycle. Still we name these machines after this cycle. The ideal cycle is of course named after the inventors Robert and James Stirling whose machines definitely did not worked according to the ideal cycle. The definition of what kind of machine that is worthy the name Stirling machine has been proposed by several authors.

7998 (ORNL–6805, pp. 193-197) **Thermoacoustic refrigeration and acoustic compression.** Hara, Toshitsugu (Nippon Institute of Technology (Japan)). Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Resonant high amplitude sound produces two significant phenomena; thermoacoustic refrigeration and sonic compression of gas. In this report, experimental studies on thermoacoustic refrigeration recently done in Japan were briefly shown, and a few discussions on acoustic compression refrigerator were also made. Few researchers in Japan have been interested in thermoacoustic refrigeration. Acoustic compressor is supposed not to have been experimented in Japan. Recently not a few designers of refrigeration are gradually interested in the results of experiments of both thermoacoustic refrigeration and acoustic compressors. When we can break through some problems (heat exchangers, valves, drivers and so on), their efficiencies will be expected to be equivalent to conventional compressors.

7999 (ORNL–6805, pp. 199-205) **Water as refrigerant and secondary refrigerant: Technologies for the production of chilled water and ice-slurries.** Paul, J. (Integral Technologie GmbH, Flensburg (Germany)). Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

The increasingly intense discussion about future refrigerants is creating headaches for manufacturers of refrigeration equipment, installers and especially for end-users. Whatever decision is taken today, the result may prove to be wrong at a later stage. There is a threat to many substances and no-one can really forecast the eventual solution.

8000 (ORNL–6805, pp. 207-218) **Outdoor air and groundwater as natural sources for cooling.** Sorensen, S.N. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

The purpose of this paper is to discuss ideas and proposals for cooling without the use of refrigerants as CFC's by the utilization of the natural changes in outdoor air temperature during a day and the uniform temperature of groundwater during the year. The cooling methods mentioned in the paper can be used for air-conditioning, chillers and process cooling at moderate temperatures, but they can not be used to replace freezers and other cooling machinery with evaporation temperature below 0 deg. C. The use of alternative cooling sources as outdoor air and groundwater means at the same time a reduction in the use of refrigerants and a reduction in the electricity consumption in comparison to cooling compressors. As a consequence of the reduction in electricity consumption there will be a reduction in CO_2-emission to the atmosphere in case of power production based on fossil fuels.

8001 (ORNL–6805, pp. 219-224) **High density energy storage for desiccant cooling systems.** Laevemann, E. (Ludwig-Maximilians-Universitaet Muenchen (Germany)); KeBling, W. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

The objective of our development is an open cycle liquid desiccant cooling system designed to provide cooling and dehumidification for air conditioning purposes as well as efficient energy storage within the desiccant (up to 1000 MJ/m^3 of diluted solution). A schematic of the system is shown. Ambient air is dehumidified in a sorption reactor by a concentrated hygroscopic salt solution, e.g., Klimat 3930 or LiCL-H_2O, supplied from a plastic storage tank. The heat of absorption is transferred to a cooling tower by a cooling water loop to achieve an almost isothermal absorption process, required for optimal air dehumidification and optimal energy storage capacity. The salt solution is diluted in the absorption process and pumped to a second tank. The dehumidified air is mixed with indoor air of state, cooled in an indirect evaporative cooler and supplied to the room. A part of the air flow is humidified in contact with a wet heat exchanger surface and provides indirect evaporative cooling. The exhaust air temperature and dewpoint are close to room temperature. A separate operation mode or a separate sorption reactor is used to reconcentrate the salt solution. The heat for regeneration can be supplied via a heating water loop by any heat source of about 65°C or higher.

8002 (ORNL–6805, pp. 263-276) **CFC- and FHC-free refrigerators by FORON Hausgeraete Co. - a breakthrough in household refrigeration.** Meyer, A. Oak Ridge National Lab., TN

(United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Considering the proposed CFC-ban according to the Montreal Protocol, the surge for alternative substances as refrigerants and foaming agents worldwide was begun. Though many companies preferred to use FHC 134a, despite the fact that it is accelerating the "greenhouse effect," FORON chose to use hydrocarbons as an environment saving alternative. The results of extensive tests over many years proved that these natural gases have obvious energy advantages, that their use in the mass production process is rather uncomplicated, and that the security problems concerning inflammable gases can be successfully solved. Since the starting serial production in mid-March over 60,000 completely CFC/FHC-free refrigerators were produced and sold mainly in Germany. Further development work on the improvement of the technology is under way.

8003 (ORNL–6805, pp. 277-288) **The conversion of German household-appliance refrigeration industry from CFC's to hydrocarbons and fluorocarbons in 1993.** Lotz, H. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

On a mass production scale the only substitute for refrigerants usable at the present time is the fluorohydrocarbon R 134a. Secured experience is available from several years of trial use under extreme conditions. R 134a is available on the market in sufficient quantity and purity and so are the ester oils necessary for compressor lubrication. The refrigerant has as well known no depletion effect on the ozone layer and directly contributes a multiple less to the global warming than the CFC 12 to replace. The result being a visibly diminished TEWI greenhouse effect, which reflects the global atmosphere pollution including the direct greenhouse effect produced by the worst-case total emission of refrigerant and insulation blowing agent without recycling and the indirect greenhouse effect as emission of CO_2 in fossil fuel power stations, resulting of the energy consumption of an appliance. As an example the phase-in-step to the CFC-free technology in August 1993 reveals for the fleet-emission of BOSCH-SIEMENS refrigerators/freezers a TEWI-reduction by 40%.

8004 (ORNL–6805, pp. 289-295) **Flammable refrigerants in household refrigerators.** Juergensen, H. (AEG Hausgeraete AG, Kassel (Germany)). Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Flammable refrigerants have been in the discussion for the phase out of CFC from the beginning. R 152a was one of the candidates, but propane and other hydrocarbons (HC) seemed to work too. The main discussion point was the flammability risk. On the basis of some risc studies in 1988 to 1990 the home appliance manufacturers decided not to take R 152a or other flammables, in USA, Western and Eastern Germany.

8005 (ORNL–6805, pp. 297-317) **Air cycle air conditioning and the use of ammonia in supermarket refrigeration systems.** Hesse, U. (Universitaet Hannover (Germany)). Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

The feasibility of using ammonia as a refrigerant in commercial refrigerators is discussed. The cycle modifications necessary for the use of ammonia refrigerants are outlined. The technical results obtained and the problems yet to be solved are: automatic oil return and the use of ammonia; thermosyphon refrigeration circuit in evaporator/liquid separator circuit; application of safety rules VGB20 (Germany) to the safety concept for the place of installation (in case of breakdown); and inclusion of refrigerant-cooled oil cooler in plants with air-cooled condensor or evaporative condenser. The economics and technical outlook for a new generation of NH_3 chillers are outlined.

8006 (ORNL–6805, pp. 318-328) **Natures refrigerant - propane.** James, R.W. (South Bank Univ., London (United Kingdom)); Missenden, J.F. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

The advantages of using propane for refrigeration systems are examined; these relate to energy efficiency, compressor lubrication, availability, costs, environmental factors and safety. It is concluded that propane is an attractive and environmentally-friendly refrigerant for small systems.

8007 (PNL–10121) **Comparison of current state residential energy codes with the 1992 model energy code for one- and two-family dwellings; 1994.** Klevgard, L.A.; Taylor, Z.T.; Lucas, R.G. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 182p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007015. Source: OSTI; NTIS; GPO Dep.

This report is one in a series of documents describing research activities in support of the US Department of Energy (DOE) Building Energy Codes Program. The Pacific Northwest Laboratory (PNL) leads the program for DOE. The goal of the program is to develop and support the adopting, implementation, and enforcement of Federal, State, and Local energy codes for new buildings. The program approach to meeting the goal is to initiate and manage individual research and standards and guidelines development efforts that are planned and conducted in cooperation with representatives from throughout the buildings community. Projects under way involve practicing architects and engineers, professional societies and code organizations, industry representatives, and researchers from the private sector and national laboratories. Research results and technical justifications for standards criteria are provided to standards development and model code organizations and to Federal, State, and local jurisdictions as a basis to update their codes and standards. This effort helps to ensure that building standards incorporate the latest research results to achieve maximum energy savings in new buildings, yet remain responsive to the needs of the affected professions, organizations, and jurisdictions. Also supported are the implementation, deployment, and use of energy-efficient codes and standards. This report documents findings from an analysis conducted by PNL of the State's building codes to determine if the codes meet or exceed the 1992 MEC energy efficiency requirements (CABO 1992a).

8008 (PNL–10387) **Differences between the 1992 and 1993 CABO Model Energy Codes.** Conover, D.R.; Lucas, R.G. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006488. Source: OSTI; NTIS; GPO Dep.

This report is one in a series of documents describing research activities in support of the US Department of Energy (DOE) Building Energy Standards Program. The Pacific Northwest Laboratory (PNL) leads the program for DOE. The goal of the Program is to develop and encourage the implementation Of Performance standards to achieve the maximum practicable energy efficiency in the design of new buildings. The program approach to meeting the goal is to initiate and manage individual research and standards and guidelines development efforts that are planned and conducted in cooperation with representatives from throughout the buildings community. Projects under way involve practicing architects and engineers, Professional societies and code organizations, industry

representatives, and researchers from the private sector and national laboratories. Research results and technical justifications for standards criteria are provided to standards development and model code organizations and to Federal, State, and local jurisdictions as a basis to update their codes and standards. This effort helps to ensure that building standards incorporate the latest research results to achieve maximum energy savings in new buildings, Yet remain responsive to the needs of the affected professions, organizations, and jurisdictions. Our efforts also support the implementation, deployment, and use of energy-efficient codes and standards. This report identifies the differences between the 1992 and 1993 editions of the Council of American Building Officials, (CABO) Model Energy Code (MEC) and briefly highlights the technical and administrative impacts of these changes.

8009 (SEI-EED–37) **Household energy and nutrition. A study of low-income households in Lusaka.** Chiw, P. (Department of Energy (Zambia)); Muchelemba, J.B.; Siamwiza, R.J.; Ellegaard, A. Stockholm Environment Inst. (Sweden). 1994. 56p. Order Number DE95737665. Source: OSTI; NTIS.

This study was conducted to investigate and provide empirical evidence on energy scarcity and its possible implications on the well-being of the family. A primary aim was to find out if people perceive a household fuel scarcity. Another aim was to determine whether such a scarcity could be expected to affect the nutrition or well-being of the family. Since women are generally responsible for the life-preserving activities in the household, women in low-income families in Lusaka formed the target group. Charcoal is the main source of energy for cooking for the majority of the urban middle and low income families. It is also the main fuel used for heating water for bathing. Over 90% of the population in the study area used charcoal for cooking. People use charcoal primarily it is readily available. It is the men who are mostly responsible for purchasing the charcoal, as for most of the other household purchases. No household fuel scarcity was evidenced. On the contrary, the vast majority of the respondents (95%) did not consider charcoal expensive compared to other household expenditures like food, housing, clothing, etc. Charcoal was found to represent only a small fraction of household expenditure on food items. It is concluded that energy expenditure is not a major issue in the household economy. Requirements appear to be met. Charcoal prices in real terms have been stable or even declining over the part period. Expenditure on energy is in fact so small compared to other household expenditures that a further reduction (if possible) would not greatly improve the household nutrition situation. While the present energy situation does not force people to undertake measures that threaten their health or well-being, it is clear that more energy could be used in order to improve it, for instance by boiling drinking water. 35 refs, 4 figs, 18 tabs

8010 (ANL/ES/CP–84328) **Transportation technology transitions and macroeconomic growth – Contemporary evidence.** Santini, D.J. Argonne National Lab., IL (United States). [1994]. 87p. Sponsored by USDOE, Washington, DC (United States);Japan Automobile Research Inst., Tokyo (Japan). DOE Contract W-31109-ENG-38. (ANL/ES/VU–84328; CONF-9411164–1: International workshop on the motor vehicle and the global environment problem, Tokyo (Japan), 2 Nov 1994). Order Number DE95004617. Source: OSTI; NTIS; GPO Dep.

Viewgraphs are included with this paper.

This paper presents international and temporal extensions of evidence for a theory developed by the author concerning the interaction of transportation technology transitions and macroeconomic growth. The period 1970 to the present is examined for the nations of Japan, the US, and Europe (France, Germany, Italy and the United Kingdom collectively). An addition to the abstract logic supporting the general arguments of the theory is also presented. The theory has been developed concerning the role of significant transportation technology transitions as a cause of significant macroeconomic declines in nations for which the manufacture of transportation vehicles (ships, locomotives, and automobiles) is a dominant economic activity. The theory offers an explanation for periods of pronounced multiyear decline in economic growth rate–sometimes called depressions and sometimes called stagnations. One purpose of this paper is to explore whether or not Japan and Europe have each recently experienced a multiyear event of this type. In the theory and the evidence presented for it, environmental regulation of transportation vehicles has been shown to be an initiating cause of significant technical change, with sharp, sustained fuel price increases being a second frequent initiating cause. These causes of significant technical change, and their possible consequences, are potentially important considerations for those proposing policies to deal with global warming, since both fuel economy regulation and fuel price increases have been recommended by policy analysts as means to reduce transportation's contribution to global warming. The theory has been offered and supported by publications developing mathematical models and examining US historical evidence consistent with the theory.

8011 (DOE/EIA–0585(93)) **Alternatives to traditional transportation fuels 1993.** USDOE Energy Information Administration, Washington, DC (United States). Office of Coal, Nuclear, Electric and Alternate Fuels. Jan 1995. 90p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95005445. Source: OSTI; NTIS; GPO; GPO Dep.

In recent years, gasoline and diesel fuel have accounted for about 80 percent of total transportation fuel and nearly all of the fuel used in on-road vehicles. Growing concerns about the environmental effects of fossil fuel use and the Nation's high level of dependence on foreign oil are providing impetus for the development of replacements or alternatives for these traditional transportation fuels. (The Energy Policy Act of 1992 definitions of "replacement" and "alternative" fuels are presented in the following box.) The Alternative Motor Fuels Act of 1988, the Clean Air Act Amendments of 1990 (CAAA90) and the Energy Policy Act of 1992 (EPACT) are significant legislative forces behind the growth of replacement fuel use. Alternatives to Traditional Transportation Fuels 1993 provides the number of on-road alternative fueled vehicles in use in the United States, alternative and replacement fuel consumption, and information on greenhouse gas emissions resulting from the production, delivery, and use of replacement fuels for 1992, 1993, and 1995.

8012 (KE–93007G) **Study on the CNG storage method using activated adsorbent and CNG combustion technology for vehicles.** Kwon, C.H. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Kim, J.P.; Ko, C.J.; Lee, Y.J.; Kim, B.S.; Kwon, O.S. No corporate text available. Dec 1993. 139p. (In Korean). Order Number DE95744293. Source: OSTI; NTIS (US Sales Only).

In this investigation, we investigate reaction mechanisms on storage system for natural gas in activated adsorbent and found some problems in applying natural gas for vehicles. In addition, we suggest directions for future researches on CNG storage system. In order to construct a data base for divided combustion chamber type lean burn gas engine, we have simply designed a prototype for a divided combustion chamber. Combustion characteristics on the influences by the geometric configuration of a passagehole and equivalence ratio of main and sub chamber have been experimentally examined under the condition of constant volumetric ratio in main-sub combustion chamber in a constant volumetric combustion chamber.

8013 (KE–93012G) **Study on classification of fuel consumption for waggon and jeep and comparison of CVS-75 mode and on-road fuel economy.** Ko, C.J. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Lee, Y.J.; Kwon, C.H.; Kim, B.S.; Kim, J.P.; Kwon, O.S. No corporate text available. Dec 1993. 118p. (In Korean). Order Number DE95744294. Source: OSTI; NTIS (US Sales Only).

The classification standard of fuel economy for the domestic waggon and jeep was established. For compare CVS-75 fuel economy with in-use fuel economy, review on the fuel consumption measuring mode, CVS-75 mode, which authorized by government and made a survey of the traffic characteristic in Seoul metropolitan. As a result, it was showed that CVS-75 fuel economy should be modified by adjustment factor. (author). refs., figs., tabs.

8014 (KFB–94-9) **Emission and energy evaluation principles for transport systems.** Flodstroem, E. (MariTerm AB, Goeteborg (Sweden)); Sjoebris, A. Swedish Transport and Communications Research Board, Stockholm (Sweden). Sep 1994. 74p. (In Swedish). Order Number DE95737686. Source: OSTI; NTIS.

As environmental issues are gaining in importance, the use of energy and emission factors is becoming more frequent in research, investigations etc. The purpose of the factors is to show how energy- and environment-effective the transports are and they are often used for comparisons between different transport modes. The aim of the report is to propose calculation principles that give correct comparisons. The transport work of the transport mode is commonly used as a measure of its performance. The report presents suggestions for corrections with respect to the utilization of the transport mode (volume goods) and differences in real transport distance. Suggested calculation bases build on the principles of high utilization and shortest transport distance respectively. For combined transport modes, such as ferries combining passengers and cargo, a special method for dividing energy consumption and exhaust gas emissions has been designed. Suggested methods have been designed in such a way that available transport statistics can be used. 15 refs., 9 figs., 22 tabs

8015 (ORNL–6805, pp. 225-249) **A CO_2 vapour compression system for vehicle air conditioning.** Pettersen, J. (Norwegian Institute of Technology, Trondheim (Norway)). Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

A new, efficient and environmentally benign automobile air conditioning system "MAC-2000" has been developed at The Norwegian Institute of Technology, in cooperation with Hydro Aluminum. The new system is based on a vapour compression cycle with carbon dioxide as the refrigerant. Although working pressures and component design are different, the basic principle of the CO_2 system is similar to present CFC/HFC units. By development and testing of a laboratory prototype, it has been documented that the CO_2 system is highly competitive to present CFC-12 and HFC-134a units in terms of performance, cost, weight and dimensions. The new concept thus offers a complete solution to the environmental problems associated with motorcar air conditioning, and eliminates all uncertainty with respect to possible unforeseen effects from new refrigerant compounds. Further advantages of the natural fluid CO_2 as a refrigerant are: No need for recycling or recovery, low cost of fluid, excellent availability, well-known properties, and more compact machinery and components.

8016 (ORNL–6805, pp. 251-261) **Application of "natural" refrigerants: New system concepts for the use of CO_2.** Lorentzen, G. (NTH, Trondheim (Norway)). Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

A good half century ago the "freons" were introduced with a massive advertising campaign. The main arguments put forward in their favour were complete safety and harmlessness to the environment. Both of these claims have been proved wrong. Many accidents have occurred due to suffocation in the heavy gas, without warning, in below threshold spaces. Today the CFC's are being banned worldwide as a result of their alleged effect on the ozone layer. At the Copenhagen meeting recently it was decided that the HCFC's must be controlled too. This is by no means a unique experience. Similar predicaments have occurred by release to the environment of many other new chemicals. The extensive use of ever new compounds is one of the big problems of our time. In this situation it does not seem very sensible to replace the CFC/HCFC's with a new family of related hydrocarbons, equally foreign to nature, to be used in quantities of hundred thousand's of tons every year. In principle it must be a much better solution to use naturally occurring substances as refrigerants, compounds already circulating in quantity in the biosphere and which we know are harmless. Examples can be water, air, carbon dioxide, ammonia, hydrocarbons, nitrogen or the noble gases. Some of them are already in the focus for extended use in the future, in particular air, ammonia and propane. In the following it will be shown how the "old" refrigerant CO_2, which has been completely abandoned during the last 40 years, can be used to advantage in new and properly designed systems.

8017 (ORNL–6828) **Transportation Energy Efficiency Trends, 1972–1992.** Greene, D.L. (Oak Ridge National Lab., TN (United States)); Fan, Y. Oak Ridge National Lab., TN (United States). Dec 1994. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95005001. Source: OSTI; NTIS; GPO Dep.

The US transportation sector, which remains 97% dependent on petroleum, used a record 22.8 quads of energy in 1993. Though growing much more slowly than the economy from 1975 to 1985, energy use for transportation is now growing at nearly the same rate as GDP. This report describes the analysis of trends in energy use and energy intensity in transportation into components due to, (1) growth in transportation activity, (2) changes in energy intensity, and (3) changes in the modal structure of transportation activities.

8018 (DOE/BP–1958) **Description of electric energy use in commercial buildings in the Pacific Northwest: 1992 Supplement. End-use Load and Consumer Assessment Program (ELCAP).** Taylor, Z.T. Pacific Northwest Lab., Richland, WA (United States). Jul 1992. 136p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95004894. Source: OSTI; NTIS; GPO Dep.

In December, 1989 Bonneville published Description of Electric Energy Use in Commercial Buildings in the Pacific Northwest, a summary report on the data collected from commercial buildings metered under the End-Use Load and Consumer Assessment Program (ELCAP), for the period 1986 through 1988. Average monthly and annual electric end-use intensities (EUIs, kWh/ft^2) and average load shapes were presented for nine building types and seven or eight end uses, as well as building totals. This document is a supplement to that report. An additional two and one-half years' data (October 1988 through June 1991) have been collected since the original report, resulting in increased numbers of buildings available for analysis. Additionally, some analytical techniques used in the previous report have been improved and some minor bugs corrected. This supplement differs from the original in the following ways: increased sample sizes; improved analytical techniques; corrected aggregation techniques; eliminated building types; eliminated split plots; included Btu/square foot.

8019 (DOE/BP–2457) **Final report, exhaust air heat pump monitoring study.** Koca, R. (Pacific Science and Technology, Inc., Bend, OR (United States)); Swanson, D.; Dent, C. Idaho Dept. of Water Resources, Boise, ID (United States); Pacific Science and Technology, Inc., Bend, OR (United States). Jul 1994. 150p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC79-82BP34625. Contract IDWR-92-03-82-902-41. Order Number DE95004888. Source: OSTI; NTIS; GPO Dep.

A demonstration and research study of exhaust air heat pumps was conducted by the Energy Division of the Idaho Department of Water Resources and Bonneville Power Administration to determine the electrical energy savings available with that technology. Pacific Science and Technology, Inc. (PS&T) was contracted to specify and install metering equipment, collect monthly data, perform analysis, and report results including monthly summaries and a comprehensive final report. Thirty-one exhaust air heat pump (EAHP) water heaters, installed in new Super Good Cents homes in Idaho and Washington, were monitored in detail so that performance and savings values could be determined. Up to 13 months of data were obtained from the sites via postcards that occupants filled out monthly. The coefficient of performance (COP) of the

EAHP units averaged 2.0 (0.3 standard deviation) for all sites. No significant difference in COP was noted between the Idaho and Washington sites. The savings averaged 183 kWh per month or 2200 kWh per year. This corresponds to an annual savings of $110 at a rate of $0.05 per kWh. The average installed cost after subtracting avoided costs was $1800. A simple payback for the unit, therefore, is 16.4 years. Blower door and perfluorocarbon tracer (PFT) gas tests were performed at most sites. The blower door test was a one-time measurement which provided an estimate of natural ventilation rates. The PFT tests lasted for 16 days on average, and accounted for all actual ventilation during the test period, whether natural or mechanically induced. The average natural infiltration rate as measured with the blower door was 0.37 air changes per hour (ACH). For comparison purposes, the blower door data was also adjusted to account for the average weather conditions normally observed during the month in which the PFT test was performed.

8020 (DOE/ER/13676–7) **A general procedure for the synthesis of process flowsheets. Final report, July 16, 1991–July 31, 1993.** Douglas, J.M.; Malone, M.F. Massachusetts Univ., Amherst, MA (United States). Dept. of Chemical Engineering. Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13676. Order Number DE95005668. Source: OSTI; NTIS; GPO Dep.

The research was divided into two parts: examining (1) continuous and (2) batch processes. The work on continuous processes was focused on the development of a more general procedure for the systematic synthesis of process flowsheets that identifies the most important process alternatives (including waste minimization alternatives), the dominant design variables, and the minimum energy consumption for each alternative for continuous, vapor-liquid-liquid-solid processes for the production of nonpolymeric materials. The work was an extension of the hierarchical synthesis procedure previously developed for vapor-liquid processes. A new superstructure for continuous process flowsheets, along with an extended set of rules for the classification of components, with special attention to waste minimization, and solvent selection was developed. The work on batch processes was focused on the development of new procedures for the design and scheduling of multiproduct batch plants. The approach was based on simulated annealing and the solution of the optimal sequencing problem as well as the results on the design problem are described in this report.

8021 (DOE/ER/40888–T1) **A feasibility study for a manufacturing technology deployment center.** Texas Univ., Arlington, TX (United States). 31 Oct 1994. 107p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-94ER40888. Order Number DE95004373. Source: OSTI; NTIS; GPO Dep.

The Automation & Robotics Research Institute (ARRI) and the Texas Engineering Extension Service (TEEX) were funded by the U.S. Department of Energy to determine the feasibility of a regional industrial technology institute to be located at the Superconducting Super Collider (SSC) Central Facility in Waxahachie, Texas. In response to this opportunity, ARRI and TEEX teamed with the DOE Kansas City Plant (managed by Allied Signal, Inc.), Los Alamos National Laboratory (managed by the University of California), Vought Aircraft Company, National Center for Manufacturing Sciences (NCMS), SSC Laboratory, KPMG Peat Marwick, Dallas County Community College, Navarro Community College, Texas Department of Commerce (TDOC), Texas Manufacturing Assistance Center (TMAC), Oklahoma Center for the Advancement of Science and Technology, Arkansas Science and Technology Authority, Louisiana Productivity Center, and the NASA Mid-Continent Technology Transfer Center (MCTTC) to develop a series of options, perform the feasibility analysis and secure industrial reviews of the selected concepts. The final report for this study is presented in three sections: Executive Summary, Business Plan, and Technical Plan. The results from the analysis of the proposed concept support the recommendation of creating a regional technology alliance formed by the states of Texas, New Mexico, Oklahoma, Arkansas and Louisiana through the conversion of the SSC Central facility into a Manufacturing Technology Deployment Center (MTDC).

8022 (DOE/ID/12772–3) **Enhanced boiling heat transfer in horizontal test bundles.** Trewin, R.R.; Jensen, M.K.; Bergles, A.E. Rensselaer Polytechnic Inst., Troy, NY (United States). Aug 1994. 292p. Sponsored by USDOE, Washington, DC (United States);Clark and Crossan Endowed Chair (United States). DOE Contract FC07-88ID12772. Order Number DE94017504. Source: OSTI; NTIS; GPO Dep.

Two-phase flow boiling from bundles of horizontal tubes with smooth and enhanced surfaces has been investigated. Experiments were conducted in pure refrigerant R-113, pure R-11, and mixtures of R-11 and R-113 of approximately 25, 50, and 75% of R-113 by mass. Tests were conducted in two staggered tube bundles consisting of fifteen rows and five columns laid out in equilateral triangular arrays with pitch-to-diameter ratios of 1.17 and 1.5. The enhanced surfaces tested included a knurled surface (Wolverine's Turbo-B) and a porous surface (Linde's High Flux). Pool boiling tests were conducted for each surface so that reference values of the heat transfer coefficient could be obtained. Boiling heat transfer experiments in the tube bundles were conducted at pressures of 2 and 6 bar, heat flux values from 5 to 80 kW/m^2s, and qualities from 0% to 80%, Values of the heat transfer coefficients for the enhanced surfaces were significantly larger than for the smooth tubes and were comparable to the values obtained in pool boiling. It was found that the performance of the enhanced tubes could be predicted using the pool boiling results. The degradation in the smooth tube heat transfer coefficients obtained in fluid mixtures was found to depend on the difference between the molar concentration in the liquid and vapor.

8023 (DOE/ID/12833–1) **Oxygen enriched combustion system performance study. Phase 2: 100 percent oxygen enriched combustion in regenerative glass melters, Final report.** Tuson, G.B.; Kobayashi, H.; Campbell, M.J. Praxair, Inc., Tarrytown, NY (United States). Aug 1994. 124p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC07-88ID12833. Order Number DE95004212. Source: OSTI; NTIS; GPO Dep.

The field test project described in this report was conducted to evaluate the energy and environmental performance of 100% oxygen enriched combustion (100% OEC) in regenerative glass melters. Additional objectives were to determine other impacts of 100% OEC on melter operation and glass quality, and to verify on a commercial scale that an on-site Pressure Swing Adsorption oxygen plant can reliably supply oxygen for glass melting with low electrical power consumption. The tests constituted Phase 2 of a cooperative project between the United States Department of Energy, and Praxair, Inc. Phase 1 of the project involved market and technical feasibility assessments of oxygen enriched combustion for a range of high temperature industrial heating applications. An assessment of oxygen supply options for these applications was also performed during Phase 1, which included performance evaluation of a pilot scale 1 ton per day PSA oxygen plant. Two regenerative container glass melters were converted to 100% OEC operation and served as host sites for Phase 2. A 75 ton per day end-fired melter at Carr-Lowrey Glass Company in Baltimore, Maryland, was temporarily converted to 100% OEC in mid- 1990. A 350 tpd cross-fired melter at Gallo Glass Company in Modesto, California was rebuilt for permanent commercial operation with 100% OEC in mid-1991. Initially, both of these melters were supplied with oxygen from liquid storage. Subsequently, in late 1992, a Pressure Swing Adsorption oxygen plant was installed at Gallo to supply oxygen for 100% OEC glass melting. The particular PSA plant design used at Gallo achieves maximum efficiency by cycling the adsorbent beds between pressurized and evacuated states, and is therefore referred to as a Vacuum/Pressure Swing Adsorption (VPSA) plant.

8024 (DOE/ID/13001–1) **Advanced heat pump for recovery of volatile organic compounds, Phase III - demonstration of BCSRHP mobile regenerator. Final report.** Nuclear Consulting Services, Inc., Columbus, OH (United States). 1 Nov 1994. 244p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC02-90ID13001. (NUCON–05DE300/02). Order Number DE95004438. Source: OSTI; NTIS; GPO Dep.

Under Phase I of the subject contract, feasibility studies and basic engineering studies were performed for a Brayton Cycle Solvent Recovery Heat Pump (BCSRBP) system to prevent pollution from

small source emitters. It was determined that the cost of a complete system, including adsorbers and regeneration process, would be far too much for the small emission source in most cases. This "integrated" approach was therefore not feasible. However, it was concluded that the expensive portion of the Brayton cycle process, the regenerator, could be shared by mounting it on a trailer that could be transported to different sites to regenerate an adsorber. Under Phase II of the project a mobile regenerator (BCSRI-IP) was designed and built to serve a large number of sites. Adsorbers were designed to control emissions for a week or more between regenerations. The purpose of phase III was to demonstrate the cost effectiveness and efficiency of the shared (decoupled) BRAYSORB® solvent recovery system in energy use and emission control compared to other control technologies through a performance testing program at representative industrial and commercial host sites in Southern California. NUCON was the prime contractor for the demonstration portion of this project. Support and funding were received from Southern California Edison Company, South Coast Air Quality Management District, and the U.S. Department of Energy in addition to the contribution by NUCON. Contractual arrangements were completed with each of the host sites and permits for both the stationary and mobile equipment were acquired. The adsorbers were installed at each host site and the appropriate interface connections were made. The mobile regenerator was transported to Southern California for the demonstration.

8025 (DOE/R6/99203–T8) **[DELTA T dryer/moisture control system]. Final technical report.** Drying Technology, Inc., Silsbee, TX (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG46-92R699203. Order Number DE95005115. Source: OSTI; NTIS; GPO Dep.

Drying Technology, Inc. was awarded a grant for the purpose of extending DELTA T dryer/moisture control technology into additional industries. Ultimate purpose of the grant was to save energy and improve efficiency in the process industries. Results indicate that these objectives have been met and will continue as this new technology is duplicated in the present industries and also is extended into other industries as well.

8026 (KE–93024G) **Development of the software for energy savings in chemical processes(I).** Cho, S.C. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Seong, J.S.; Kim, K.I. No corporate text available. Dec 1993. 159p. (In Korean). Order Number DE95744280. Source: OSTI; NTIS (US Sales Only).

Energy conservation in the energy intensive chemical industries, especially in the thermal separation processes is the most effective way for saving industrial energy. The purpose of this project is to research the methods of energy savings in the thermal separation processes and to develop a software for selecting and applying these method. This report is the first term report of the project. The methods of energy savings in distillation processes are investigated and a systematic and effective algorithm for selecting and applying the methods of energy savings in distillation processes is developed. In the next year(second term), a computer program with this algorithm is developed for applying it to real plant. It is expected that about 20% of distillation energy will be saved by application of above methods. The results are as followes. (1). Energy savings in distillation processes can be performed with following techniques; (1) feed optimization (2) doing a good insulation equipment and pipings, (3) setting the product purity by process optimization (4) choice of appropriate control scheme and application of advanced control system, (5) optimum combination of columns by pinch technology, (6) revamping with high efficient distillation columns, (7) utilization of distillate heat of condensing using heat pump, and (8) augment distillation with adsorption, membranes, or other processes to form hybrid system. (2). A systematic and effective algorithm for selecting and applying the methods of energy saving in distillation processes is developed. (author). refs., figs., tabs.

8027 (LBL–36395) **Industrial sector energy conservation programs in the People's Republic of China during the seventh five-year plan (1986–1990).** Liu Zhiping (State Planning Commission, Beijing (China). Energy Research Inst.); Sinton, J.E.; Yang Fuqiang; Levine, M.D.; Ting, M.K. Lawrence Berkeley Lab., CA (United States). Sep 1994. 56p. Sponsored by USDOE, Washington, DC (United States). The impetus at the national level to invest in energy conservation is quite strong and has long been reflected not only in official pronouncements, but also in the investments and organizational activities of the Chinese government. In the early 1980s the central government began a program of direct investments in industrial energy conservation that continues to the present. In addition, concurrently established governmental and quasi-governmental agencies have pursued conservation through administrative and educational measures. In Section 2 of this paper the authors outline the policies and institutions that supported China's program of energy conservation investments in the Sixth and Seventh Five-Year Plans (FYPs) (1981–1985 and 1986–1990). In Section 3 they describe examples of the types of conservation projects pursued in four industrial subsectors: ferrous metals manufacturing; non-ferrous metals mining and manufacturing; chemicals manufacturing; and building materials manufacturing. Section 4 presents a simple methodology for comparing the costs of energy conservation to those of energy supply. Further discussion points out the applicability and limitations of this methodology to State Planning Commission published statistical material on the overall results of energy conservation investments. Though problematic, such analysis indicates that energy conservation investments were probably substantially cheaper than investments in equivalent energy supply would have been. They end with a discussion of some of the difficulties encountered in carrying out the conservation investment programs.

8028 (LUTKDH-TKKA–1001-1-164) **An experimental and theoretical study of multi-cylinder paper drying.** Wilhelmsson, B. Lund Univ. (Sweden). Dept. of Chemical Engineering. Jan 1995. 171p. Order Number DE95737670. Source: OSTI; NTIS.

A mathematical model was developed for the drying of paper in a multi-cylinder drying section. The model is based on the unsteady state, one-dimensional heat conduction equation, which is applied to both the cylinder shell and the paper web. No internal mass transfer phenomena were modelled explicitly. A lumped parameter, the effective thermal conductivity of the paper, implicitly takes these phenomena at least partially into account. Great emphasis was placed on finding the proper heat and mass transfer coefficients that are a part of the boundary conditions of the unsteady state heat conduction equation. Three of these boundary conditions were investigated in detail: * contact heat transfer at the cylinder-paper interface was studied experimentally, * mass transfer at the paper-fabric-air interfaces was also investigated experimentally, and * laminar condensate flow inside the cylinders was studied using a computational fluid dynamics program. Based on the mathematical model, a simulation program was developed. The data predicted by the program compared favorably with measured data from nine different industrial paper dryers. The model applied just as well as lighter paper grades such as newsprint as to heavier grades such as paper board. Two parameters were used to tune the output of the program to the values measured. Both parameters were assigned physically reasonable values confined to a rather narrow range. Studies of the effect of certain input data of the program were also performed. These indicated, for example, that the condensate coefficient and the contact coefficient were the most influential of the heat transfer coefficients, but that the mass transfer coefficient of the dryer fabric was of only slight influence. The potential for simulating different operating conditions was illustrated by several examples. 113 refs

8029 (NEI-DK–1768) **Energy consumption in the primary agricultural activities. Branch analysis.** Gudbjerg, E. (Fredericia Elvaerk (Denmark)); Guul-Simonsen, F.; Lund, I.; Kromann, H.; Lundgaard, N.; Overby, T.; Sams, T.; Kudsk, P.; Lykou, J.; Schriver, P. Danske Elvaerkers Forening, Copenhagen (Denmark); Landbrugets Raadgivningscenter, Aarhus (Denmark); Statens Jordbrugstekniske Forsoeg, Horsens (Denmark). Aug 1994. 220p. (In Danish). Order Number DE95737519. Source: OSTI; NTIS.

The document is one of a series of supplements to 'Haandbog i Energiraadgivning' (Handbook on energy consultancy) and concentrates on the agricultural sector in Denmark. It contains detailed

descriptions of agricultural equipment, processes and working methods and has been written in consultation with specialists in energy saving from the electricity companies, representatives from relevant organizations and research institutions. The main aim is to offer informed and practical suggestions as to ways and means of effectively saving energy also with regard to demands on the handling and storage of raw materials and products. (AB)

8030 (NEI-DK–1769) **Energy consumption in the primary agricultural activities. Branch analysis.** Danske Elvaerkers Forening, Copenhagen (Denmark); Landbrugets Raadgivningscenter, Aarhus (Denmark); Statens Jordbrugstekniske Forsoeg, Horsens (Denmark). Aug 1994. 86p. (In Danish). Order Number DE95737520. Source: OSTI; NTIS.

This supplement to the document of the same title presents case descriptions of 15 farms, tables showing consumption data and other key figures with relation to suggestions as to how to save energy within agriculture. (AB)

8031 (NEI-NO–467) **Studies on control of integrated plants.** Wolff, E.A. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. Jul 1994. 143p. Order Number DE95737634. Source: OSTI; NTIS.

Chemical process plants often apply integration, or coupling between units, to enhance energy and raw material efficiency. This integration between units introduces interaction and may make the plant difficult to operate. This thesis studies how the control properties of plants are affected by integration. Integration topics that are considered are mass recycle, information integration between control levels and heat integration. This work presents procedures and new analysis tools that give a better evaluation of a plants inherent control properties. The gains from such an enhanced analysis are demonstrated through examples. Mass recycle in chemical reaction systems is investigated with respect to control quality. The multivariable effects of introducing recycle are described and analyzed with respect to interaction and disturbance rejection. Several purge actuator configurations are studied and it is shown how their fundamental difference in propagating secondary effects is important. The effect on the results of varying model detail is also studied. The integration of information between control levels is investigated with respect to interaction. Applied to cascade control in distillation the results show how controller tuning can be tailored to achieve one way interaction only. This work shows how a secondary control loop may alter the preferred choice of quality control configuration. An integrated distillation design for separating ternary mixtures is given a comprehensive dynamic analysis for the first time. It is shown that utilization of all the available degrees of freedom for control is difficult. "Holes" in the operating range where fulfilling the specifications is impossible are described. Control solutions are presented and the design is compared to conventional ternary distillation schemes. 93 refs., 66 figs., 17 tabs.

8032 (ORNL–6805, pp. 37-42) **1,1,1,4,4,4 Hexafluorobutane, a new non-ozone-depleting blowing agent for rigid PUR foams.** Lamberts, W.M. (Bayer AG, Leverkusen (Germany)). Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

HCFCs are widely accepted to be technically promising replacements for CFCs in rigid PUR foams, especially for appliance applications. Despite this, political pressure is rising to limit their use to a transition period. One of the reasons is their residual ozone depletion potential. In the search for long term substitutes for both CFCs and HCFCs, we have identified and developed a new blowing agent and insulation gas: 1,1,1,4,4,4 hexafluorobutane (HFC-356). Important properties of the hexafluorobutane are: chlorine-free/non-ozone-depleting; very short atmospheric lifetime/minor greenhouse activity; non-flammable; no explosion limits; suitable boiling point; low gas phase thermal conductivity; and compatibility with appliance inner linear plastics. These properties allow the use of established appliance construction and foaming technology. Nevertheless, reformulation of the PUR components was necessary to design the first PUR appliance system with hexafluorobutane. Extensive laboratory scale testing including foaming of cabinets has been conducted with good results. In comparison with 50% CFC-reduced systems, it fulfills the technical standards of the European appliance industry concerning: cell size/cell structure; flow properties/foam density; thermal conductivity/energy consumption; aging behaviour; demould properties; dimensional stability/compressible strength; and compatibility with SB and ABS inner liners. According to the regulations on chemical substances worldwide, hexafluorobutane is a new chemical substance which requires notification before commercialization. Ecological and toxicological testing of hexafluorobutane is in progress, but not yet completed. Results from acute and subacute inhalation toxicity testing are acceptable and encourage further development of this product.

8033 (ORNL–6805, pp. 43-51) **HFC 356, a zero ODP blowing agent candidate for North American appliance foam formulations.** Ball, E.E. (Miles Inc., Pittsburgh, PA (United States)); Lamberts, W.M. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

The household refrigeration industry in the USA is being challenged on two issues. These issues are depletion of the ozone layer by CFCs and federally mandated energy consumption standards for the products sold in the US. The global issue of ozone depletion affects all domestic appliance producers in North America. The energy consumption issue, however, only affects those producers who desire to sell their products in the US. In addressing the ozone depletion issue the North American manufacturers of household refrigerators and freezers have accepted HCFCs as the most promising available blowing agent substitutes for CFCs in their polyurethane foam insulations. Over the past few years a great deal of effort has gone into the development of polyurethane foam insulations blown with HCFCs which have the properties required by the North American household refrigeration industry. Between now and 1995 we expect a conversion of the industry from CFC to HCFC blown polyurethane foam insulations. HCFCs, however, are only transition materials. Since their ozone depletion potentials are not zero, they too are scheduled for production caps and phase-out under the provisions of the amendments to the Montreal Protocol. Thus, it is necessary to begin the development now on the next generation of North American appliance foam formulations which do not use ozone depleting substances as blowing agents.

8034 (ORNL–6805, pp. 53-62) **Blowing agents: The next generation.** Decaire, B.R. (Allied-Signal Inc., Buffalo, NY (United States)); Pham, H.T.; Richard, R.G.; Shankland, I.R. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

It is increasingly recognized that HCFC materials are transitional or interim substances which will have limited commercial lifetimes as foam blowing agents. These materials, which are necessary for a rapid and complete phaseout of CFC blowing agents, will ultimately need to be replaced by even more environmentally benign blowing agents. The paper addresses two general blowing agent options: The conventional liquid blowing agent, and the lower boiling, so-called gaseous blowing agent. Liquid blowing agents like CFC-11 and HCFC-141b simplify foam processing techniques as well as blowing agent storage, handling and transportation. Optimum properties for this class of blowing agents, such as boiling point, flammability and thermal conductivity are summarized. Chemical classes, for example hydrofluorocarbons (HFCs) and hydrofluoroethers (HFEs), from which a next generation blowing agent might be chosen are discussed; physical properties of some model compounds chosen from these families are presented. The model compound data show that retaining the vapor insulation characteristics of HCFC-141b will be a challenge given that the

more complicated polyatomic HFCs and HFEs tend to exhibit higher vapor phase thermal conductivities. There are several HFC gases which are also potential blowing agents, for instance HFC-134a, which is currently being introduced as a commercial product as well as others like HFCs 32 and 125 which are currently under development. Vapor phase thermal conductivity data are presented which show that these species are also poorer insulators than HCFC-141b. Polyol solubility for the HFC gases can be significantly less than even HCFC-22 when compared on a theoretical equivalent (mole) substitution, i.e., a higher vapor pressure is required to maintain an equivalent solution of HFC gas in a polyol than is required for HCFC-22. These and other data presented will impact the choice of the next generation blowing agent.

8035 (ORNL–6805, pp. 63-75) **Cyclopentane as blowing agent for rigid polyurethane foam in refrigerator insulation.** Adams, S. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Rigid polyurethane (PUR) foam is the major insulation material in household and commercial refrigeration. Production, design and properties of refrigerators, freezers and display cabinets correspond strongly to: the easy processing of PUR systems; their ability to form a light sandwich structure; and their good insulation values. Our target was, to look for economical Zero-ODP PUR blowing agents. They must be able to be used in existing production facilities with acceptable efforts in reconstruction. We had to focus on good insulation values, because an increase in energy consumption isn't acceptable at all. For the tight time frame of Chlorofluorocarbon (CFC)-substitution given, we had to look for alternatives which are or can be made available in industrial Quantities in time.

8036 (ORNL–6805, pp. 77-86) **Water-blown rigid urethane foam for thermal insulation.** Beddies, H. (Univ. of Stuttgart (Germany)); Wagner, K.E.; Hesselbach, I.J. Oak Ridge National Lab., TN (United States). [1994]. (CONF-9309409–: 1993 non-fluorocarbon insulation, refrigeration and air-conditioning technology workshop, Wiesbaden (Germany), 27-29 Sep 1993). In *Proceedings of the 1993 non-fluorocarbon insulation, refrigeration and air conditioning technology workshop.* 329p. Order Number DE94018333. Source: OSTI; NTIS.

Due to low thermal conductivity and good mechanical properties rigid urethane foam (RUF) is often used for thermal insulation applications. The low thermal conductivity of the foam is based on the use of CFC 11, which has the lowest λ-value of all used blowing agents. With the prohibition of CFC 11 (in Germany on January 1st of 1995) industry and research institutes are looking for suitable alternatives. Within the research project "Halonefree Urethane Foam" supported by the German Ministry of Research and Technology, the IKP is optimizing water-blown polyurethane-systems without using halone containing additives and blowing agents.

8037 (PNL–10365) **Commercial equipment cost database.** Freeman, S.L. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 105p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95006191. Source: OSTI; NTIS; GPO Dep.

This report, prepared for DOE, Office of Codes and Standards, as part of the Commercial Equipment Standards Program at Pacific Northwest Laboratory, specifically addresses the equipment cost estimates used to evaluate the economic impacts of revised standards. A database including commercial equipment list prices and estimated contractor costs was developed, and through statistical modeling, estimated contractor costs are related to equipment parameters including performance. These models are then used to evaluate cost estimates developed by the ASHRAE 90.1 Standing Standards Project Committee, which is in the process of developing a revised ASHRAE 90.1 standard. The database will also be used to support further evaluation of the manufacturer and consumer impacts of standards. Cost estimates developed from the database will serve as inputs to economic modeling tools, which will be used to estimate these impacts. Preliminary results suggest that list pricing is a suitable measure from which to estimate contractor costs for commercial equipment. Models developed from these cost estimates accurately predict estimated costs. The models also confirm the expected relationships between equipment characteristics and cost. Cost models were developed for gas-fired and electric water heaters, gas-fired packaged boilers, and warm air furnaces for indoor installation. Because of industry concerns about the use of the data, information was not available for the other categories of EPAct-covered equipment. These concerns must be addressed to extend the analysis to all EPAct equipment categories.

8038 (PNL-SA–24367) **Rejuvenation and recovery of electroplating acids using the WADR technology.** Jones, E.O. (Pacific Northwest Lab., Richland, WA (United States)); Litt, R.D.; Chauhan, S. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 6p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941007–4: Joint power generation conference, Phoenix, AZ (United States), 2-6 Oct 1994). Order Number DE95004568. Source: OSTI; NTIS; GPO Dep.

Acid baths at the US Air Force/Oklahoma City Air Logistic Center (OC-ALC) will be rejuvenated by the use of a new technology – Waste Acid Detoxification and Reclamation (WADR), a distillation process that concentrates the metals and creates a clean reusable acid. The concentrated metals are recovered for disposal or recycling. A 200-gallon batch prototype system will be installed and demonstrated on HCl, HNO_3 and H_2SO_4 baths at OC-ALC's electroplating shop in late 1994. The system was tested in the summer of 1994 with typical industrial spent acids. The WADR system is expected to reduce waste from the OC-ALC acid baths by 80% to 90% as compared with current treatment operations. Laboratory test results and the prototype system design are presented here. The technology is expected to meet the needs of various industries generating spent acids with increasing disposal costs.

8039 (SAND–93-2122) **Summary report: Assessment and opportunity identification of energy efficient pollution prevention technologies and processes.** Sandia National Labs., Albuquerque, NM (United States). Nov 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95004728. Source: OSTI; NTIS; GPO Dep.

On October 24, 1992, the President signed the Energy Policy Act of 1992 (EPAct, Public Law 102-486). Section 2108, subsections (b) and (c), of EPAct requires the Department of Energy to identify opportunities to demonstrate energy efficient pollution prevention technologies and processes; to assess the availability and the energy, environmental, and cost effects of such technologies; and to report the results within one year. This report is in response to that requirement. National waste reduction efforts in both the private and public sectors encompass a variety of activities to decrease the amount of wastes that ultimately enter their air, water, and land. DOE's Office of Industrial Technologies (DOE/OIT) recognized the importance of these efforts and confirmed the federal government's commitment to waste reduction by establishing the Industrial Waste Program (IWP) in 1990. The program is driven by industry and national needs, and is working on new technologies and information dissemination that industry identifies as vital. The national benefits of new technologies do not accrue to the economy until transferred to industry and incorporated into commercially available processes or products.

8040 (SAND–94-2568) **Full report: Assessment and opportunity identification of energy efficient pollution prevention technologies and processes.** Sandia National Labs., Albuquerque, NM (United States). Nov 1994. 225p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95004692. Source: OSTI; NTIS; GPO Dep.

US industry produces about 12 billion tons of waste a year, or two-thirds of the waste generated in the US. The costs of handling and disposing of these wastes are significant, estimated to be between $25 and $43 billion in 1991, and represent an increase of 66% since 1986. US industry also uses about one-third of all energy consumed in the nation, which adds to the environmental burden. Industrial wastes affect the environmental well-being of the nation and, because of their growing costs, the competitive abilities

of US industry. As part of a national effort to reduce industrial wastes, the US Congress passed the Energy Policy Act (EPAct, P.L. 102-486). Section 2108, subsections (b) and (c), of EPAct requires the Department of Energy (DOE) to identify opportunities to demonstrate energy efficient pollution prevention technologies and processes; to assess their availability and the energy, environmental, and cost effects of such technologies; and to report the results. Work for this report clearly pointed to two things, that there is insufficient data on wastes and that there is great breadth and diversity in the US industrial sector. This report identifies: information currently available on industrial sector waste streams, opportunities for demonstration of energy efficient pollution prevention technologies in two industries that produce significant amounts of waste–chemicals and petroleum, characteristics of waste reducing and energy saving technologies identifiable in the public literature, and potential barriers to adoption of waste reducing technologies by industry.

8041 (BNL–61006) **A summary of the report on prospects for pyrolysis technologies in managing municipal, industrial, and Department of Energy cleanup wastes.** Reaven, S.J. Brookhaven National Lab., Upton, NY (United States). Aug 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95005003. Source: OSTI; NTIS; GPO Dep.

Pyrolysis converts portions of municipal solid wastes, hazardous wastes and special wastes such as tires, medical wastes and even old landfills into solid carbon and a liquid or gaseous hydrocarbon stream. In the past twenty years, advances in the engineering of pyrolysis systems and in sorting and feeding technologies for solid waste industries have ensured consistent feedstocks and system performance. Some vendors now offer complete pyrolysis systems with performance warranties. This report analyzes the potential applications of pyrolysis in the Long Island region and evaluates the four most promising pyrolytic systems for their readiness, applicability to regional waste management needs and conformity with DOE environmental restoration and waste management requirements. This summary characterizes the engineering performance, environmental effects, costs, product applications and markets for these pyrolysis systems.

The use of salt and salt/sand mixtures on icy roadway surfaces has dramatically increased during the past 30 years. Despite extensive documentation on salt related damage to the roadway improvements, vehicles and the environment, road maintenance departments have continued to rely on this practice. Road maintenance departments in northern climate areas have long recognized the safety benefits for public mobility on icy roadways from the use of sand. As an abrasive material, the sand improves the surface traction that results in more drivable and less hazardous road conditions during the winter months. Stockpiles of pure sand stored during the winter months oftentimes freeze into large unworkable, monolithic piles. To maintain a free-flowing condition, it has been found to be necessary to add salt to the sand. The addition of salt in amounts ranging from 5 to 10 percent to that of sand, is usually sufficient to provide relatively free-flowing abrasive material that could be stored in stockpiles and applied to icy road surfaces with conventional sand spreading trucks. Another alternative for winter storage of pure sand to maintain a free-flowing condition is in humidity-controlled, heated buildings. As would be expected, this method has high capital and operating costs. and not cost effective for general highway maintenance use. The invention demonstrated herein is a method of thermally modifying pure sand that will remain in a free-flowing state throughout the winter season without the need for the salt additive. The thermally modified sand provides an abrasive material that when applied to icy roads does not cause environmental and corrosive damage as done by the application of sand with salt. By employing a very simple process of freezing screened sand particles by forced air convection under subfreezing conditions, the invention creates a product that has significant value in terms of economic and environmental benefits.

The Urban Consortium Energy Task Force pioneers energy and environmental solutions for US cities and counties. When local officials participate in the task force, they open the door to many resources for their communities. The US is entering a period of renewed interest in energy management. Improvements in municipal energy management allow communities to free up energy operating funds to meet other needs. These improvements can even keep energy dollars in the community through the purchase of services and products used to save energy. With this idea in mind, the US Department of Energy Municipal Energy Management Program has funded more than 250 projects that demonstrate innovative energy technologies and management tools in cities and counties through the Urban Consortium Energy Task Force (UCETF). UCETF helps the US Department of Energy foster municipal energy management through networks with cities and urbanized counties and through links with three national associations of local governments. UCETF provides funding for projects that demonstrate innovative and realistic technologies, strategies, and methods that help urban America become more energy efficient and environmentally responsible. The task force provides technical support to local jurisdictions selected for projects. UCETF also shares information about successful energy management projects with cities and counties throughout the country via technical reports and project papers. The descriptions included here capsulize a sample of UCETF's demonstration projects around the country.

8045 (DOE/MC/27205–3963) **AFBC co-firing of coal and hospital waste. Quarterly progress report, May 1, 1994–July 31, 1994.** Stuart, J.M. Department of Energy, Morgantown, WV (United States). Morgantown Energy Technology Center. [1994]. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-91MC27205. Order Number DE95006147. Source: OSTI; NTIS; GPO Dep.

Objective is to design, construct, install, and provide operator training and start up a circulating fluidized bed combustion system at the Lebanon, PA Veteran's Affairs Medical Center. This unit will co-fire coal and hospital waste, providing inexpensive and efficient destruction of both general and infectious hospital waste and steam generation. The State permitting process required for construction is completed. Construction and equipment fabrication is continuing, as is equipment purchase from vendors. The foundation was completed. A current schedule is included.

Order Number DE95744283. Source: OSTI; NTIS (US Sales Only).

The production rate per one day was 75,096T/D. The production rates per one person per one day was 1.8kg/c.d which was reduced by 18.6% in 1992. The amount of waste treated by landfill was 66,965T/D or 89/1%, that by incineration was 1,132T/D or 1.5%, and that by recycling was 5,912T/D or 7.9%. The production rates and states of treatment, landfill areas, treatment schedule and components of the municipal solid wastes of three cities of Pusan, Daejeon and Chungju are investigated. Physical components were as follows; paper 18.2%, vinyl and plastics 14.1%, rubber and leather 1.1%, textile 2.8%, wood 1.8%, food waste 48.7%, metals 3.9%, glass 7.4%, and others 2.0%. Moisture contents, combustible components and ignition ashes were investigated 46.0%, 39.4%, and 14.6%, respectively. Heating values were as follows ; high heating values 5,063kcal/kg, low heating values 2,129kcal/kg. For chemical components were as follows ; carbon 46.3%, hydrogen 6.6%, oxygen 43.2%, nitrogen 1.5%, sulfur 0.2%, and chlorine 2.2%. The problems of reuse of the wastes and collection of the classified garbage wastes are analyzed and thier solutions are suggested. (author). refs., figs., tabs.

8048 (NEI-DK–1813) **District heating strategy plan for Lithuania. Report C. General proposals for rehabilitation projects.** Danish Energy Consultants, Glostrup (Denmark). Jun 1994. 120p. Contract IMOe-768; Contract ENs-2124/59-0003. Order Number DE95737592. Source: OSTI; NTIS.

In this report, a number of general proposals for the Lithuanian district heating systems are described, partly based on the proposals from the pilot projects. The proposals are divided into: Proposals are divided into: Proposals concerning heat production, heat distribution and heat consumption. For each of the proposals an economic and an environmental analysis have been carried out. The tables of heat production, distribution and consumption give an overview of the proposals and show the results of the economic analyses. For a few of the proposals the total quantity and investment needed in Lithuania has been assessed. Equipment for Vilnius, Alytus and Kaunas is not included in these totals, since equipment for these cities is described in separate reports/studies. For most of the projects it is not possible to assess the quantities without more detailed investigations. (EG)

8049 (NREL/TP–463-7230) **Hourly simulations of hybrid renewable energy systems for San Cristobal/Santa Barbara, Guatemala.** Holz, R. (National Renewable Energy Lab., Golden, CO (United States)); Corbus, D.; Hurley, P.; Aguilar, I. National Renewable Energy Lab., Golden, CO (United States). Nov 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-950116–4: 1995 American Society of Mechanical Engineers (ASME) energy sources technology conference and exhibition, Houston, TX (United States), 29 Jan - 1 feb 1995). Order Number DE95000265. Source: OSTI; NTIS; GPO Dep.

This paper presents the results of a conceptual systems analysis comparing alternative, renewable energy-based, hybrid power systems to a conventional diesel genset for a remote, non-electrified village in Guatemala. A time-series computer simulation model, HYBRID1, was used to calculate the performance of the various systems; a separate analysis was used to determine the life-cycle cost of energy for each system. Detailed hourly simulation computer models, such as HYBRID1, are necessary to properly account for the time-varying loads, renewable resources, performance of the generators, and battery state of charge, as well as accommodating alternative system architectures and control/dispatch strategies. The analysis considers several anticipated load profiles for the village, to account for the possibilities of productive and water pumping loads in addition to the base load of household lighting and communications. For this particular site, the lowest cost of energy would be supplied by a wind-diesel-battery system, with a control strategy that operated the diesel in a backup (switched) mode.

8050 (NUTEK-FJV–94-7) **Energy dense water.** Fransson, Aake (University of Umeaa, Department of Applied Physics (Sweden)); Skoglund, P. The effective energy in a district heating system is limited by the heat capacity of the circulating water. This energy is emitted when the water is cooled. The energy transport capacity of a district heating system can be increased if a suitable phase-change material is added to the transmission fluid. The latent heat, liberated at the crystallization process, is for some materials very high. A high transition energy would compensate the decrease in heat capacity arised from the reduction in the volume of the transmission fluid. The aim of this new research program on advanced fluids is to get an understanding for and improve the essential thermodynamic, kinetic and technical limitations of materials that may be used as additives. Measurements of significant thermodynamic properties such as the hysteresis of the melting/crystallization temperature and the heat of crystallization will be discussed for some polyesters. 15 refs, 4 figs

8052 (NUTEK-FJV–94-7, pp. 1-18 (Paper II)) **Specific heat capacity and melting/crystallisation characteristics of polytridecanolactone.** Skoglund, P. (University of Umeaa. An investigation of the thermodynamically properties of polytridecanolactone (PTDL), has been made with the aid of a differential scanning calorimeter (DSC). PTDL is a linear polyester and belongs to the polylactones which is poorly investigated. In this paper we contribute with specific heat capacity in the range 180-400 K, melting and glass transition characteristics. Further, we present unique results corresponding to the effect of different cooling rates on crystallisation temperatures and crystallisation energies. PTDL has a melting temperature of 350 K, and a glass transition at about 237 K. The crystallisation results show that PTDL crystallizes easily, with a crystallisation degree of about 80%. Further, the crystallisation energy decreases with increasing cooling rate, and levels out at a constant value at higher cooling rates. The crystallisation temperature on the other hand, shows an increasing sensitivity of cooling rate, where the supercooling is increasing more rapid at higher cooling rates. 25 refs, 3 figs, 1 tab

A district heating network acts like a heat storage device, due to the finite circulation times in combination with the performances of the attached substations. This means that the heat load at the district heating plant is not only determined by the substations heat demand. In this article the influence on the heat load from net structures and operational strategies for the primary supply water temperature is discussed from a simple deterministic model of a district heating network. In the used model the flow demands and return temperatures of the substations of two-stage type are calculated for ideal static conditions. The circulation time of the primary water is calculated from flows and pipe dimensions under ideal conditions where heat losses are neglected. The obtained result shows that the commonly used strategy for the supply temperature (increasing with decreasing outdoor temperature) in combination with the net structure yields amplified variations of the heat load compared to the demands of the attached consumers. It is also shown that from a more elaborate choice of supply temperature the variations of the heat load may be reduced. 4 refs, 8 figs

8055 (PNL-SA–24553) **Raman spectroscopic studies in supercritical water.** Bowman, L.E.; Fulton, J.L. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9410114–3: 3. international symposium on supercritical fluids, Strasbourg (France), 17-19 Oct 1994). Order Number DE95004577. Source: OSTI; NTIS; GPO Dep.

Reaction studies have been carried out on the destruction of nitrogen-containing compounds such as ammonium, nitrates, and species containing aromatic nitro functionality. The destruction of ammonium ion in near-critical and supercritical water using Raman spectroscopy is the subject of this presentation. Reaction rates were determined from Raman spectra and from measurements of system pressure. Concentrations of key species in the reactor effluent were determined via off-line assay. The effects of temperature, pressure, and concomitants on reaction rate were determined. The reaction half-life is below ten seconds at 400 C with better than 95% conversion. Oxides of nitrogen were not generated in detectable quantities. The studied system is a model for the destruction of ammonium in municipal wastes.

The Advanced Diesel Engine Component Development (ADECD) Program is a multi-year, multi-phase effort to develop and demonstrate the critical technology needed to advance the heavy-duty low heat rejection (LHR) engine concept for the long-haul, heavy-duty truck market. The ADECD Program has been partitioned into two phases. The first phase, Phase 1, was completed in 1986, resulting in definition of the Advanced Diesel Reference Engine (ADRE)III. The second phase, Phase 11/111, examines the feasibility of the ADRE concepts for application to the on-highway diesel engine. Phase 11/111 is currently underway. This project is sponsored by the U.S. Department of Energy, Office of Transportation Technologies. The work has been performed by the Detroit Diesel Corporation (DDC) under Contract DEN3-329 with the NASA Lewis Research Center, who provide project management and technical direction.

8057 (ETDE-DE–1) **Improvements in heavy oil fuel systems for marine diesel engines.** Kirschnick, H.H. (comp.). Technische Univ. Berlin (Germany). Inst. fuer Schiffs- und Meerestechnik. Jun 1989. 210p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT MTK0426. Order Number DE95738918. Source: OSTI; NTIS (US Sales Only).

The project is concerned with the investigation of two fuel preparation systems in real on-board operation. The two systems which consist on the one hand of a decanter/separator combination and, on the other, of a simple homogeniser/filter combination (fine filtration) requiring little maintenance, should be compared regarding the cleaning effort and the effect on the drive plant, which is determined by running bush gusset wear measurements. Further, the operation of a simplified fuel supply system, which is designed as an 'open' system with recirculation via the day's tank, is to be examined. The research project comprises two phases: Phase 1: Operation of the fuel system during a six-month period. Phase 2: Operation of the fuel system with some modifications for another six-month period. 8058 (LUTMDN-TMVK–7016) **Impact of combustion chamber geometry on charge stratification in a CNG fueled direct injection Otto engine.** Egnell, R. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Dec 1994. 179p. Order Number DE95737683. Source: OSTI; NTIS.

The modest objective of the Stratified Charge (SC) system presented in this report is to solve the problem with emissions of nitrogen oxide and particulate from diesel engines without sacrificing the good fuel economy. In theory it should be possible to reach this goal as the emission levels are not related to the efficiency of this engine type. The suggested solution is based on a combustion chamber design and an injection system that makes it possible to better control the stratification process. The fuel, in this case natural gas, is deposited in a restricted and load dependent volume of the conically shaped combustion chamber by a long fuel injection tube. At the beginning of the project the question whether or not the injection tube would survive in this environment had the highest priority. Hence a theoretical analysis of the heat loads on the tube was initiated. The results from the tests clearly indicate that the stratification process can be controlled by the geometry of the combustion in combination with the fuel injection system. The new system makes it possible to limit the fuel diffusion and maintain a richer mixture in a predetermined part of the combustion chamber. Thus the emissions of unburned fuel can be reduced if compared with a SC system with a conventional combustion chamber. However, in the present SC system it is not possible to control the air/fuel ratio distribution within the mixture. Emission data indicates the combustion of the fuel charge takes place at different conditions giving high emissions of soot, nitrogen oxide and unburned fuel at the same time. In order to continue the development work of the new SC system the combustion chamber must be optically accessible to make visual studies and laser based measurements possible. 33 refs., 156 figs

8059 (LUTMDN-TMVK–7017) **The development of diagnostic techniques for the spark discharge and the flame characteristics, applied in a lean burn spark ignition engine to examine the relations between the spark discharge, the flame, the heat release and the fluid flow.** Lassesson, B.; Marforio, K. Lund Univ. (Sweden). Dept. of Heat and Power Engineering. Dec 1994. 198p. Order Number DE95737682. Source: OSTI; NTIS.

This thesis deals with the development of measurement systems for a research SI-engine, operating with lean air-fuel mixture, to examine the causes of cycle to cycle variations. The data acquisition system consists of four major parts: A flame imaging system and measurement systems for spark ignition parameters, in cylinder fluid flow and cylinder pressure. This report deals with the designing of the flame imaging and spark ignition measurement systems. Measurements have been performed of a single cylinder research engine. The purpose of the flame imaging system was to extend the heat release analyses to a much lower degree than the pressure measurement allows. To achieve information about the combustion start, the supplied voltage and current to the spark plug was measured and analysed. The data, achieved from the

entire acquisition system, have been statistically analysed to investigate the correlation between the combustion parameters, i.e. the mean velocity and turbulence of the air-fuel mixture in the vicinity of the spark plug, the breakdown voltage and supplied current to the spark plug, the flame development from the imaging system and the heat release parameters from the pressure analyses. The flame imaging system consists of two single shot CCD-cameras and they have been used with schlieren technique in two configurations, one time resolving and one 'two-view' arrangement. The spark current was measured during five decades of time. To achieve this, it was necessary to use a very fast digital storage oscilloscope to resolve the first micro second and extended with an ordinary storage oscilloscope to measure the entire spark duration. 23 refs., 9 tabs., 160 figs

Source: OSTI; NTIS; GPO Dep.

The objectives of the first phase of the program was to demonstrate the feasibility of a 10 kW fuel cell powerplant fueled by methanol. This powerplant is based on a methanol fuel processor and a proton exchange membrane (PEM) fuel cell stack. In the second phase, the powerplant will be scaled up to 30 kW and a 60 kW brassboard system with a 30 kW battery will be built. In the final phase, the fuel cell powerplant will be scaled to 45-60 kW and a proof-of-concept fuel cell vehicle will be built and tested.

8061 (DOE/METC–94/1010, pp. 109-110) **Phosphoric acid fuel cell for buses.** Kaufman, A. (H-Power Corp., Belleville, NJ (United States)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States); USDOE Morgantown Energy Technology Center, WV (United States). Aug 1994. DOE Contract AC02-91CH10447. (CONF-940883–: Fuel cells '94, Morgantown, WV (United States), 17-19 Aug 1994). In *Proceedings of the fuel cells '94 contractors review meeting.* 191p. Order Number DE94012285. Source: OSTI; NTIS; GPO Dep.

A methanol-fueled, phosphoric acid fuel cell (PAFC) powered bus has been built under Phase II of a cost-shared Government program. The current project is utilizing the technology of Phase I, in which liquid-cooled PAFC technology was shown to be suitable for use in transit bus applications. The objective of the Phase II project is to integrate and demonstrate a PAFC/battery power source in actual bus use. This project will produce three 30-foot test-bed buses and the conceptual design for a 40-foot bus. The methanol-fueled PAFC-powered bus offers attractive incentives in the areas of reduced noxious emissions (CO typically 50-100 times lower and NO_x typically 2000-3000 times lower than the 1998 federal heavy-duty diesel exhaust emission standards and virtually no hydrocarbons or particulate matter, based on current PAFC system technology); domestically-produced alternative fuel usage; higher propulsion system efficiency (higher vehicle mileage per unit of fuel energy content in relation to corresponding diesel power plants that operate on either diesel or methanol fuel); and greatly reduced noise pollution. These fuel cell buses are being built so as to be fully consistent with the design requirements of heavy-duty transit buses in service today. These include performance criteria (acceleration; hill-climbing; top speed) as well as comfort (e.g., heating/air conditioning) and safety features. The test-bed bus incorporates seats for 25 passengers and the driver. In addition, in compliance with Americans with Disabilities Act (ADA) requirements, a wheelchair lift is provided along with means to accommodate two wheelchairs.

3304 Hybrid Systems

8062 (NREL/TP–473-7026) **Developing a standardized test procedure for hybrid vehicles: The challenge of the SAE HEV task force.** Penney, T. (National Renewable Energy Lab., Golden, CO (United States)); Christensen, D.; Poulos, S. National Renewable Energy Lab., Golden, CO (United States). Nov 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-9410256–2: Society of Automotive Engineers' convergence '94, Detroit, MI (United States), 18-27 Oct 1994). Order Number DE95000280. Source: OSTI; NTIS; GPO Dep.

In 1992, the Society of Automotive Engineers (SAE) established a task force to develop a procedure for measuring electric energy consumption, all-electric range, fuel economy, and exhaust emissions for hybrid vehicles; the procedure will be submitted to regulatory agencies as representing the automotive industry's recommendations. The draft procedure is currently being tested on hybrid vehicles. The University of Maryland's parallel hybrid was tested in September 1994, and the University of California-Davis' parallel hybrid and the University of Illinois' series hybrid will be tested in November 1994 and January 1995, respectively. The procedure is being modified to incorporate any lessons learned, and the task force hopes to recommend the final procedure to the SAE by mid 1995.

3307 Emission Control

8063 (LBL–36383) **Carbon monoxide oxidation over three different states of copper: Development of a model metal oxide catalyst.** Jernigan, G.G. (California Univ., Berkeley, CA (United States). Dept. of Chemistry). Lawrence Berkeley Lab., CA (United States). Oct 1994. 200p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95004682. Source: OSTI; NTIS; GPO Dep.

Carbon monoxide oxidation was performed over the three different oxidation states of copper – metallic (Cu), copper (I) oxide (Cu_2O), and copper (II) oxide (CuO) as a test case for developing a model metal oxide catalyst amenable to study by the methods of modern surface science and catalysis. Copper was deposited and oxidized on oxidized supports of aluminum, silicon, molybdenum, tantalum, stainless steel, and iron as well as on graphite. The catalytic activity was found to decrease with increasing oxidation state ($Cu > Cu_2O > CuO$) and the activation energy increased with increasing oxidation state (Cu, 9 kcal/mol < Cu_2O, 14 kcal/mol < CuO, 17 kcal/mol). Reaction mechanisms were determined for the different oxidation states. Lastly, NO reduction by CO was studied. A Cu and CuO catalyst were exposed to an equal mixture of CO and NO at 300–350 C to observe the production of N_2 and CO_2. At the end of each reaction, the catalyst was found to be Cu_2O. There is a need to study the kinetics of this reaction over the different oxidation states of copper.

8064 (NREL/TP–425-6722) **Development of a dedicated ethanol ultra-low emission vehicle (ULEV) system design.** Bourn, G. (Southwest Research Inst., San Antonio, TX (United States)); Callahan, T.; Dodge, L.; Mulik, J.; Naegeli, D.; Shouse, K.; Smith, L.; Whitney, K. National Renewable Energy Lab., Golden, CO (United States); Southwest Research Inst., San Antonio, TX (United States). Feb 1995. 90p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004016. Source: OSTI; NTIS; GPO Dep.

The objective of this 3.5 year project is to develop a commercially competitive vehicle powered by ethanol (or ethanol blend) that can meet California's ultra-low emission vehicle (ULEV) standards and equivalent corporate average fuel economy (CAFE) energy efficiency for a light-duty passenger car application. The definition of commercially competitive is independent of fuel cost, but does include technical requirements for competitive power, performance, refueling times, vehicle range, driveability, fuel handling safety, and overall emissions performance. This report summarizes a system design study completed after six months of effort on this project. The design study resulted in recommendations for ethanol-fuel blends that shall be tested for engine low-temperature cold-start performance and other criteria. The study also describes

three changes to the engine, and two other changes to the vehicle to improve low-temperature starting, efficiency, and emissions. The three engine changes are to increase the compression ratio, to replace the standard fuel injectors with fine spray injectors, and to replace the powertrain controller. The two other vehicle changes involve the fuel tank and the aftertreatment system. The fuel tank will likely need to be replaced to reduce evaporative emissions. In addition to changes in the main catalyst, supplemental aftertreatment systems will be analyzed to reduce emissions before the main catalyst reaches operating temperature.

3308 Alternative Fuels

8065 (NEI-SE–186) **Scenarios for introduction of bioethanol.** Elam, N. (Atrax Energi AB, Goeteborg (Sweden)). Swedish Transport and Communications Research Board, Stockholm (Sweden). May 1994. 157p. (In Swedish). Order Number DE95737666. Source: OSTI; NTIS.

This report discusses in a 10 year perspective some different approaches to continue introducing ethanol as an automotive fuel in Sweden, and tries to elucidate the costs and environmental effects of such introduction alternatives. Ethanol can be used in pure, or almost pure form, or in different blends with conventional automotive fuels. For pure alcohol propulsion of otto- or diesel engines it is in most cases necessary to introduce new or modified engine constructions. In a short perspective and for a faster introduction there are the fuel-mix and low-blend alternatives. This means fuel-mixes that can be utilized in existing engines, without need for rebuilding or adjusting of the engines. The study concerns a possible developing program to the year 2005 for production capacity within Sweden, from raw materials and technology we now knows comparatively well. 46 refs, 12 figs, 40 tabs

35 ARMS CONTROL

3501 Policy, Negotiations, and Legislation

8066 (ANL/DIS/CP–84533) **Fourth and Fifth Amendment issues raised by Chemical Weapons Convention inspections.** Tanzman, E.A. (Argonne National Lab., IL (United States). Economics and Law Section). Argonne National Lab., IL (United States). 21 Oct 1994. 13p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. Contract DNA001-90-C-0177. (CONF-9410265–1: Continuing legal education seminar on legal implications for business of the chemical weapons convention, Philadelphia, PA (United States), 21 Oct 1994). Order Number DE95004600. Source: OSTI; NTIS; GPO Dep.

The Chemical Weapons Convention (CWC) offers a unique challenge to the United States system of constitutional law. This discussion is about the Fourth and Fifth Amendment issues raised by the CWC and about how federal implementing legislation can allow verification inspections to take place in the United States under the Chemical Weapons Convention while remaining in compliance with the Constitution. By implementing legislation, the author means a federal statute that would be enacted separately from Senate approval of the Convention itself. Although implementing legislation is a relatively unusual accompaniment to a treaty, it will be necessary to the CWC, and the Administration has submitted a bill that was under consideration in the last Congress and presumably will be reintroduced early next year. The Fourth and Fifth Amendment problems posed by the CWC arise from the verification inspection scheme embodied in the treaty. The CWC depends heavily on on-site inspections to verify compliance with its key requirements. These include destroying all chemicals weapons stockpiles and bringing potential chemical weapons precursors under international control. The Convention contains four distinct kinds of inspections: systematic inspections of chemical weapons storage and destruction facilities, routine inspections of various declared facilities, challenge inspections, and a variant on challenge inspections in cases of alleged use of chemical weapons. All inspections are supposed to be only as intrusive as necessary to carry out the Convention. These inspections will be carried out by inspectors employed by the Organization for the Prohibition of Chemical Weapons (OPCW), located in The Hague, which is responsible for enforcing the Convention. Generally, the inspected State Party is permitted to assign observers to accompany the inspectors.

8067 (ANL/DIS/CP–84908) **Legal aspects of national implementation of the Chemical Weapons Convention.** Tanzman, E.A. (Argonne National Lab., IL (United States)); Zeuli, A.R.; Kellman, B. Argonne National Lab., IL (United States). 28 Nov 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9411163–1: Regional seminar on the national implementation of the chemical weapons convention, Jakarta (Indonesia), 28 Nov 1994). Order Number DE95004635. Source: OSTI; NTIS; GPO Dep.

The author discusses some legal aspects of measures at the national level to implement the Chemical Weapons Convention (CWC). These implementing measures are universal, applying not only to the few States Parties that will declare and destroy chemical weapons, but also to the many States Parties that have never had a chemical weapons program. This new need for national measures to implement multilateral arms control agreements has generated unease due to a perception that implementation may be burdensome and at odds with national law. In 1993, concerns arose that the complexity of integrating the treaty with national law would cause each nation to effectuate the Convention without regard to what other nations were doing, thereby engendering significant disparities in implementation steps among States Parties. The author discusses progress among several States in actually developing national CWC implementing measures. Implementing measures from Australia, Norway, South Africa, and Sweden were available to him in English through the PTS. He compares them in order to illustrate different approaches to national implementation that are emerging. Of course, it is important to note that this brief survey necessarily omitted examination of the existing "background" of other, related domestic laws that these signatories might also have adopted that affect CWC implementation.

8068 (UCRL-LR–114070-7) **Director's series on proliferation.** Bailey, K.C.; Price, M.E. (eds.). Lawrence Livermore National Lab., CA (United States). 27 Dec 1994. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95005655. Source: OSTI; NTIS; GPO Dep.

The Director's Series on Proliferation is an occasional publication of essays on the topics of nuclear, chemical, biological, and missile proliferation. The seven papers presented in this issue cover the following topics: Should the Treaty on the Nonproliferation of Nuclear Weapons (NPT) be amended?; NPT extension - Legal and procedural issues; An Indonesian view of NPT review conference issues; The treaty of Tlatelolco and the NPT - Tools for peace and development; Perspectives on cut-off, weapons dismantlement, and security assurances; Belarus and NPT challenges; A perspective on the chemical weapons convention - Lessons learned from the preparatory commission.

8069 (DOE/ER/45201–T2) **Microstructural behavior of nonequilibrium systems. Final report, March 1, 1986–May 31, 1993.** Li, J.C.M. Rochester Univ., NY (United States). Dept. of Mechanical Engineering. Nov 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85ER45201. Order Number DE95004450. Source: OSTI; NTIS; GPO Dep.

The major achievements made during this period are as follows: (1) negative creep in metallic glasses and mechanochemical spinodal decomposition; (2) magnetic domain structure at shear bands and annealing embrittlement of metallic glasses; (3) etch pits along shear bands in metallic glasses; (4) increase of Curie temperature by rapid heating; (5) molecular dynamics simulation of melting; (6) nanoporous materials; (7) dislocation-crack interactions; (8) recovery processes of deformed structure; and (9) differences in deformation mechanisms between metals and polymers. A brief discussion is given for each achievement.

8070 (ANL/ET/CP–82012) **Swelling and structure of vanadium-base alloys irradiated in the dynamic helium charging experiment.** Chung, H.M.; Loomis, B.A.; Smith, D.L. Argonne National Lab., IL (United States). Aug 1994. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940657–8: 17. symposium on effects of radiation on materials, Sun Valley, ID (United States), 20-23 Jun 1994). Order Number DE95004659. Source: OSTI; NTIS; INIS; GPO Dep.

Combined effects of dynamically charged helium and neutron damage on density change, void distribution, and microstructural evolution of V-4Cr-4Ti alloy have been determined after irradiation to 18–31 dpa at 425–600 C in the Dynamic Helium Charging Experiment (DHCE), and the results were compared with those from a non-DHCE in which helium generation and negligible. For specimens irradiated to ≈18-31 dpa at 500–600 with a helium generation rate of 0.4–4.2 appm He/dpa, only a few helium bubbles were observed at the interface of grain matrices and some of the Ti(O,N,C) precipitates, and no microvoids or helium bubbles were observed either in grain matrices or near grain boundaries. Under these conditions, dynamically produced helium atoms seem to be trapped in the grain matrix without significant bubble nucleation or growth, and in accordance with this, density changes from DHCE and non-DHCE (negligible helium generation) were similar for comparable fluence and irradiation temperature. Only for specimens irradiated to ≈31 dpa at 425 C, when helium was generated at a rage of 0.4–0.8 appm helium/dpa, were diffuse helium bubbles observed in limited regions of grain matrices and near ≈15% of the grain boundaries in densities significantly lower than those in the extensive coalescences of helium bubbles typical of other alloys irradiated in tritium-trick experiments. Density changes of specimens irradiated at 425 C in the DHCE were significantly higher than those from non-DHCE irradiation. Microstructural evolution in V-4Cr-4Ti was similar for DHCE and non-DHCE except for helium bubble number density and distribution. As in non-DHCE, the irradiation-induced precipitation of ultrafine Ti_5Si_3 was observed for DHCE at >500 C but not at 425 C.

8071 (ANL/MSD/PP–82718) **Epitaxial growth of bcc transition metal films and superlattices onto MgO (111), (011) and (001) substrates.** Mattson, J.E.; Fullerton, E.E.; Sowers, C.H.; Bader, S.D. Argonne National Lab., IL (United States). Apr 1994. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004629. Source: OSTI; NTIS; GPO Dep.

We demonstrate epitaxial growth of the bcc transition metals Nb, Mo, Fe, and Cr via sputtering onto single crystal MgO substrates. The epitaxial growth orientations are (011), (112) and (001) when grown onto MgO (111), (011) and (001), respectively. Further we demonstrate that under appropriate growth conditions, superlattices of these materials (e.g., Fe/Cr, Fe/V and Mo/V) can be grown with the same epitaxial order as the films.

8072 (BNL–61136) **A study of the electrochemical behavior in tungsten and caustic solutions and platinum/iridium in chloride solutions, informal report.** Vitus, C.M. (Brookhaven National Lab., Upton, NY (United States)); Isaacs, H.S.; Schroeder, V. Brookhaven National Lab., Upton, NY (United States). 22 Nov 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95004951. Source: OSTI; NTIS; GPO Dep.

Platinum/iridium and tungsten wires were electronically etched in chloride and caustic solution, respectively, to produce tips with high aspect ratio. A direct relationship between the meniscus and the aspect ratio of etched tips was established. Scanning electron micrographs indicated that higher aspect ratios were obtained by changing the geometry of the meniscus during the etch either by an increase in the applied a.c. voltage or with the addition of a nonpolar layer above the electrolytic solution during the etching process. Above the breakdown voltage, two possible mechanisms appeared to control the etching process by expediting chemical dissolution: cavitation and sparking. Cavitation caused erosion due to the force of evolved gases against the electrode and sparking attacked the surface by vaporizing the metal. Sparking commenced on both wires near 24V. This voltage corresponded to a minimum in the plot of total etch time versus voltage. From light emission studies, sparking on Pt/Ir was associated with the ionization of Pt, Ir, Ca, and Cl. A compositional analysis of insoluble black particles produced during a.c. and d.c. etching of Pt/Ir revealed Pt and Ir as the major constituents of the product. The sparking process was shown to have a potential use in micromachining.

8073 (CEA-R–5572) **Study of point defects and matter transport in cubic face centered concentrated alloys.** Hersant, D. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie des Materiaux. Jan 1991. 246p. (In French). Order Number DE95612035. Source: OSTI; NTIS (US Sales Only); INIS.

It is shown that the second moment approximation to the tight binding method allows a functional to be set up which describes transition metals, noble metals and their alloys. It is assumed that the local electronic density of states is rectangular and that the width varies from site to site. It is then shown how the Monte Carlo method can be used to study order in solid solution with a large difference in size between components: atoms of different nature are exchanged and their neighbours are simultaneously displaced in accordance with the microscopic theory of elasticity. The phase diagram of the simulated alloys is then constructed. Experimental results are qualitatively well reproduced but transition temperatures are difficult to evaluate accurately because of a bad estimation of the vibration entropy. A local tendency towards ordering due to chemical effects is shown at the defect proximity. 40 figs., 100 refs.

8074 (CEA-R–5654) **Ordered compounds under irradiation: dynamical equilibrium phase diagrams and microstructural evolutions.** Soisson, F. CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France). Dept. de Technologie des Materiaux. Oct 1993. 169p. (In French). Order Number DE95615149. Source: OSTI; NTIS (US Sales Only); INIS.

The diffusion in an ordered alloy under irradiation is modelled on a rigid lattice with two atomic exchange mechanisms acting in parallel: thermally activated and forced jumps. Two descriptions are proposed and applied to the A2-B2 disorder-order transition in bcc compounds: a deterministic kinetic method in the Bragg-Williams approximation and Monte Carlo simulations. Dynamical equilibrium phase diagrams under irradiation are built; microstructural evolutions are studied: a new mechanism for irradiation induced elimination of antiphase boundaries is identified as well as the various dissolution modes of ordered precipitates. The shift from second to first order of the A2-B2 transition, predicted by the model, has been experimentally checked by 1 MeV electron irradiations of a FeAl alloy. 60 figs., 135 refs.

8075 (CONF-941016–5) **Synthesis of Ni_3Al and NiAl intermetallics.** Sikka, V.K. (Oak Ridge National Lab., TN (United States)); Cooper, R. Oak Ridge National Lab., TN (United States). [1994]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Materials week '94; Rosemont, IL (United States); 3-7 Oct 1994. Order Number DE95005897. Source: OSTI; NTIS; GPO Dep.

Intermetallics are an attractive class of advanced materials. The aluminide intermetallics offer advantages including: (1) lower density, (2) oxidation resistance, (3) carburization resistance, and (4) interesting mechanical properties because of their ordered crystal structure. Even though the attractive properties of the aluminides

and other intermetallics have been known for nearly four decades, their practical applications have not been developed for two reasons: (1) poor ductility (in some cases at both ambient and high temperatures) and (2) lack of processability into meaningful components. Recent advances such as ductilization of Ni_3Al by small additions of born and the knowledge that environmental effects are the major cause of poor ductility in Fe_3Al and FeAl systems have brought the intermetallics into the forefront of research and their commercial applications. This paper describes a method for melting Ni_3Al-based alloys that successfully utilize the exotherm for formation of NiAl from elemental materials. The reaction-synthesis method has also been utilized for the production of NiAl and NiAl-based alloy powders from the elemental powders. Reaction-synthesized powders of NiAl and NiAl-based alloys were consolidated by hot extrusion and evaluated for tensile properties over a temperature range from room temperature to 1050 C. The powder-processing conditions have been found to have more influence on the ductile-to-brittle transition temperature of NiAl than the powder- production method.

8076 (CONF-941144–53) **Time dependent indentation testing at non-ambient temperatures utilizing the high temperature mechanical properties microprobe.** Lucas, B.N. (Oak Ridge National Lab., TN (United States)); Oliver, W.C. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95005895. Source: OSTI; NTIS; GPO Dep.

Time dependent indentation data for pure indium from −100°C to 75°C is presented. The properties reported include hardness, indentation strain rate, stress exponent and apparent activation energy for creep. These properties were measured using a depth-sensing indentation system capable of performing experiments between −100°C and 300°C in ultra-high vacuum. In addition, by employing laser interferometric techniques, this system can obtain displacement data with time constants as low as 50 ns. This allows the investigation of the material response to very fast stress changes over an extremely wide range of strain rates. The adverse and beneficial dynamic effects of step-loading the indenter into the surface of the material will be discussed. Initial results obtained from this type of experiment show that it is possible to obtain energy dissipation or damping information from the material being studied.

8077 (CONF-950110–17) **Process monitoring using a Quality and Technical Surveillance Program.** Rafferty, C.A. Oak Ridge Y-12 Plant, TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 12. symposium on space nuclear power and propulsion; Albuquerque, NM (United States); 8-12 Jan 1995. Order Number DE95005896. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of process monitoring using a Quality and Technical Surveillance Program was to help ensure manufactured clad vents sets fully met technical and quality requirements established by the manufacturer and the customer, and that line and program management were immediately alerted if any aspect of the manufacturing activities drifted out of acceptable limits. The Quality and Technical Surveillance Program provided a planned, scheduled approach to monitor key processes and documentation illuminated potential problem areas early enough to permit timely corrective actions to reverse negative trends that, if left uncorrected, could have resulted in deficient hardware. Significant schedule and cost impacts were eliminated.

8078 (DOE/PC/92542–T8) **Robotic weld overlay coatings for erosion control. Quarterly technical progress report, July–September, 1994.** Levin, B.F.; Dupont, J.N.; Marder, A.R. Lehigh Univ., Bethlehem, PA (United States). Energy Research Center. 26 Oct 1994. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92542. Order Number DE95005187. Source: OSTI; NTIS; GPO Dep.

Research is presently being conducted to develop a criteria for selecting weld overlay coatings for erosion mitigation in Circulated Fluidized Beds. Initially, eleven weld overlay alloys were selected for erosion testing based upon a literature review. All eleven coatings were deposited on 1018 steel substrates using the plasma arc welding process. Ten samples from each coating were prepared for erosion testing. All selected coatings were erosion tested at 400 C and their erosion resistance was evaluated by determining the steady state erosion rate. In addition, the microstructure of each coating was characterized before and after the erosion tests. No correlations were found between room temperature hardness of the weld overlay coatings and their erosion resistance at elevated temperature. It was suggested that weld overlays mechanical properties such as fracture strength, toughness and work hardening rates may contributed to their erosion resistance. During the previous two quarters the microhardness tests were performed on the eroded samples in order to determine the size of the work hardened zone and the change in the coatings hardness due to erosion. As a result of these measurements it was established that one group of coatings deformed plastically, while another did not. In addition, the measurements of the weld overlays microhardness at 400 C were made. The coatings microhardness at 400 C was plotted versus their volume erosion rates. During the last quarter, erosion tests were performed for Inconel-625, 316L SS, and Iron-Aluminide wrought alloys in order to compare their erosion behavior with similar weld overlays. The results of microhardness profile measurements for all weld overlay coatings were analyzed. The factors that contribute to the erosion resistance of the coatings that deformed plastically are discussed in this progress report.

8079 (GKSS–93/E/78) **Simulation and stability testing of the fuzzy control of an implant welding unit.** Blidung, T. Technische Univ. Hamburg-Harburg, Hamburg (Germany). 1993. 112p. (In German). Order Number DE95738841. Source: OSTI; NTIS (US Sales Only).

Non-linear or processes disturbed by noise demand new concepts of controlling. The aim is to control despite the non-linearity or minimize the influence of noise, respectively. In many cases the use of Fuzzy-Logic seems to be a reasonable solution. Many successes increase the research done on the field during recent times. The subject of this paper is to develop a controller in order to control the electrode spacing of an arc, and to show the stability of the controlled plant. The aim is to proof that the feed back control system is able to control the arc. The proof is done on the base of quantity and quality models as well. All Fuzzy-Logic calculations are done by a micro-controller made by Togai. Quantity simulations are used to check the stability of the process by changing its parameters. It is shown that the quality modelling and controlling keep the arc at its working area with a sufficient probability of success for practical use. (orig.)

8080 (GKSS–94/E/32) **Local quantitative phase analysis of two-phase TiAl(Cr)-alloys by analytical transmission electron microscopy.** Pfullmann, T. GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Werkstofforschung; Technische Univ. Hamburg-Harburg, Hamburg (Germany). 1994. 167p. (In German). Order Number DE95738115. Source: OSTI; NTIS (US Sales Only).

Two-phase TiAl(Cr)-alloys with a composition of 48 at.%Al have been investigated as potential low density high temperature materials. The tetragonality of the γ-phase, which may strongly influence the mechanical properties of the alloys, was determined with high precision and spatial resolution. For this it was necessary to improve the accuracy of analytical electron microscopy methods (EDX, HOLZ line analysis). The results show a variation of Al-content among γ-TiAl lamellae within one specimen and a linear relationship between lattice parameters and composition. The results of heat treatments in two-phase regions and the influence of chromium are presented in detail and discussed with respect to the mechanical properties. (orig.)

This report reviews the status of R and D and the material specifications of nuclear components in order to develop the stainless steels for nuclear applications, and the technology of computer-assisted alloy design is developed to establish the thermodynamic data of Fe-Cr-Ni-Mo-Si-C-N system which is the basic stainless steel systems. High strength and corrosion resistant stainless steels, 316LN and super clean 347, are developed, and the manufacturing processes and heat treatment conditions are determined. In addition, a martensitic steel is produced as a model alloy for turbine blade, and characterized. The material properties showed a good performance for nuclear applications. (Author).

The melting and casting parameters has been investigated for obtaining the proper U-Zr alloy. So a sound alloy ingot was sucessfully prepared. The Zr yield with the respected to the charged raw material is about 85%. The Zr content variation along the ingot is ± 0.2 wt%. At that time the melt was hold for three minutes at 1600 deg C. The microstructure of U-Zr ingot has been found to consist of α U as a matrix and δ-UZr_2 as a coarse dispersion in the matrix. Additionally the U-Zr melt was rapidly solidified into powder by utilizing centrifugal atomizer. This powder tends to form fine and homogeneous microstructure. (Author).

We surveyed the current status and problems in S/G U-tubes in Korea and worldwide. Also we gathered manufacturing specifications of S/G U-tubes and compared/analyzed the differences in them company by company. We produced alloy 600 tubes (in cooperation with Sammi Special Steels) through V.I.M. (Vacuum Induction Melting; 2 ton capacity), 4 steps of hot press forging, hot extrusion (10:1 of reduction ratio), 3 steps of cold pilgerings and so on. We will continue to characterize the tubes and 2nd time preproduce the tubes using the feed-back data. With regard to alloy 690, which is getting popular for S/G U-tubes worldwide, we cast four 60 Kg ingots and two 6 Kg ingots by V.I.M.. We analyzed the chemical composition, macrostructures, hot workability, and so on ; all ingots were good except on 60 Kg ingot. Finally we produced high quality alloy 690 ingot (about 1 Kg) by E.S.R. (Electroslag Remelting) method (in cooperation with Yeoungnam University). We used CaF/CaO/Al2O3/MgO quartenary slag system. We have made directionally grown good ingots by E.S.R. and especially the hot workability at 1100 deg C - the temperature at which V.I.M. ingots showed very poor hot workability - was very much improved (from 30 to 90 % of reduction of area). We continue to analyze the effects of E.S.R. to the structure and properties of alloy 690 (grain size, morphology, and directionality; any changes of inclusions and so on). (Author).

8102 (KFK–5353) **Metallurgical and mechanical tests on the low activating martensitic chromium steel OPTIFER-IV.** Schaefer, L. (Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion); Kempe, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion; Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung. Aug 1994. 28p. (In German). Order Number DE95738282. Source: OSTI; NTIS (US Sales Only); INIS.

Derived from a martensitic chromium-steel (1.4914) with high strength at elevated temperatures, a new low activating steel OPTIFER-IV, Chg. 986489, had been developed for an application as 'First Wall' - and as structural material for fusion devices. The alloying elements with high activation like Mo, Ni and Nb had been substituted by similar acting, but low activating elements like W and Ta. Some metallurgical and mechanical properties had been tested in order to decide the kind of alloying. The new steel is fully martensitic without δ-ferrite, fine-grained and well hardenable. The tensile properties satisfy the requirements, and the notch impact bending properties are excellent. (orig.)

8103 (LBL–34612) **New vision on surface diffusion.** Xiao, X.D. (Univ. of California, Berkeley, CA (United States). Dept. of Physics); Xie, Y.; Shen, Y.R. Lawrence Berkeley Lab., CA (United States). Aug 1993. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9308154–5: 4. international conference on the structure of surfaces, Shanghai (China), 16-19 Aug 1993). Order Number DE95004686. Source: OSTI; NTIS; GPO Dep.

Although surface diffusion has been a subject of extensive studies, its understanding is still rudimentary. The authors have recently developed a novel technique utilizing optical diffraction from a laser-induced one-dimensional monolayer grating to probe chemical surface diffusion. Since the diffusion involved is one-dimension, it can be easily analyzed. By varying the grating period, the measurable diffusion coefficient can have a dynamic range of about 9 orders of magnitude, from 10^{-6} cm^2/sec to 10^{-15} cm^2/sec. If the grating is properly oriented, anisotropic surface diffusion can be readily measured. Also the technique is applicable to both metals and semiconductors and probably even insulators of fluids. Finally, with linear optical diffraction, the sensitivity of the technique can be so high that a grating with a modulation of a few percent of a monolayer is easily detectable. Therefore, the coverage dependence of surface diffusion can also be investigated. The authors have used this technique to study CO diffusion on Ni(110). They are interested in: (1) the coverage dependence of anisotropic diffusion; (2) impurities effects on diffusion; and (3) defect effects on diffusion.

8104 **Structural alloy with a protective coating containing silicon or silicon-oxide.** Natesan, K. 1992. Filed date 30 Nov 1992. U.S. Patent Application 7-983,188. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95006121. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of an iron-based alloy containing chromium and optionally, nickel. The alloy has a surface barrier of silicon or silicon plus oxygen which converts at high temperature to a protective silicon compound. The alloy can be used in oxygen-sulfur mixed gases at temperatures up to about 1100°C.

8105 (PNL-SA–21635) **Calculation of transmutation in copper and comparison with measured electrical properties.** Greenwood, L.R. (Pacific Northwest Lab., Richland, WA (United States)); Garner, F.A.; Edwards, D.J. Pacific Northwest Lab., Richland, WA (United States). Aug 1993. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9308257–1: 8. American Society for Testing and Materials symposium on reactors, Vail, VA (United States), 29 Aug - 3 sep 1993). Order Number DE95004557. Source: OSTI; INIS; NTIS; GPO Dep.

Calculations of the transmutation of pure cooper have been performed for the Fast Flux Test Facility/Materials Open Test Assembly (FFTF/MOTA) and for the STARFIRE first-wall fusion reactor. The principal transmutation products in decreasing order of importance are nickel, zinc, and cobalt. Contrary to previously published calculations, nickel and zinc are produced at nearly equal rates in FFTF, but cobalt is insignificant. The fusion reactor case shows much higher transmutation rates and produces about twice as much nickel as zinc. Transmutation rates for FFTF were determined using adjusted neutron energy spectra based on dosimetry measurements at various positions in the MOTA. The predicted transmutation rates were compared directly with nickel concentrations measured by Energy Dispersive X-Ray Spectrometry (EDS) microchemistry and with measurements of the electrical conductivity of copper and two copper alloys irradiated in the MOTA. Measurements and calculations agree within ±15%.

8106 (SAND–94-1810C) **New novel cleaning technique for extending mean time between mechanical cleans in a Genus tungsten CVD reactor.** Lujan, R.D. (Sandia National Labs., Albuquerque, NM (United States). Center for Microelectronics Technologies); Fleming, J.G.; Baird, J.L.; Gentry, M.S. Sandia National Labs., Albuquerque, NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410269–1: Ceramics and advanced materials symposium, Albuquerque, NM (United States), 31 Oct 1994). Order Number DE95004546. Source: OSTI; NTIS; GPO Dep.

During the chemical vapor deposition of blanket tungsten from the reduction of tungsten hexafluoride (WF_6), metallic parts within the reaction chamber accumulate metallic tungsten, tungsten oxyfluorides, and other related tungsten species. The usual method for removal of the chamber deposits is to open the chamber and perform a labor intensive mechanical clean, which involves the use of hydrogen peroxide (H_2O_2) and deionized (DI) water, or an in-situ fluorine-base plasma clean. The authors have investigated the use of repetitive in-situ nitrogen trifluoride (NF_3) plasma cleans during the course of operating a Genuse 8721 tungsten chemical vapor deposition reactor. The Genuse reactor has been retrofitted with self-ratchetting linear slides, which allow the wafer clamps to be extended into the NF_3 plasma. They have extended the mean

time between failures (MTBF) due to the use of 10 minute plasma clean every 75–100 wafers. Deposition for this process is 8,000 angstroms per wafer, using 6 deposition sites. The total tungsten deposition for a 0.5 micron tungsten plug is 4 microns, per a 25 wafer lot. Instead of a total removal of the accumulated tungsten from the chamber hardware, a partial etchback of the deposition from the wafer clamps and wafer chucks was performed. With this, sources for particles and backside deposition were eliminated. They see an increase in wafer-to-wafer uniformity, lot-to-lot repeatability, and particle reduction due to the use of frequent plasma clean. Recovery time after a plasma clean is excellent and no detrimental effects from hydrogen fluoride "poisoning" were seen.

8107 (SAND–94-3047C) **Mass transport through polycrystalline microstructures.** Swiler, T.P.; Holm, E.A.; Young, M.F.; Wright, S.A. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–22: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004552. Source: OSTI; NTIS; GPO Dep.

Mass transport properties are important in polycrystalline materials used as protective films. Traditionally, such properties have been studied by examining model polycrystalline structures, such as a regular array of straight grain boundaries. However, these models do not account for a number of features of real grain ensembles, including the grain size distribution and variations in grain shape. In this study, a finite difference scheme is developed to study transient and steady-state mass transport through realistic two dimensional polycrystalline microstructures. Comparisons with the transport properties of traditional model microstructures provide regimes of applicability of such models. The effects of microstructural parameters such as average grain size are examined.

8108 (SAND–95-8455C) **Understanding and improving materials processing through interpreting and manipulating predictive models.** Kee, R.J.; Ting, A.; Spence, P.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. (CONF-941144–19: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004384. Source: OSTI; NTIS; GPO Dep.

Most physically based modeling software accepts input in the form of geometry definition, physical parameters, initial conditions, and boundary conditions; and then, on the basis of solving physical conservation equations, predicts the steady-state or transient behavior of a system or process. There is a growing need to create software tools that can themselves control or manipulate the physically based models in certain ways to enhance the usability of models for equipment design and process optimization. These required tools can be described broadly in the following categories: sensitivity analysis, parameter estimation, inverse problems, dynamic optimization, and real-time control. This paper discusses generally the development and application of such modeling tools, drawing examples from a specific RTP reactor design. These techniques accelerate significantly the optimal design of processes and the concurrent engineering of real-time process-control algorithms.

8109 (SP–94-65) **Crack closure - an experimental study.** Johansson, Klas. Swedish National Testing and Research Inst., Boraas (Sweden). 1994. 39p. (In Swedish). Order Number DE95737656. Source: OSTI; NTIS.

This paper investigates relations between crack growth rate and crack opening levels (as expressed with the stress intensity factor). No relations have been detected for the two different types of load history, studied in this paper. The crack opening level, expressed with the stress intensity factor, is defined as the level where the crack is fully open. This level is detected as the break-point between two straight lines in the load-displacement curve. The first load history contains an overload block in a positive pulsating load. The minimum load is zero during all these tests. During the block the maximum is increased to 125%, 150% or 175% of 15 $MPax(m)^{1/2}$. In an additional test the effects of even higher overloads were investigated. In this test the maximum load was increased to 200% of the originally load 17 $MPax(m)^{1/2}$, during the overload block. The crack growth rate behaves as the theory predicts, with noticeable acceleration and retardation. The measured stress intensity opening or closure levels do not behave as theory predicts, however. The second load history contains an underload block with the same amplitude as the overload block. The maximum load is kept constant at 15 $MPax(m)^{1/2}$ and the minimum load is decreased from zero to 25%, 50% or 75% of a compressive load of 15 $MPax(m)^{1/2}$. In the underload case no predictions for crack rate can be made for the block sequence. The measured stress intensity opening or closure levels do not behave as theory predicts. One possible explanation why the expected relations can not be observed in any of two different load histories, is an inability to accurately measure opening and closure levels with the global technique chosen. 14 refs, 34 figs, 2 tabs

8110 (SVF–522) **Corrosion testing of three highly alloyed stainless steels in hot chlorinated seawater.** Wallen, B. (Avesta Sheffield AB, Avesta (Sweden)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Dec 1994. 34p. (In Swedish). Order Number DE95737675. Source: OSTI; NTIS.

Three Avesta Sheffield steels, 254 SMO, 654 SMO and SAF 2507, have been tested in seawater heated to 55 degrees C. In a first test the specimens were exposed in a water which was continuously chlorinated with 2 ppm. The corrosion conditions were very severe and crevice corrosion was observed in all three steels. Pitting corrosion occurred in the welds of 254 SMO and SAF 2507 but no in 654 SMO. In a second test the continuous chlorination was preceded by a period with intermittent chlorination. During this period the passivity of the steels was improved and after subsequent exposure to continuously chlorinated water the degree of corrosion was strongly reduced. Only 654 SMO was completely resistant to crevice corrosion in flange connections and for pitting corrosion in girth welded pipes are discussed. 9 refs, 27 figs, 7 tabs

8111 (UCRL-ID–119235) **Characterization of ultradispersed aluminum.** Simpson, R.L.; Maienschein, J.L.; Swansiger, R.W.; Garcia, F.; Darling, D.H. Lawrence Livermore National Lab., CA (United States). 8 Dec 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006379. Source: OSTI; NTIS; GPO Dep.

Samples of ultradispersed Al were received, which were produced by electrically exploding Al wires in argon. These samples comprised very small particles that were not significantly oxidized and that were stable in air. Particle morphology were studied with SE, micropycnometry, and gas adsorption surface area. Composition were determined using various techniques, as were thermal stability and reaction exotherms. The inexplicable reports of an Al-Ar compound and of an exothermic reaction were not confirmed. The material is a stable, nonoxidized, small-particle, highly reactive form of aluminum that is of interest in energetic materials formulations.

8112 (ANL/ET/CP–83901) **A phenomenological model for the effect of nanocrystalline microstructure on irradiation-induced amorphization in U_3Si.** Rest, J. Argonne National Lab., IL (United States); Oak Ridge National Lab., TN (United States). Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ; AC05-84OR21400. (CONF-941144–20: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004631. Source: OSTI; NTIS; INIS; GPO Dep.

A rate theory model is formulated wherein amorphous clusters are formed by a damage event. These clusters are considered centers of expansion (CEs), or excess-free-volume zones. Simultaneously, centers of compression (CCs) are created in the material. The CCs are local regions of increased density that travel through the material as an elastic (e.g., acoustic) shock wave. The CEs can be annihilated upon contact with a sufficient number of CCs, to

form either a crystallized region indistinguishable from the host material, or a region with a slight disorientation (recrystallized grain). Recrystallized grains grow by the accumulation of additional CCs. Full amorphization is calculated on the basis of achieving a fuel volume fraction consistent with the close packing of spherical entities. Amorphization of a recrystallized grain is hindered by the presence of a grain boundary. Preirradiation of U_3Si above the critical temperature for amorphization results in the formation of nanometer-size grains. In addition, subsequent reirradiation of these samples in the same ion flux at temperatures below the critical temperature shows that the material has developed a resistance to radiation-induced amorphization (i.e., a higher dose is needed to amorphous preirradiated samples than those that have not been preirradiated). In the model, it is assumed that grain boundaries act as effective defect sinks, and that enhanced defect annihilation is responsible for retarding amorphization below the critical temperature. The calculations have been validated against data from ion-irradiation experiments with U_3Si. For appropriate values of the activation energy of thermal crystallization, the model predicts the evolution of a two phase microstructure consisting of nanocrystalline grains and amorphous clusters.

8113 (ANL/ET/CP–84563) **Effects of Bi and Bi_2O_3 additions on the microstructure and superconducting properties of powder-in-tube BSCCO (2212) tapes.** Guo, J. (Univ. of Illinois, Urbana, IL (United States). Dept. of Materials Science and Engineering); Lewis, J.A.; Goretta, K.C. Argonne National Lab., IL (United States). Oct 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941013–19: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95004605. Source: OSTI; NTIS; INIS; GPO Dep.

The microstructural development and superconducting properties of $Bi_2Sr_2CaCu_2O_x$ (Bi-2212) Agclad powder-in-tube tapes with 2 vol% bismuth (Bi) added from either Bi (s) or Bi_2O_3 powders were investigated. Such additives reduce the peritectic decomposition temperature of pure Bi-2212 by approximately 15-20∼C. Scanning electron microscopy (SEM) and optical microscopy on polished top and cross-sections revealed that the volume fraction of Bi-free phases was lower in the Bi-added specimens relative to those based on pore Bi-2212. In addition, it appeared that the Bi-added samples had improved grain alignment, which was confirmed by x-ray diffraction analysis. Magnetic hysteresis (at 5 K between $\pm$ 5.5 T) and transport measurements (at 4.2 K) were performed on each specimen. These results showed that Bi-additions yielded superior magnetization critical currents, which is attributed to improved grain alignment and reduced secondary phases.

8114 (ANL/ET/CP–84649) **Oxygen stoichiometry and its influence on superconductivity in $Bi_2Sr_2CaCu_2O_{8+x}$.** Krishnaraj, P. (Univ. of Pittsburgh, PA (United States). Dept. of Materials Science and Engineering); Lelovic, M.; Eror, N.G.; Balachandran, U. Argonne National Lab., IL (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9407156–1: Physics and materials science of high-temperature superconductors, Porto Carras (Greece), 10-23 Jul 1994). Order Number DE95004660. Source: OSTI; NTIS; INIS; GPO Dep.

$Bi_2Sr_2CaCu_2O_{8+x}$ (2212) was synthesized from freeze-dried precursors. The oxygen content of 2212 was determined as a function of temperature and oxygen partial pressure and the variation of Tc with oxygen content was determined. It was found that 2212 without excess oxygen (x = 0) is superconducting. This points to the role of the $(Bi\text{-}O)_\infty$ layers as a source for holes in 2212. Four probe resistivity measurements were also performed on 2212. The nature of oxygen intercalation and oxygen removal in 2212 was studied by thermogravimetry and resistivity. It was also found that samples of 2212 with the same oxygen content had different T_c's depending on thermal history. This difference in $T_c$is thought to arise from oxygen occupying different sites in the lattice while maintaining the same total oxygen content.

8115 (ANL/ET/CP–84861) **Cooling rate effects on the microstructure, critical current density, and $T_c$transition of one- and two-powder BSCCO-2223 Ag-sheathed tapes.** Parrell, J.A. (Univ. of Wisconsin, Madison, WI (United States). Applied Superconductivity Center and Materials Science Program); Larbalestier, D.C.; Dorris, S.E. Argonne National Lab., IL (United States). Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract W-31109-ENG-38. (CONF-941013–20: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95004639. Source: OSTI; NTIS; GPO Dep.

An important variable controlling the critical current density (J_c) of Ag-sheathed BSCCO-2223 tapes is the degree of phase purity of the reacted tapes. Most correlations between J_c and microstructure show that it is highly desirable to reduce the amount of non-superconducting second phases to as low a level as practical. In recent studies of the influence of cooling rate after the final reaction, we find contradictions to this general rule. The J_c (77 K, 0 T) of so-called "one-powder" tapes can be raised by as much as 50% (from ~8,000 A/cm^2 to 12,000 A/cm^2) by slow cooling in 7.5%O_2 at 0.05°C/min, even though large 2212 grains are usually seen in the slowly cooled microstructure. However, the higher J_c of the slow-cooled state does correlate with a sharper T_c transition. Experiments with "two-powder" tapes have produced similar results. These apparently anomalous results emphasize the important role played by the connectivity of the polycrystalline core in determining J_c.

8116 (ANL/ET/PP–80280) **Zone refining of sintered, microwave-derived YBCO superconductors.** Warrier, K.G.K. (CSIR, Trivandrum (India). Regional Research Lab.); Varma, H.K.; Mani, T.V.; Damodaran, A.D.; Balachandran, U. Argonne National Lab., IL (United States). Jul 1993. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004657. Source: OSTI; NTIS; INIS; GPO Dep.

Post-sintering treatments such as zone melting under thermal gradient has been conducted on sintered YBCO tape cast films. YBCO precursor powder was derived through decomposition of a mixture of nitrates of cations in a microwave oven for ≈4 min. The resulting powder was characterized and made into thin sheets by tape casting and then sintered at 945 C for 5 h. The sintered tapes were subjected to repeated zone refining operations at relatively high speeds of ≈30 mm/h. A microstructure having uniformly oriented grains in the a-b plane throughout the bulk of the sample was obtained by three repeated zone refining operations. Details of precursor preparation, microwave processing and its advantages, zone refining conditions, and microstructural features are presented in this paper.

8117 (ANL/MSD/CP–84398) **Device-quality tunnel junctions on the high $T_c$superconductor $HgBa_2CuO_{4+\delta}$.** Zasadzinski, J. (Illinois Institute of Technology, Chicago, IL (United States)); Chen, J.; Romano, P.; Gray, K.E.; Wagner, J.L.; Hinks, D.G. Argonne National Lab., IL (United States). [1995]. 14p. (CONF-940926–3: 7. conference on superconductivity and applications, Buffalo, NY (United States), 7-9 Sep 1994). Order Number DE95004646. Source: OSTI; NTIS; INIS; GPO Dep.

SIN and SIS tunnel junction devices (e.g. photon detectors, logic elements) require quasiparticle characteristics that exhibit sharp current onsets at the gap voltage and very low sub-gap conductances. Progress is reported on the development of such junctions on High Tc cuprates using mechanical point contacts. In general, these contacts display the optimum characteristics that can be obtained from HTS native-surface tunnel barriers. Most cuprates display a sub-gap conductance which monotonically increases with voltage about the minimum value at zero bias. However, tunneling data of unusually high quality have been obtained for the recently discovered Hg-based cuprate, $HgBa_2CuO_4$ (T_c=96K). SIS′ tunneling data using a Nb tip are presented which exhibit very low and flat sub-gap conductances and sharp conductance peaks as expected from a BCS density of states. These results are slightly improved over earlier published results with SIN junctions. Use of the experimental data to simulate the performance of a quasiparticle mixer

demonstrates that noise temperatures approaching the quantum limit are possible for SIS and SIN mixers in the range 1-5 THz.

8118 (ANL/MSD/CP–84413) **Processing of single- and multi-domain $YBa_2Cu_3O_x$ bulk materials for levitation applications by $Nd_{1+x}Ba_{2-x}Cu_3O_y$ seeding.** Todt, V.R. (Argonne National Lab., IL (United States)); Sengupta, S.; Miller, D.J. Argonne National Lab., IL (United States). [1995]. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940926–4: 7. conference on superconductivity and applications, Buffalo, NY (United States), 7-9 Sep 1994). Order Number DE95004615. Source: OSTI; NTIS; INIS; GPO Dep.

Melt processing of $YBa_2Cu_3O_x$ (Y123) is a well established technique to produce materials for levitation applications. We report our new results on the melt-processing of Y123. To achieve materials with high levitation forces we utilize a seeding technique using $Nd_{1+x}Ba_{2-x}Cu_3O_y$ seeds (Nd123). Two different kinds of Nd13-seeds, one plate-shaped and the other cube-shaped, were developed and used for this study. The microstructures of the levitators depended strongly on the type of the seeding material used and on the seeding geometry. We were able to produce large single domains as well as materials containing five domains with three different c-axis orientations. Levitation forces up to 8.2 N for samples with a diameter of about 18 mm were found for the multi-domain samples, which is well within the area of the levitation forces measured for the single domain materials.

8119 (BNL–60429) **The real structure of columnar pinning centers in heavy-ion-irradiated cuprate superconductors.** Welch, D.O. (Brookhaven National Lab., Upton, NY (United States)); Zhu, Y.; Budhani, R.C. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941014–2: Topical conference on the critical state in superconductors, Honolulu, HI (United States), 24-26 Oct 1994). Order Number DE95003948. Source: OSTI; NTIS; INIS; GPO Dep.

There has been considerable recent interest in the use of columnar defects produced by irradiation with energetic heavy ions to raise the irreversibility line and improve the critical current density of cuprate superconductors. In the interpretation and theoretical modeling of the flux-pinning characteristics of heavy-ion tracks, it is generally assumed that they are simply columns of non-superconducting material. In this paper we present a more realistic description, based both on resistivity measurements and on detailed, quantitative transmission electron microscope methods (both imaging and analytical studies), of the nature of heavy-ion damage, including defects, disorder, strain fields, and oxygen deficiencies in the matrix of the superconductor surrounding the amorphous columns. The presence of such disorder appears to be a consequence of the mechanism of track formation, which involves partial epitaxial regrowth of a molten region which follows the passage of sufficiently energetic ions.

8120 (DOE/ER/45427–5) **Midwest Superconductivity Consortium: 1994 Progress report.** Purdue Univ., Lafayette, IN (United States). Jan 1995. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER45427. Order Number DE95005796. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Midwest Superconductivity Consortium, MISCON, is to advance the science and understanding of high T_c superconductivity. During the past year, 27 projects produced over 123 talks and 139 publications. Group activities and interactions involved 2 MISCON group meetings (held in August and January); with the second MISCON Workshop held in August; 13 external speakers; 79 collaborations (with universities, industry, Federal laboratories, and foreign research centers); and 48 exchanges of samples and/or measurements. Research achievements this past year focused on understanding the effects of processing phenomena on structure-property interrelationships and the fundamental nature of transport properties in high-temperature superconductors.

8125 (KAERI/RR–1355/93) **Development of Hi-Tech ceramics fabrication technologies -Development of advanced nuclear materials-.** Kang, Thae Kap (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Park, Ji Youn; Kim, Sun Jae; Kim, Kyong Ho; Jung, Choong Hwan; Oh, Seok Jin. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 233p. (In Korean). Order Number DE95612247. Source: OSTI; NTIS; INIS.

The objective of the present work is to prepare the foundation of hi-tech ceramics fabrication technologies through developing important processes i.e., tape casting, sol-gel, single crystal growing, compacting and sintering, and grinding and machining processes. Tape casting process is essential to manufacture hard and functional thin plates and structural elements for some composite materials. For the fabrication of spherical mono-sized micropowders of oxides, sol-gel process has widely been used. Piezoelectric elements that are the core parts of the sensors of LPMS (loose part monitoring system) and ALMS (acoustic leakage monitoring system) are used in single crystal forms. Compacting and sintering processes are general methods for fabricating structural parts using powders. Grinding and machining processes are important to

achieve the final dimensions and surface properties of the parts. (Author).

8126 (KFK–5377) **Long-term safety of radioactive waste disposal: Reaction of high burnup spent fuel and UO_2 in saline brines at room temperature.** Grambow, B.; Loida, A.; Dressler, P.; Geckeis, H.; Diaz, P.; Gago, J.; Casas, I.; Pablo, J. de; Gimenez, J.; Torrero, M.E. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Nukleare Entsorgungstechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Heisse Chemie. Aug 1994. 58p. Contract CEC F12W-0055. Order Number DE95738047. Source: OSTI; NTIS (US Sales Only); INIS.

In order to determine the long-term performance of spent fuel during direct disposal, high burnup fuel (50 MWd/kg U) has been exposed for 500 days to non-buffered saline solutions and to deionized water under static, anaerobic conditions at 25 C. In the absence of saturation effects (large solution volumes) a dissolution rate of 0,3% p.a. has been measured. Under more realistic conditions of large sample surface areas and small solution volumes, reaction rates were found to be orders of magnitude lower. The pH values remained neutral to slightly alkaline. Radiolysis did not lead to an oxidation of the solution. The releases of Sr90, Tc99, Np237 and Sb125 were controlled by the rate of dissolution of the fuel matrix, whereas the solution concentrations of U, Pu, Am and REE were governed by sorption and solubility effects. In the presence of iron, radiolytically produced oxygen has been consumed by iron corrosion and sorption on iron corrosion products effectively reduced the solution concentrations of most radionuclides. Studies of the corrosion of unirradiated UO_2 have shown strong indications for the formation of U(IV) hydroxide. Under oxidizing conditions, only in few cases solubility limits were reached. In the determination of UO_2 corrosion rates one has to distinguish between the initial fast process of dissolving an oxidized surface layer of $UO_{2.6}$ and the process of dissolution of the uranium dioxide beneath and the formation of a new layer of $UO_{2.4}$. Under anaerobic conditions reaction rates were significantly lower than under oxidizing conditions. (orig.)

Dissertation submitted by James M. McHale Jr. to Temple Univ. Graduate Board, Philadelphia, PA (US).

Conventional solid state reactions are diffusion limited processes that require high temperatures and long reaction times to reach completion. In this work, several solution based methods were utilized to circumvent this diffusion limited reaction and achieve product formation at lower temperatures. The solution methods studied all have the common goal of trapping the homogeneity inherent in a solution and transferring this homogeneity to the solid state, thereby creating a solid atomic mixture of reactants. These atomic mixtures can yield solid state products through diffusionless mechanisms. The effectiveness of atomic mixtures in solid state synthesis was tested on three classes of materials, varying in complexity. A procedure was invented for obtaining the highly water soluble salt, titanyl nitrate, $TiO(NO_3)_2$, in crystalline form, which allowed the production of titanate materials by freeze drying. The freeze drying procedures yielded phase pure, nanocrystalline $BaTiO_3$ and the complete SYNROC-B phase assemblage after ten minute heat treatments at 600 C and 1,100 C, respectively. Two novel methods were developed for the solution based synthesis of $Ba_2YCu_3O_{7-x}$ and $Bi_2Sr_2Ca_2Cu_3O_{10}$. Thin and thick films of $Ba_2YCu_3O_{7-x}$ and $Bi_2Sr_2Ca_2Cu_3O_{10}$ were synthesized by an atmospheric pressure, chemical vapor deposition technique. Liquid ammonia solutions of metal nitrates were atomized with a stream of N_2O and ignited with a hydrogen/oxygen torch. The resulting flame was used to coat a substrate with superconducting material. Bulk powders of $Ba_2YCu_3O_{7-x}$ and $Bi_2Sr_2Ca_2Cu_3O_{10}$ were synthesized through a novel acetate glass method. The materials prepared were characterized by XRD, TEM, SEM, TGA, DTA, magnetic susceptibility and electrical resistivity measurements.

8128 (LUTKDH-TKOO–1015) **Zeolites - a high resolution electron microscopy study.** Alfredsson, V. Lund Univ. (Sweden). Dept. of Inorganic Chemistry 2. Oct 1994. 48p. Order Number DE95612250. Source: OSTI; NTIS; INIS.

High resolution transmission electron microscopy (HRTEM) has been used to investigate a number of zeolites (EMT, FAU, LTL, MFI and MOR) and a member of the mesoporous M41S family. The electron optical artefact, manifested as a dark spot in the projected centre of the large zeolite channels, caused by insufficient transfer of certain reflections in the objective lens has been explained. The artefact severely hinders observation of materials confined in the zeolite channels and cavities. It is shown how to circumvent the artefact problem and how to image confined materials in spite of disturbance caused by the artefact. Image processing by means of a Wiener filter has been applied for removal of the artefact. The detailed surface structure of FAU has been investigated. Comparison of experimental micrographs with images simulated using different surface models indicates that the surface can be terminated in different ways depending on synthesis methods. The dealuminated form of FAU (USY) is covered by an amorphous region. Platinum incorporated in FAU has a preponderance to aggregate in the (111) twin planes, probably due to a local difference in cage structure with more spacious cages. It is shown that platinum is intra-zeolitic as opposed to being located on the external surface of the zeolite crystal. This could be deduced from tomography of ultra-thin sections among observations. HRTEM studies of the mesoporous MCM-41 show that the pores have a hexagonal shape and also supports the mechanistic model proposed which involves a cooperative formation of a mesophase including the silicate species as well as the surfactant. 66 refs, 24 figs.

8129 **Method of fabricating silicon carbide coatings on graphite surfaces.** Varacalle, D.J. Jr.; Herman, H.; Burchell, T.D. 1992. Filed date 10 Dec 1992. U.S. Patent Application 7-988,598. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95006117. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The vacuum plasma spray process produces well-bonded, dense, stress-free coatings for a variety of materials on a wide range of substrates. The process is used in many industries to provide for the excellent wear, corrosion resistance, and high temperature behavior of the fabricated coatings. In this application, silicon metal is deposited on graphite. This invention discloses the optimum processing parameters for as-sprayed coating qualities. The method also discloses the effect of thermal cycling on silicon samples in an inert helium atmosphere at about 1600°C which transforms the coating to silicon carbide.

8130 (SAND–94-2056C) **Feasibility of ceramic joining with high energy electron beams.** Turman, B.N. (Sandia National Labs., Albuquerque, NM (United States)); Glass, S.J.; Halbleib, J.A.; Helmich, D.R.; Loehman, R.E.; Clifford, J.R. Sandia National Labs., Albuquerque, NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950129–1: 19. annual conference on advanced ceramics, materials and structures, Cocoa Beach, FL (United States), 9-12 Jan 1995). Order Number DE95004519. Source: OSTI; NTIS; INIS; GPO Dep.

Joining structural ceramics is possible using high melting point metals such as Mo and Pt that are heated with a high energy electron beam, with the potential for producing joints with high temperature capability. A 10 MeV electron beam can penetrate through 1 cm of ceramic, offering the possibility of buried interface joining. Because of transient heating and the lower heat capacity of the metal relative to the ceramic, a pulsed high power beam has the potential for melting the metal without decomposing or melting the adjacent ceramic. The authors have demonstrated the feasibility of the process with a series of 10 MeV, 1 kW electron beam experiments. Shear strengths up to 28 NTa have been measured for Si_3N_4-Mo-Si_3N_4. These modest strengths are due to beam non-uniformity and the limited area of bonding. The bonding mechanism appears to be a thin silicide reaction layer. Si_3N_4-Si_3N_4 joints with no metal layer were also produced, apparently bonded an yttrium apatite grain boundary phase.

8131 (SAND–94-2617C) **Reduction in fiber damage thresholds due to static fatigue.** Setchell, R.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410155–1: 26. annual symposium on optical materials for high power lasers: Boulder damage symposium, Boulder, CO (United States), 24-26 Oct 1994). Order Number DE95004778. Source: OSTI; NTIS; GPO Dep.

Damage mechanisms may occur during the transmission of Q-switched, Nd/YAG laser pulses through fused silica fibers. Fiber end-face characteristics, laser characteristics, and aspects of the laser-to-fiber injection typically determine dominant damage mechanisms. However, an additional damage process has been observed at internal sites where fibers were experiencing significant local stresses due to fixturing or bends in the fiber path. A transmission reduction prior to damage was typically not measurable at these sites. Damage would not always occur during initial testing, but sometimes occurred later in time at laser levels that previously had been transmitted without damage. In these cases the time at stress appeared to be more important than the number of transmitted shots prior to damage. A possible relation between internal damage thresholds at stressed sites and the total time under stress is suggested by the fact that silica fibers experience static fatigue processes. These processes involve the slow growth of local defects under tensile stress at rates that depend upon environmental conditions. Defects reaching sufficient size and having appropriate location could be sites for reduced laser-induced damage thresholds. The present work looks into the possibility that static fatigue processes can affect damage thresholds. The experiments used a laser injection and fiber routing configuration that produced significantly elevated fluences within fiber core regions under tensile stress. In order to establish initial strength and fatigue properties for these fibers, a number of samples were used to generate time-to-failure data at various stress levels. Other fiber samples were subjected to conditions that greatly accelerated fatigue processes. Internal damage thresholds were then measured in these fibers and compared to thresholds measured in fresh fibers. Conclusive comparisons were frustrated by sample-to-sample and lot-to-lot variations in fiber defects.

8132 (UM-P–93/93) **Ion implantation and thermal stress resistance of ceramics.** Gurarie, V.N. (Melbourne Univ., Parkville, VIC (Australia). School of Physics); Wiliams, J.S.; Watt, A.J. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 15p. Order Number DE95615349. Source: OSTI; NTIS (US Sales Only); INIS.

Monocrystals of sapphire and magnesia together with glass samples have been subjected to ion implantation prior to thermal shock testing in a plasma of continuously varied intensity. Measurements of the gap between adjacent fragments have been used to estimate the surface temperature. Fracture and deformation characteristics of the surface layer are measured in ion implanted and unimplanted samples using optical and scanning electron microscopy. Ion implantation is shown to modify the near-surface structure of ceramic samples by introducing damage, which makes crack initiation easier under thermal stresses in sapphire and magnesia crystals. The fracture threshold and maximum crack density are shifted towards the lower temperature range. Ion implanted MgO crystals show a ten fold increase in surface crack density. An increased crack density results in a decreased degree of damage characterised by the depth of crack penetration. The thermal stress resistance parameter of glass samples is increased at relatively small doses and decreased at higher doses. The results suggest that crack density and the degree of fracture damage in brittle ceramics operating under thermal shock conditions can be effectively controlled by ion implantation which provides crack initiating defects in the near-surface region. 22 refs., 8 figs.

8133 (UM-P–93/98) **Crystallization of sol-gel derived lead zirconate titanate thin films in argon and oxygen atmospheres.** Bursill, L.A. (Melbourne Univ., Parkville, VIC (Australia). School of Physics); Brooks, K.G. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 27p. Order Number DE95615230. Source: OSTI; NTIS (US Sales Only); INIS.

Electron diffraction and high-resolution electron microscopic techniques are applied to reveal the mechanisms of crystallization of 75 nm thin films of ferroelectric lead-zirconate-titanate (PZT). Sol-gel methods, followed by pyrolysis at 350 deg C, were used to provide a common starting point after which a variety of rapid-thermal annealing (RTA) experiments in the temperature range 400-700 deg C were made in argon, oxygen and nitrogen/hydrogen atmospheres. The results are interpreted in terms of the crystal chemical analysis, which points out that partial pressure of oxygen and heating rate are important experimental parameters which must be controlled if ferroelectric perovskite-type Pb_2ZrTiO_6, rather than pyrochlore-type Pb_2ZrTiO_{6+x}, where $O < X < 1$ or $-1 < X < O$, is to be obtained after the RTA step. Thus significant improvements in the crystallization of perovskite-type PZT were clearly demonstrated by using argon atmospheres for the RTA step. The results have significance for the production of high-quality ferroelectric thin films, with improved switching and fatigue characteristics, since even small amounts of the pyrochlore phase prove detrimental for these properties. 18 refs., 1 tab., 10 figs.

8134 (UM-P–94/27) **Synthesis of carbo-nitride films using high-energy shock plasma deposition.** Gurarie, V.N.; Orlov, A.V.; Nugent, K.W.; Weiser, P.; Prawer, S. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 6p. Order Number DE95615231. Source: OSTI; NTIS (US Sales Only); INIS.

Recent investigations shows that an enhanced nitrogen content of carbo-nitride films improves wear resistance, hardness, tribological and other properties of these films. The present work reports on the properties of nitrogen rich carbon films produced by an intense gas discharge between carbon electrodes in a nitrogen atmosphere. The energy of the discharge, initial nitrogen pressure, number of discharges and geometry are varied to establish their effect on the nitrogen content and the mechanical, structural and morphological characteristics of the deposited carbon-nitride films. The structural diagnostics include optical and scanning electron microscopy, as well as Auger and Raman Spectroscopes and Rutherford Backscattering. The C-N films formed fell into two categories, differing in morphology and mechanical properties. Type I are C-N films, containing up to 35 at. % nitrogen, and which have an amorphous structure. These films are formed at relatively low plasma shock pressure and exhibit relatively low microhardness, ≈ 2 GPa. In a relatively narrow range of the plasma shock pressure and temperature the second type of C-N deposition is observed consisting of high density, closely-packed crystal-like grains growing perpendicular to the substrate surface and displaying a cauliflower-like morphology. The microhardness of these films reaches 15 GPa, as measured by the Vickers method. 14 refs., 7 figs.

8135 (UM-P–94/39) **Orientation of rapid thermally annealed lead zirconate titanate thin films on (111) Pt substrate.** Brooks, K.G. (Ecole Polytechnique Federale, Lausanne (Switzerland)); Reaney, I.M.; Klissurska, R.; Huang, Y.; Bursill, L.A.; Setter, N. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 45p. Order Number DE95615232. Source: OSTI; NTIS (US Sales Only); INIS.

The nucleation, growth and orientation of lead zirconate titanate thin films prepared from organometallic precursor solutions by spin coating on (111) oriented platinum substrates and crystallized by rapid thermal annealing was investigated. The effects of pyrolysis temperature, post-pyrolysis thermal treatments, excess lead addition, and Nb dopant substitution are reported. The use of post pyrolysis oxygen anneals at temperatures in the regime of 350-450 deg C was found to strongly effect the kinetics of subsequent amorphous-pyrochlore perovskite crystallization by rapid thermal annealing. It has also allowed films of reproducible microstructure and textures (both (100) and (111)) to be prepared by rapid thermal annealing. It is suggested that such anneals and pyrolysis temperature affect the oxygen concentration/average Pb valence in the amorphous films prior to annealing. The changes in Pb valence state then affect the stability of the transient pyrochlore phase and thus the kinetics of perovskite crystallization. Nb dopant was also found to influence the crystallization kinetics. 28 refs., 18 figs.

^{27}Al Nuclear Magnetic Resonance (NMR) measurements from aluminum powders and consolidated nanophase aluminum made from those powders are presented. The signals from the metal and surface oxidation are easily separated and are compared before and after consolidation. The results presented indicate that the oxide coating becomes the interface region within the nanophase composite material and that during consolidation the metal has undergone a deformation equivalent to that seen for bulk material under a compressive strain of between 4% and 8%.

8137 (DOE/CE/15613–T3) **Wear resistant composite structure of vitreous carbon containing convoluted fibers.** Burton, R.G. Burton Technologies, Inc., Raleigh, NC (United States). 1 Feb 1995. 33p. Very good friction and wear measurements are reported for MRCC (metal reinforced carbon composites), made from low-wear non-graphitic carbon matrix with metal-fiber reinforcement. Counterfaces include austenitic and martensitic stainless steels, Si nitride, and alumina. Effects of high load, high temperature, and gaseous environments are reported: removal of humidity, atm. oxygen have little effect on friction, wear for MRCC sliding against ceramic or stainless steel. Wear of Al oxide riders on MRCC is very low, not affected by contact load. 260 C temperatures do not degrade performance of 440-C riders on MRCC disks or raise friction. In small or large sizes, MRCC is made in a single-pass process for about the same volume cost as cast iron. It can survive heating in nitrogen above 1600 C without loss of integrity or major change of dimensions.

Progress report, November 10, 1993–June 10, 1994.** State Univ. of New York, Stony Brook, NY (United States). Research Foundation. [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-86ER45237. Order Number DE95004448. Source: OSTI; NTIS; INIS; GPO Dep.

During this reporting period, the authors group has been active in five areas of research: (1) improvements on their x-ray instrumentation at the SUNY Beamline, National Synchrotron Light Source (NSLS) so that they can perform new experiments which are not accessible otherwise; (2) characterization of functionalized hairy rod polymers designed for studying the macromolecular structures in molecular composites; (3) investigation of supramolecular ordered systems composed mainly of block copolymers from dilute to concentrated solutions, including the gel state; (4) evolution of crystalline structures in polymer blends and melts; and (5) multiphase structure of segment polyurethanes.

8139 (DOE/ID/12779–3) **Development of novel active transport membrande devices.** Laciak, D.V. Air Products and Chemicals, Inc., Allentown, PA (United States). Nov 1994. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC36-89ID12779. Order Number DE95002658. Source: OSTI; NTIS; GPO Dep.

Air Products has undertaken a research program to fabricate and evaluate gas separation membranes based upon promising "active-transport" (AT) materials recently developed in our laboratories. Active Transport materials are ionic polymers and molten salts which undergo reversible interaction or reaction with ammonia and carbon dioxide. The materials are useful for separating these gases from mixtures with hydrogen. Moreover, AT membranes have the unique property of possessing high permeability towards ammnonia and carbon dioxide but low permeability towards hydrogen and can thus be used to permeate these components from a gas stream while retaining hydrogen at high pressure.

8140 (DOE/PC/93225–4) **High performance materials in coal conversion utilization. Technical progress report, July 1–September 30, 1994.** Tennessee Univ., Tullahoma, TN (United States). Space Inst. Oct 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93225. Order Number DE95005199. Source: OSTI; NTIS; GPO Dep.

The object of this grant is to test, analyze, and improve the elevated temperature and coal-slag corrosion resistance of a SiC_p/Al_2O_3 ceramic composite tubular material. The material will be evaluated for its ability to withstand the high pressures and elevated temperature corrosion attack encountered in a coal-fired high-temperature, high pressure air heater. The evaluation will include strength testing at elevated temperatures. In addition, the feasibility of several joining and coating techniques for enhancing the performance of ceramic tubes will also be investigated. Preliminary results are presented for some of the materials characterization tests.

8141 (DOE/R5/51901–T4) **Float zone silicon sheet growth. Quarterly technical progress report No. 5, October 1, 1994–December 31, 1994.** Bleil, C.E. Energy Materials Research, Rochester Hills, MI (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG45-93R551901. Order Number DE95005119. Source: OSTI; NTIS; GPO Dep.

During this quarter, equipment for the production of silicon sheets was tested and assembled. Specifically, tasks 4,7, and 8 from the initial proposal were addressed.

8142 (KFK–5371) **Strength and elastic properties of some graphites, carbon/carbon and SiC/SiC composite materials.** Zimmermann, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Materialforschung; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Kernfusion. Aug 1994. 21p. (In German). Order Number DE95738118. Source: OSTI; NTIS (US Sales Only).

The ultimate bending strengths and the Young's moduli of some graphites, carbon/carbon and SiC/SiC composites have been measured. For most of the composite materials also the shear strength was determined. The material most thoroughly investigated in three directions was Sepcarb N112, a three dimensional CC composite. For the composite materials investigated the bending strength decreases with increasing number of the directions of reinforcement whereas the shear strength increases. (orig.)

8143 (ORNL/Sub–87-SA946C/04) **Investigation of properties and performance of ceramic composite components. Final report on Phase 2.** Curtin, W.A. (Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States)); Reifsnider, K.L.; Oleksuk, L.L.S.; Stinchcomb, W.W. Oak Ridge National Lab., TN (United States); Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). 31 Oct 1994. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Subcontract 19X-SA946C. Order Number DE95004737. Source: OSTI; NTIS; GPO Dep.

The purpose of Phase 2 of the Investigation of Properties and Performance of Ceramic Composite Components has been to build on and extend the work completed during Phase 1 to further advance the transition from properties of ceramic composite materials to performance of ceramic composite components used in fossil energy environments. The specific tasks of Phase 2 were: (1) develop and validate reliable and accurate high temperature, biaxial mechanical tests methods for structural ceramic composite components; (2) test and evaluate ceramic composite components, specifically tubes; (3) characterize long-term, mechanical performance of ceramic composite tubes at high temperatures; (4) develop a fundamental understanding of the mechanical degradation and performance limitations of ceramic composite components

under service conditions; (5) develop predictive models for damage tolerance and reliability; and (6) relate component performance to microstructure and, thereby, provide feedback to the associated process-development effort, to improve performance. Accomplishments for each task are given.

8144 (PNL-SA–25425) **Temperature and dose dependence of metal colloid production in alpha-irradiated CaF_2.** Weber, W.J.; Exarhos, G.J.; Wang, L.M. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941144–26: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004907. Source: OSTI; NTIS; INIS; GPO Dep.

Single crystals of CaF_2 were irradiated with 5.8 MeV alpha particles from a ^{244}Cm source. The absorbance spectra were recorded as a function of dose and temperature. At low doses, the absorbance from the colloid band increased with dose to saturation values that changed with temperature. The colloid band exhibited a sharp increase in rate of growth over a narrow temperature range with a peak at 150°C. The intensity of the colloid band after a dose of 1.4 x 1016 a/cm^2 is a factor of 7 to 8 higher than the intensity at 100 and 200°C. The temperature (150°C) for the maximum rate of colloid growth in CaF_2 under the alpha irradiation conditions ($\sim 5 \times 10^8$ rad/h) of this study is significantly higher than the peak temperature (60°C) reported for colloid production in CaF_2 under electron irradiation at slightly higher dose rates ($\sim 10^9$ rad/h). Cryogenic transmission electron microscopy of the irradiated crystals revealed dislocation loops and small dark clusters as the dominant microstructural features.

8145 (SAND–94-1653C) **Non-destructive characterization of porous silicon using X-ray reflectivity.** Chason, E.; Guilinger, T.R.; Kelly, M.J.; Headley, T.J.; Howard, A.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–24: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004766. Source: OSTI; NTIS; GPO Dep.

Understanding the evolution of porous silicon (PS) layers at the early stages of growth is important for determining the mechanism of PS film growth and controlling the film properties. We have used X-ray reflectivity (XRR) to determine the evolution of layer thickness and interfacial roughness during the growth of thin PS layers (< 200 mn) prepared by electrochemical anodization. The porous layer grows at a constant rate for films as thin as 15 mn indicating a very short incubation period during which the surface may be electropolished before the PS structure begins to form. Interface roughness measurements indicate that the top surface of the film remains relatively smooth during growth while the roughness of the PS/silicon interface increases only slightly with film thickness. The XRR results are compared with results obtained from the same films by cross-sectional transmission electron microscopy (XTEM), atomic force microscopy (AFM) and gravimetry.

8146 (SAND–94-1692C) **High surface area, high permeability carbon monoliths.** Lagasse, R.R. (Sandia National Labs., Albuquerque, NM (United States). Organic Materials Processing Dept.); Schroeder, J.L. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States);Gas Research Inst., Chicago, IL (United States). DOE Contract AC04-94AL85000. Contract 5091-260-2228. (CONF-941144–23: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004555. Source: OSTI; NTIS; GPO Dep.

The goal of this work is to prepare carbon monoliths having precisely tailored pore size distribution. Prior studies have demonstrated that poly(acrylonitrile) can be processed into a precursor having tailored macropore structure. Since the macropores were preserved during pyrolysis, this synthetic process provided a route to porous carbon having macropores with size =0.1 to 10μm. No micropores of size <2 nm could be detected in the carbon, however, by nitrogen adsorption. In the present work, the authors have processed a different polymer, poly(vinylidene chloride) into a macroporous precursor, Pyrolysis produced carbon monoliths having macropores derived from the polymer precursor as well as extensive microporosity produced during the pyrolysis of the polymer. One of these carbons had BET surface area of 1,050 m^2/g and about 1.2 cc/g total pore volume, with about 1/3 of the total pore volume in micropores and the remainder in 1μm macropores. No mesopores in the intermediate size range could be detected by nitrogen adsorption. Carbon materials having high surface area as well as micron size pores have potential applications as electrodes for double layer supercapacitors containing liquid electrolyte, or as efficient media for performing chemical separations.

8147 (SAND–94-1703C) **Effect of He pressure on the superconducting transition temperatures of Na_2CsC_{60} and $(NH_3)_4Na_2CsC_{60}$.** Schirber, J.E. (Sandia National Labs., Albuquerque, NM (United States)); Bayless, W.R.; Rosseinsky, M.J.; Zhou, O.; Fleming, R.M.; Murphy, D.; Fischer, J.E. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–33: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95006320. Source: OSTI; NTIS; INIS; GPO Dep.

The Na based mixed alkali doped C_{60} superconductors show anomalous behavior with respect to the "universal" superconducting transition temperature $T_c$vs lattice constant a_0 relation followed by most of the fcc A_3C_{60} superconductors. We have measured dt_c/dP for Na_2CsC_{60} and $(NH_3)_4Na_2CsC_{60}$ using solid He as the pressure medium to $\sim$ 6 kbar finding dT_c/dP equal to $-0.8\pm(0.01)$ K/kbar and $-1.0(\pm0.1)$K/kbar for Na_2CsC_{60} and $Na_2(NH_3)_4C_{60}$ respectively. Our value for Na_2CsC_{60} differs markedly from that obtained by Mizuki et al of about -1.3 K/kbar. However, using N_2 or Ar, we obtain values for dT_c/dP in substantial agreement with Mizuki et al who used fluorinert to generate their pressure. This work emphasizes the need for compressibility measurements with the same pressure medium in the appropriate temperature range so that meaningful comparisons can be made between various pressure measurements and models which are based on lattic spacing.

8148 (SAND–94-2831C) **Microporous polyimide films for reduced dielectric applications.** Saunders, R.S.; Aubert, J.H.; McNamara, W.F. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941142–27: American Society of Mechanical Engineers' winter annual meeting, Chicago, IL (United States), 9-11 Nov 1994). Order Number DE95004543. Source: OSTI; NTIS; GPO Dep.

With all the advances in the microelectronics industry, a limiting factor to computer chip speed and size is becoming the dielectric constant of the interlayer insulating materials. Dielectric constants of these layers have been reduced in going from inorganic to organic type materials. A further reduction in dielectric constant, coupled with better mechanical properties are still required for these types of materials. The authors have developed a technique involving spincoating in conjunction with a thermodynamic process called "Non-solvent Induced Phase Separation" (NSIPS) to create microporous polyimide films that exhibit both a lower dielectric constant and better stress reduction properties compared to their solid film counterparts. In this technique, the authors spincoat a soluble polyimide solution in 1,3-dimethoxybenzene solvent onto a silicon wafer, and then immediately submerse the "wet" polymer film into a non-solvent bath, typically toluene. Phase separation of the polymer occurs on a micron size scale and the resulting microporous structure becomes locked in by the high glass transition temperature of the polyimide. The authors have determined the factors affecting the film morphology, thickness, pore size, and percent porosity; these factors include the polymer concentration, spin speed, and the type of non-solvent used. The different morphologies obtained for the varying non-solvents are explained in terms of thermodynamics and kinetics of phase separation and diffusion, using an idealized ternary phase diagram. One particular film having a porosity of 68%, thickness of 22 microns and pore size of 1.4 microns had a measured dielectric constant of 1.88 and dielectric loss of 0.002. Stress measurements indicated that the microporous

film reduced surface stress on the wafer by more than a factor of 10 when compared to the analogous solid polyimide film.

8149 (SAND–94-2944C) **Particle transport in plasma reactors.** Rader, D.J. (Sandia National Labs., Albuquerque, NM (United States)); Geller, A.S.; Choi, Seung J.; Kushner, M.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410132–4: Microcontamination '94, San Jose, CA (United States), 5-6 Oct 1994). Order Number DE95004541. Source: OSTI; NTIS; GPO Dep.

SEMATECH and the Department of Energy have established a Contamination Free Manufacturing Research Center (CFMRC) located at Sandia National Laboratories. One of the programs underway at the CFMRC is directed towards defect reduction in semiconductor process reactors by the application of computational modeling. The goal is to use fluid, thermal, plasma, and particle transport models to identify process conditions and tool designs that reduce the deposition rate of particles on wafers. The program is directed toward defect reduction in specific manufacturing tools, although some model development is undertaken when needed. The need to produce quantifiable improvements in tool defect performance requires the close cooperation among Sandia, universities, SEMATECH, SEMATECH member companies, and equipment manufacturers. Currently, both plasma (e.g., etch, PECVD) and nonplasma tools (e.g., LPCVD, rinse tanks) are being worked on under this program. In this paper the authors summarize their recent efforts to reduce particle deposition on wafers during plasma-based semiconductor manufacturing.

8150 (SLAC–450) **A photoemission study of the diamond and the single crystal C_{60}.** Wu, Jin. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Mar 1994. 104p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (SLAC/SSRL–0089). Order Number DE95006149. Source: OSTI; NTIS; INIS; GPO Dep.

This report studied the elctronic structure of diamond (100) and diamond/metal interface and C_{60}, using angle-resolved and core level photoemission. The C(100)-(2X1) surface electronic structure was studied using both core level and angle resolved valence band photoemission spectroscopy. The surface component of the C 1s core level spectrum agrees with theoretical existence of only symmetrical dimers. In the case of metal/diamond interfaces, core level and valence photoelectron spectroscopy and LEED studies WERE MADE OF B and Sb on diamond (100) and (111) surfaces. In the case of single-crystal C_{60}, photoemission spectra show sharp molecular features, indicating that the molecular orbitals are relatively undisturbed in solid C_{60}.

8151 (UM-P–92/86) **Characterization of { 11-bar 01 } twin dislocation structures in evaporated titanium thin films by HREM.** Kasukabe, Y. (Tohoku Univ., Sendai (Japan). Coll. of General Education); Yamada, Y.; Lin. Pengju; Bursill, L.A. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 16p. Sponsored by Australian Research Council, Canberra, ACT (Australia);Tohoku Univ., Sendai (Japan). Order Number DE95615391. Source: OSTI; NTIS (US Sales Only); INIS.

The structure of {11-bar 01} twin dislocations in Ti films evaporated on NaCl substrates at 250 deg C has been examined and characterised by high-resolution electron microscopy. The results have revealed that a twin dislocation structure with step height 4 x $d(K_1)$, where $d(K_1)$ is the spacing of the {11-bar 01} twin planes, actually dissociates into two {11-bar 01} twin dislocations with step heights of $d(K_1)$ and 3 x $d(K_1)$. The twin dislocation with a step height of 3 x $d(K_1)$ contains an edge dislocation in the core while that with a step height of $d(K_1)$ is a simple classical twin dislocation structure. Twin dislocations with step height of 2 x $d(K_1)$, including an edge dislocation in the core, also occur. The atomic-scale core structures of {11-bar 01} twin dislocations may be derived by analysis of the high-resolution images. The relative mobilities of the three types of twin dislocations is then discussed. 17 refs., 4 figs.

8152 (CNIC–00766) **Determination of micro-amount carbon in sodium metal by vacuum distillation-gas chromatography.** Wen Ximent (Academia Sinica, Beijing, BJ (China). Inst. of Atomic Energy); Guo Qingzhou; Sun Shiping. China Nuclear Information Centre, Beijing, BJ (China). Jun 1993. 10p. (In Chinese). (IAE–0121.). Order Number DE95611763. Source: OSTI; NTIS (US Sales Only); INIS.

The amount of carbon in sodium metal which is used as a coolant of fast reactors has the effect on physical and mechanical properties of construction materials for reactors. A method to determine microamounts carbon in sodium metal by vacuum distillation-gas chromatography in the ppm level has been developed. Under the argon atmosphere, 1 $\approx$ 6 g sodium samples are put into silica crucibles, then crucibles are placed in a stainless steel distillation pot at 673 K and 6.7 x 10^{-3} Pa to remove the sodium. The residue is combusted at 1373 K with pure oxygen for 30 minutes. The CO_2 formed is collected in a silica gel cold trap (193 $\approx$ 173 K) and measured by gas chromatography after disadsorption by boiling water. Many experimental conditions such as distillation, combustion, cold trap, treatment of apparatus and quantitative method have been studied. By this method the relative deviation is less than 12% with the content of carbon in sodium at the range of 5 $\approx$ 100 ppm. Standard addition experiments are carried out with nuclear grade graphite and sodium carbonate standards. Within the above range, the recoveries are (104.9 +- 11.1)% and (100.8 +-19)%, respectively. This method has met the technical requirements for carbon analysis in nuclear grade sodium.

8153 (CNIC–00793) **Study on the extraction of Am^{3+} and rare earth elements with β-oxime extractant (7804) (I).** Hou Ruiqin (Qinghua Univ., Beijing, BJ (China). Inst. of Nuclear Energy Technology); Jiao Rongzhou; Zhu Yongjun. China Nuclear Information Centre, Beijing, BJ (China). Nov 1993. 8p. (In Chinese). (TSHUNE–0071.). Order Number DE95611881. Source: OSTI; NTIS (US Sales Only); INIS.

The influences of equilibrium time, temperature, pH value, extractant concentration and feed concentration on the distribution of Am^{3+} and rare earth elements have been studied in the extraction with β-oxime extractant 7804. It was found that the optimum extraction equilibrium time is 30 min; temperature is 20 +- 1 degree C; extractant concentration is 0.2 mol/L and the pH is from 4.8 to 5.1. Under these experimental conditions, 7804 forms 2:1 complex with Am^{3+} or rare earth elements. The extractability sequence shows is Am>Eu>Sm>Nd>Pr>Ce>La.

8154 (DOE/MC/29109–3979) **Road Transportable Analytical Laboratory (RTAL) system. Quarterly progress report, August 1994–October 1994.** Department of Energy, Morgantown, WV (United States). Morgantown Energy Technology Center. 15 Dec 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29109. Order Number DE95006208. Source: OSTI; NTIS; GPO Dep.

Goal is to develop and demonstrate a system for rapid, accurate analysis of a wide variety of hazardous and radioactive contaminants in soil, groundwater, and surface waters. More specifically, a road- transportable, fully independent laboratory system for on-site analyses is desired, for assisting DOE cleanup and remediation efforts. This report documents progress during the first quarterly period of Phase II. The RTAL system will be integrated into ECO's existing TERMM and TERMM modular systems.

The growing development in the industry has an important contribution to the environmental damage, where the natural effluents are each day more contaminated by toxic elements, such as: mercury, chromium, lead and cadmium. So as to separate such elements it has sorbent must have enough stability, and have a sharp capacity of sorption. In this work it was studied the sorption behavior of cobalt and on the other hand, cadmium in aqueous solutions, which along with sodic form of the Zeolite X, undergoes a phenomenon of ionic interchange. Such interchange was verify to different concentration of cadmium, cobalt and hydronium ion. The content of cobalt and sodium in the interchanged samples was detected through the neutronic activation analysis. The results disclose a higher selectivity for cadmium than cobalt. (Author).

The distribution of heavy metals (Cr, Zr, Nb, Mo, Sb, Ba, Pb), As and I over the technological fractions in the process of brown coal burning has been studied by the method of instrumental gamma-activation analysis (IGAA) using a microtron braking gamma radiation. It is shown that the employment of a microtron for IGAA allows up to 50 elements be determined in coal and its burning products with a detection limit of 10^{-6} to 10^{-9} g/g. 2 refs., 1 fig., 1 tab.

8168 (JINR-D–15-93-80, pp. 112-113) **Hydrogen content determination in alkali metals.** Teterev, Yu.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 119p. (In Russian). (CONF-9209490–: Workshop on application of microtrons in nuclear physics, Plovdiv (Bulgaria), 22-24 Sep 1992). In *Microtron MT-25. Workshop on application of microtrons in nuclear physics.* Order Number DE95611718. Source: OSTI; NTIS (US Sales Only); INIS.

A nuclear technique of hydrogen determination in alkali metals is described. It is based on sample irradiation with epithermal neutrons passed through a resonance filter. Neutrons scattered on nuclei of the substance under study were registered with a resonance detector. Due to an improved design of the analytical set-up and an increased statistics of measurement, detection limit of hydrogen in lithium and its alloys reached a value of 2×10^{-4} g/g. 2 refs.

8169 (KAERI/RR–1231/92) **Development of atomic spectroscopy technology.** Lee, Jong Min (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Cha, Hyung Ki; Song, Kyu Seok; Yang, Ki Ho; Baik, Dae Hyun; Lee, Young Joo; Yi, Jong Hoon; Jeong, Do Young; Jeong, Eui Chang; Yoo, Byung Duk; Cha, Byung Heon; Kim, Seong Ho; Nam,.Korea Cancer Center Hospital, Seoul (Korea, Republic of). This project is aimed for the 'Development of extraction and separation techniques for stable isotopes by atomic laser spectroscopy technique'. The project is devided by two sub-projects. One is the 'Development of the selective photoionization technology' and the other is 'Development of ultrasensitive spectroscopic analysis technololgy'. This year studies on Hg and Yb, both of which have 7 isotopes, have been performed and, as a result, it was proved that specific isotopes of these elements could be selectively extracted. In addition study on plasma extraction technique, development of atomizers, design of electron gun have been the result of the project in 1992. In second sub-project trace determination of Pb has been performed with laser resonance ionization spectroscopy. As a result 20 picogram of detection limit has been obtained. In addition to these results, design of high sensitive laser induced fluorescence detection system as well as remote sensing DIAL system have been done. (Author).

8170 (KAERI/RR–1241/93) **A study on the treatment of industrial wastewater containing heavy metals.** Yoon, Myoung Hwan (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Jang, In Soon; Park, Jang Jin; Choi, Chang Shik; Lee, Yoon Hwan; Shin, Jin Myoung. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jun 1993. 89p. (In Korean). Order Number DE95611776. Source: OSTI; NTIS; INIS.

It is essential to treat heavy metals contained in industrial wastewater safely and economically for the protection of the environment. An effective method of separating heavy metals using acornic acid for the first time in the world must be utilized for wastewater treatment. One of the merits of this method lies in its cheap treatment cost. Furthermore, the secondary contamination, which occurs often when chemical purifiers are used, could be minimized. Another advantage of utilizing the acornic acid is that various kinds of heavy metals contained in industrial wastewater can be purified at once. The final purpose of this project is to commercialize the method by 1994. (Auther).

8171 (KAERI/RR–1264/93) **Development on the technology for tritium removal processes (II).** Sung, Ki Woung (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Kim, Yong Eak; Na, Jung Won; Jung, Yong Won; Ku, Che Hyu; Kim, Kwang Rag; Chung, Hoong Suck; Lee, Han Soo; Pack, Soong Woo; Kang, Hee Suk; Kim, You Sun; Cho, Young Hyun; Ahn, Do.Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 114p. (In Korean). Order Number DE95611777. Source: OSTI; NTIS; INIS.

In order to decrease tritium exposure to workers, the ratio of which is up to 40% of total exposure, tritium removal facility is getting to be one of the considerable parameters in Korea, due to the next CANDUs to be operated at Wolsung NPP. For investigating the column characteristics of cryogenic distillation of H_2/D_2 system, a preliminary distillation apparatus for Ar/N_2 distillation was designed and manufactured. It consisted of a distillation column (20 mm diameter, 500 mm height), a reboiler and a condenser, surrounded with a liquid nitrogen jacket and a vacuum insulating box. Several kinds of packing materials including Dixon ring will be tested. Computer simulation showed that the reaching time for steady-state was approximately 20 minutes, while the concentration ratio between the top and the lower art was around 2000. (Author).

8172 **Tetraethyl orthosilicate-based glass composition and method.** Wicks, G.G.; Livingston, R.R.; Baylor, L.C.; Whitaker, M.J.; O'Rourke, P.E. To Dept. of Energy. 1992. Filed date 31 Dec 1992. U.S. Patent Application 7-999,338. 39p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006113. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Disclosed is a tetraethyl orthosilicate-based, sol-gel glass composition with idditives selected for various applications. The composition is made by mixing ethanol, water, and tetraethyl orthosilicate, adjusting the pH into the acid range, and aging the mixture at room temperature. The additives, such as an optical indicator, filler, or catalyst, is then added to the mixture to form the composition which can be applied to a substrate before curing. If the additive is an indicator, the light-absorbing characteristics of which vary upon contact with a particular analyte, the indicator can be applied to a lens, optical fiber, reagant strip, or flow cell for use in chemical analysis. Alternatively, an additive such as alumina particles is blended into the mixture to form a filler composition for patching cracks in metal, glass, or ceramic piping.

8173 (PINSTECH-HPD–142) **ICP-MS as advantageous analytical technique for the determination of long-lived ^{99}Tc in the environment.** Ihsanullah (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Health Physics Div.). Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Health Physics Div. May 1992. 14p. Order Number DE95614628. Source: OSTI; NTIS (US Sales Only); INIS.

Technetium (Tc) was the first artificially created by man and has no stable isotope. The most crucial technetium isotope environmentally ^{99}Tc is a pure beta emitter with a half-life of 2.1 X 105 years. The main source of ^{99}Tc to the environment is the disposal of liquid wastes from nuclear installations or during separation and recovery of spent nuclear fuels. Because of its long half life, high fission yield, mobility and current interest in the collective long term doses, it is necessary to establish a knowledge of the behavior of ^{99}Tc in the environment for complete assessment of the impact of nuclear industry. Due to various analytical difficulties however, data on the behavior of Tc in the environment are limited. In the literature, many techniques are reported for the analysis of Tc. A very sensitive, precise and powerful technique is required which can be applied to environmental samples in order to gain information by obtaining more precise data to assess the impact of Tc releases on man. Attention has been focussed for this purpose on a new powerful technique i.e. inductively coupled plasma mass spectrometry (ICP-MS). This report has been directed towards the development of ICP-MS. The technique gives a very high sensitivity enabling long lived radionuclides including ^{99}Tc to be measured directly down to pg ml-1 levels in solution. Because of its versatility ICP-MS is finding applications for trace multielement analysis and low detection limits in almost all fields. (author).

8174 (PINSTECH-RIAD–138) **Standardization of $^{13}CO_2$ production procedure from organic matter for mass spectrometric analysis.** Sajjad, M.I. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Radiation and Isotope Application Div.); Latif, Z.; Tasneem, M.A.; Ali, M.; Bilal, R. Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan). Radiation and Isotope Application Div. Nov 1993. 16p. Order Number DE95614629. Source: OSTI; NTIS (US Sales Only); INIS.

This report summarizes the ways and means by which $^{13}Co_2$ production procedure from organic matter can be standardized. Optimum sample preparation conditions were determined to get reproducible results. Plant combustion for six minutes at 900-1000 degree C with pure O_2 and ten minutes for conversion of CO to CO_2 over CUO gauze at 850 degree C have been found optimum conditions. Internal standards: PINSTECH wheat straw, PINSTECH grass sample, Glucose-D glaxo PINSTECH and polyethylene foil PINSTECH were selected, and calibrated against IAEA Sucrose and polyethylene foil standards. These internal standards have been used for correction of delta 13 C results. The mechanisms for the correction of results has been described. Causes of isotope fractionation of plant samples were determined. Statistical summary of measured results for delta ^{13}C standards has also been given. (author).

8175 (SAND–94-3147C) **The effect of O_2 intercalation on the rotational dynamics and the ordering transition of C_{60}.** Myers, S.A.; Assink, R.A.; Schirber, J.E.; Loy, D.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–27: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95004765. Source: OSTI; NTIS; GPO Dep.

We have used ^{13}C magic-angle spinning (MAS) nuclear magnetic resonance (NMR) to characterize the structure and rotational dynamics of C_{60} containing oxygen molecules located in the interstitial sites of the fcc lattice. Under normal conditions, a narrow peak at 143.7 ppm is observed for C_{60}. When exposed to oxygen at moderate pressures, several additional resonances appear in the ^{13}C MAS NMR spectrum. These secondary resonances are shifted downfield from the main peak at 143.7 ppm and are due to the Fermi-contact interaction of the paramagnetic oxygen molecules with the ^{13}C nuclear spins. The presence of oxygen depresses the orientational ordering transition by ca. 20 K as observed by DSC. The spin-lattice relaxation time (T_1) of each secondary peak shows a minimum near the ordering transition, indicating that this transition is not dependent on the number of oxygen molecules surrounding an individual C_{60} molecule. The T_1, due to paramagnetic relaxation, normalized by the number of surrounding oxygen molecules, is constant. This observation demonstrates that within a given sample, the dynamics of C_{60} molecules are independent of the number of surrounding oxygen molecules.

8176 (SAND–94-8251) **Recipes for high resolution time-of-flight detectors.** Anz, S.J. (Univ. of California, Los Angeles, CA (United States)); Felter, T.E.; Hess, B.V.; Daley, R.S.; Roberts, M.L.; Williams, R.S. Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95006196. Source: OSTI; NTIS; GPO Dep.

The authors discuss the dynamics, construction, implementation and benefits of a time-of-flight (TOF) detector with count rates an order of magnitude higher and resolution three to four times better than that obtainable with a surface barrier detector. The propose use of design criteria for a time-of-flight detector is outlined, and the determination of a TOF detector's total relative timing error and how this value determines the mass resolution are illustrated using a graphical analysis. They present simulation and experimental examples employing light ions and discuss advantages and pitfalls of medium-energy heavy ion TOF spectrometry.

8177 (SVF–523) **De-aeration of feedwater by membrane-technique.** Hellman, M.H. (Ingenjoersfirma Mats H Hellman, Haegersten, (Sweden)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Dec 1994. 23p. (In Swedish). Order Number DE95737676. Source: OSTI; NTIS.

District heating systems and boilers should to be fed with de-aerated water to prevent corrosion. The water can be de-aerated chemically or thermally by heating with hot water or steam. Society's increased environmental consciousness demands that industry reduce the use of chemicals. A DOR plant for de-aeration of feedwater to the district heating system has been installed for evaluation at the district heating plant in Mora. The DOR plant is build on a so-called DOR membrane concept (Dissolved Oxygen Removing) that uses a vacuum system and no chemicals. This report describes the evaluation of the DOR plant. The test show that the DOR plant can produce water with a very low oxygen content. The deciding factor for how low the oxygen content will be depends on the capacity of the vacuum pump. The temperature of the water is also very important. The lower the temperature the less the oxygen content. It was impossible to establish the lowest possible oxygen content as the vacuum pump began to cavitate at a pressure of 30-40 mbar. During the test the lowest oxygen content of 9 μg O_2/kg at 15 degrees C was achieved. However at this level the pump cavitated seriously. By connecting an ejector in front of the vacuum pump it is possible to decrease the pressure to 10 mbar without cavitation. A realistic result at normal condition with a pressure of 20 mbar and a water temperature of 15 degrees C would be 10-20 μg O_2/kg or even lower. A plant with a DOR membrane is an interesting alternative for de-aeration of feedwater in plants without access to steam. The equipment is easy to handle and requires a minimum of maintenance. 3 refs, 9 figs, 1 tab

8178 (WHC-SD-TD-RPT–010) **Detection and quantitative analysis of ferrocyanide and ferricyanide: FY 93 Florida State University Raman spectroscopy report.** Mann, C.K. (Florida State Univ., Tallahassee, FL (United States). Dept. of Chemistry); Vickers, T.J. Westinghouse Hanford Co., Richland, WA (United States). 11 Oct 1994. 192p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002365. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a summary of work to develop and investigate the feasibility of using Raman spectroscopy with tank waste materials. It contains Raman spectra from organics, such as ethylenediaminetetraacetic acid (EDTA), hydroxyethylenediaminetetraacteic acid (HEDTA), imino diacetic acid (IDA), kerosene, tributyl phosphate (TBP), acetone and butanol, anticipated to be present in tank wastes and spectra from T-107 real and BY-104 simulant materials. The results of investigating Raman for determining moisture content in tank materials are also presented. A description of software algorithms developed to process Raman spectra from a dispersive grating spectrometer system and an in initial design for a data base to support qualitative and quantitative application of remote Raman sensing with tank wastes.

Summaries are given on the technical progress on three tasks of this project. Monomer and polymer synthesis discusses the preparation of 1(7-aminoheptyloxymethyl)naphthalene and poly(maleic anhydride-alt-ethyl vinyl ether). Task 2, Characterization of molecular structure, discusses terpolymer solution preparation, UV analysis, fluorescence analysis, low angle laser light scattering, and viscometry. The paper discusses the effects of hydrophobic groups, the effect of pH, the effect of electrolyte addition, and photophysical studies. Task 3, Solution properties, describes the factorial experimental design for characterizing polymer solutions by light scattering, the light scattering test model, orthogonal factorial test design, linear regression in coded space, confidence level for coded space test mode coefficients, coefficients of the real space test model, and surface analysis of the model equations.

8181 (DOE/ER/14227–3) **Generation, detection and characterization of gas-phase transition metal aggregates and compounds. Final technical report, September 15, 1991–July 14, 1994.** Steimle, T.C. Arizona State Univ., Tempe, AZ (United States). Dept. of Chemistry and Biochemistry. 12 Nov 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER14227. The goal of this research project has been to identify and characterize small gas-phase metal containing molecules and relate these properties to proposed reaction mechanisms. Of particular emphasis has been the elucidation of the mechanism for activation of C-H, N-H, S-H, and C-C bonds in CH_4, HCCH, H_2S and NH_3 by platinum, titanium, molybdenum, and niobium.

8182 (DOE/PC/92545–8) **Fischer Tropsch synthesis in supercritical fluids. Quarterly technical progress report, July 1, 1994–September 30, 1994.** Akgerman, A.; Bukur, D.B. Texas A and M Univ., College Station, TX (United States). Dept. of Chemical Engineering. [1995]. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92545. Order Number DE95005206. Source: OSTI; NTIS; GPO Dep.

In pursuit of the diffusion coefficients of Fischer-Tropsch products in supercritical fluids, the objectives for this quarter were to continue the work on effective density measurements. Some data were to be obtained and calculations of effective diffusivities were to be made. Once the effective diffusivity is known, then also knowing the molecular diffusivity, the tortuosity factor can be obtained. The porosity has been determined from independent experiments. Knowing the tortuosity and the porosity the only property that is needed to back calculate the effective diffusivity in a wide range of reactor conditions is the molecular diffusivity at those reaction conditions.

Inst., Taejon (Korea, Republic of)); Shin, Yeong Joon; Lee, Il Hee; Yang, Han Beom; Kim, Kwang Uk; Jeong, Dong Yong; Lim, Jae Kwan; Lee, Won Kyeong; Kim, Won Ho; Kim, Eung Ho; Kim, Yeong Hwan; Kwon, Seon Kil; HwangKorea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 385p. (In Korean). Order Number DE95611876. Source: OSTI; NTIS; INIS.

This study has been focused on the development of an indigenous partitioning process by modifying and complementing the reported processes. First of all, we tried to approach several unit separation processes in order to identify their adoptability to the partitioning of long-lived radionuclides. There are several unit separation methods - adsorption, precipitation, ion exchange, and solvent extraction etc. which are often used in ore processing or metal purification processes. With the unit processes chosen in this study, the following experiments have been carried out to provide technical facts necessary to develop a partitioning process. (1) Removal of a small amount of uranium by extraction with TBP from simulated waste solution (2) Destruction of nitric acid by use of formic acid (3) Co-precipitation of minor actinides and lanthanides. (4) Partitioning of minor actinides and lanthanides by extraction with HDEHP (5) Partitioning of minor actinides and lanthanides by ion exchange.

8189 (KAERI/RR–1384/93) **A study on the treatment of industrial wastewater containing heavy metals.** Yoon, Myung Hwan (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Chang, In Soon; Park, Jang Jin; Lee, Yoon Hwan; Shin, Jin Myung. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Aug 1994. 106p. (In Korean). Order Number DE95612704. Source: OSTI; NTIS; INIS.

In order to practically use the acornic acid process for treating heavy metal contained wastewater, the pilot plant of 2.4 ton (wastewater)/day capacity was designed, constructed and operated. An electroplating wastewater originated from a company was treated with NaOH, acornic acid (60 ppm) and salt (1000 ppm) in this pilot plant. The COD, Cr, Fe and Zn cocentrations of treated water were 123, 0.08, 0.05 and 0.08 ppm, respectively. These values were all satisfied with the legal effluent limits. (Author).

8190 **ADMPT and its synthesis.** Coburn, M.D.; Ott, D.G. To Dept. of Energy. 1992. Filed date 24 Nov 1992. U.S. Patent Application 7-980,888. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006104. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is 3-amino-6-(3,5-dimethylpyrazol-1-y1)-1,2,4,5-tetrazine (compound 8, ADMPT) and a method of making it. Triaminoguanidine monohydrochloride (compound 1) in water solution is combined with 2,4-pentanedione (compound 2) to form a precipitate comprised of 3,6-bis(3,5-dimethylpyrazol-1-y1)-1,2-dihydro-1,2,4,5-tetrazine (compound 3). A mixture of compound 3 in a suitable solvent is contacted with nitric oxide (NO) or nitrogen dioxide (NO_2) to form 3,6-bis(3,5-dimethylpyrazol-1-y1)-1,2,4,5-tetrazine (compound 4). The NO or NO_2 is then removed from the mixture by passing an inert gas through the mixture or, alternatively, compound 4 is separated from the mixture and mixed with fresh solvent to form a mixture free of NO and NO_2. The mixture is contacted with ammonia (NH_3) at a temperature less than about 35 C to form compound 8 and 3,5-dimethyl-1H-pyrazole (compound 7). A preferred solvent for the oxidation is 1-methyl-2-pyrrolidinone (NMP) and for the ammonolysis is toluene.

8191 (PNL-SA–24552) **Small angle X-ray scattering studies of aggregation in supercritical fluid solutions.** Fulton, J.L.; Pfund, D.M. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9410114–4: 3. international symposium on supercritical fluids, Strasbourg (France), 17-19 Oct 1994). Order Number DE95004576. Source: OSTI; NTIS; GPO Dep.

Small-angle X-ray scattering (SAXS) can be used to derive structural information on molecular aggregates having sizes from 2 to 200 nm. Not only is the technique useful for probing fluid structure in pure and simple binary supercritical fluid systems, but the technique is also well suited to investigate a range of much more complex multi-molecular aggregates that form when surfactants are added to supercritical fluids. The authors describe the experimental apparatus that was constructed for these studies and the experimental approach used to collect the scattering data. They present scattering results for pure fluids and for fluids containing various types of microemulsion phases, including reverse micelle and normal micelle phases. These results demonstrate that SAXS is a powerful technique for probing various types of molecular aggregation in supercritical fluid solutions.

8192 (PNL-SA–25345) **A solubility model for amorphous silica in concentrated electrolytes.** Felmy, A.R.; Schroeder, C.C.; Mason, M.J. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940813–33: 208. American Chemical Society national meeting, Washington, DC (United States), 21-26 Aug 1994). Order Number DE95004896. Source: OSTI; NTIS; GPO Dep.

Silica is one of the major constituents of the earth's crust and is ubiquitously present in most natural materials. The solubility of silica and other silica-containing compounds is, therefore, of primary concern in geochemistry and in chemical processing applications where silica scale formation, resulting from changes in temperature and electrolyte composition, can cause problems in process design and operation. This paper describes the development of an aqueous thermodynamic model for accurately predicting the solubility of amorphous silica and other silica-containing compounds in the system Na^+-H^+-Mg^{2+}-NO_3^--SO_4^{2-}-Cl^--H_2O to high concentration and across the temperature range 25–100 C. This model, which utilizes the aqueous thermodynamic model of Pitzer, includes only one dissolved silica species, H_4SiO_4(aq), and is valid in neutral to very acidic solutions. The model is parameterized from the extensive set of solubility data in the literature as well as from new experimental data on amorphous silica solubility in HNO_3 and HCl developed as part of this study. The accuracy of the model is tested on solutions more complex than those used in model parameterization.

8193 (SAND–94-1693C) **Disilene Addition to C_{70}.** Jacobs, S.J. (Sandia National Labs., Albuquerque, NM (United States)); Cahill, P.A.; Rohlfing, C.M. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–37: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95006321. Source: OSTI; NTIS; GPO Dep.

Semiempirical and ab initio Hartree Fock computational results indicate that the highly reactive dienophile tetramethyldisilene, $Me_2Si{=}SiMe_2$, is an excellent candidate for a novel functionalization of the equator of C_{70} via a [2+4] cycloaddition to the 21, 22, 23, 42 carbons. Thermal or photochemical generation of tetramethyldisilene in the presence of C_{70} results in similar complex mixtures in which the major product appears to be that of [2+2] cycloaddition to the 7,8 carbons of C_{70}. A minor product clearly results from [2+2] cycloaddition to the 1,9 carbons. Both of these products are hydrolytically unstable and are converted nonspecifically to mixtures of 1,9- and 7,8-$C_{70}H_2$ which are also present in HPLC traces of the reaction mixtures.

8194 (SAND–94-3183C) **Synthesis and characterization of FE colloid catalysts in inverse micelle solutions.** Martino, A. (Sandia National Labs., Albuquerque, NM (United States)); Sault, A.G.; Kawola, J.S.; Stoker, M.; Hicks, M.; Bartholomew, C.H. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950402–2: 209. American Chemical Society national meeting, Anaheim, CA (United States), 2-7 Apr 1995). Order Number DE95006313. Source: OSTI; NTIS; GPO Dep.

Formation of Fe clusters in inverse micelles was studied. Iron salts are solubilized within the polar interior of inverse micelles, and addition of $LiBH_4$ initiates reduction to produce monodisperse, nanometer-sized Fe based particles. The reaction sequence is sustained by material exchange between inverse micelles. Surfactant interface provides a spatial constraint on reaction volume, and reactions carried out in these micro-heterogeneous solutions produce colloidal sized particles (10–100 Å) stabilized in solution against flocculation by surfactant. In this paper, the clusters were characterized using TEM, Moessbauer spectroscopy, electron diffraction, and x-ray photoelectron spectroscopy.

8195 (SKB-TR–94-10) **Project Caesium - An ion exchange model for the prediction of distribution coefficients of caesium in bentonite.** Wanner, H. (MBT Umwelttechnik AG, Zuerich (Switzerland)); Wieland, E.; Albinsson, Y. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jun 1994. 44p. Order Number DE95611797. Source: OSTI; NTIS; INIS.

A surface chemical model is established to thermodynamically describe caesium sorption on bentonite. Caesium sorption is studied on Wyoming bentonite MX-80 in solutions of NaCl, KCl, $MgCl_2$, $CaCl_2$, $NaNO_3$ and $Ca(NO_3)_2$ of concentrations varying between 0.025M and 1M, as well as in the weakly saline Allard groundwater and the strongly saline Aespoe groundwater. Based on these experiments it is shown that the sorption behaviour of caesium on bentonite can be described, within the experimental and model uncertainties, in terms of a one-site ion exchange model. The ion exchange constant for the replacement of Na^+ on montmorillonite by Cs^+ is $\log K_{ex}$ degrees = 1.6. The model predictions compare well with sorption data published in the open literature on both Wyoming bentonite MX-80 and other types of bentonite. For the analysis of diffusion experiments in compacted bentonite, the apparent diffusivity of tritiated water, HTO, is used as an analogue to estimate the pore diffusivity of Cs^+. Since insufficient information is available at present to estimate the porosity actually available for diffusion in compacted bentonite, it is assumed that the diffusion porosity can be approximated by using the value of the bulk porosity. Under these circumstances, the cation ex change capacity (CEC) found to be available for the diffusing species in compacted bentonite corresponds to about 12% of the total CEC of bentonite. It is recognised that the errors made in the estimation of the pore diffusivity and of the diffusion porosity are contained in the reduction factor of the CEC. A discussion of the factors affecting the diffusivities of radionuclides and the problem of establishing consistent sets of diffusivity data is given in the Appendix. 33 refs, 7 figs, 12 tabs.

8196 (ANL/CHM/CP–84392) **Time-resolved EPR studies of the H atom: A stable heavy isotope of muonium.** Bartels, D.M. Argonne National Lab., IL (United States). 4 Oct 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9406294–1: Royal Society/CIBA foundation meeting on trends in muonium chemistry, London (United Kingdom), 10 Jun 1994). Order Number DE95004614. Source: OSTI; NTIS; INIS; GPO Dep.

Muonium physicists and chemists, when they talk about "primary processes," are probably concerned mostly about end-of-track phenomena in the slowing down of a many-MeV charged particle, analogous to the proton. The author's experience is with electron accelerators and radiolysis; hence, he will comment briefly on the differences and relative advantages of electron and proton radiolysis for the study of H atoms, as opposed to muonium. Then, he will take the liberty of defining primary processes to include the recombination reactions that may occur between geminate or quasi-geminate free radicals within radiolysis spurs.

8197 (ANL/CHM/PP–82180) **Pulse radiolysis of alkanes: A time-resolved electron paramagnetic resonance study.** Shkrob, I.A. (Argonne National Lab., IL (United States). Chemistry Division); Trifunac, A.D. Argonne National Lab., IL (United States). 14 Feb 1994. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95005831. Source: OSTI; NTIS; INIS; GPO Dep.

Time-resolved spin-echo-detected electron paramagnetic resonance (EPR) was applied to examine short-lived alkyl radicals formed in pulse radiolysis of liquid alkanes. It was found that the ratio of yields of penultimate and interior radicals in n-alkanes at the instant of their generation is temperature-independent and is ca. 1.25 times greater than the statistical quantity. This higher-than-statistical production of penultimate radicals indicates that the fast ion molecule reactions involving radical cations are a significant route of radical generation. The analysis of spin-echo kinetics in n-alkanes suggests that the alkyl radicals are emissively polarized in spur reactions. this initial polarization rapidly increases with shortening of the aliphatic chain. Another finding is that a long-chain structure of these radicals results in much higher rate of Heisenberg spin exchange relative to the recombination rate. The relative yields of hydrogen abstraction and fragmentation for various branched alkanes are estimated. It is concluded that the fragmentation occurs prior to the formation of radicals in an excited precursor species. Effects of phenolic and alkene additives in radiolysis of n-alkanes are examined. It is demonstrated that phenoxy radicals are produced in dissociative capture of electrons and alkane holes. Another route is a reaction of phenols with free hydrogen atoms. A rapid transfer of singlet correlation from the geminate radical ion pairs is responsible for unusual polarization patterns in the phenoxy and cyclohexadienyl radicals. The significance of these results in the context of cross-linking in polyethylene and higher paraffins is discussed. 56 refs.

Studies of the influence of solvent composition on electron mobility, μ_e, which we reported for mixtures of neopentane (NP) and tetramethysilane (TMS) were extended to mixtures of TMS with isooctane (i-octane) or cyclohexane (c-hexane). Whereas our initial TMS /NP study focused on an electron transport regime in which μ_e varied only from 67 cm^2/Vs in NP to 100 cm^2/Vs in TMS, the more recent studies extended to values of μ_e of 7.5 and 0.22 cm^2/Vs in i-octane and c-hexane, respectively. Whereas a linear dependence of log μ_e on solvent composition had been found in earlier studies of electron transport in mixtures, a negative deviation from this dependence was found in TMS/NP mixtures. In contrast, a positive deviation from linearity was observed in TMS/c-hexane mixtures. Despite the markedly different dependences of μ_e on solvent composition for these mixtures, the observed dependences are consistent with the percolation model of electron transport that Schiller has developed.

Progress in 1993–94 was focused on delineating how ions of the model nonpolar spherical solute Buckminsterfullerene interact differently with various nonpolar solvents than does the ellipsoidal fullerene analog C-70, and exposing a variety of new audiences to the electrophilicity-carcinogenicity relationship in order to obtain fresh insight into this relationship that may lead to elucidation of the role of electrons in carcinogenesis and thereby a better understanding of the biological effects of ionizing radiation. To achieve these goals a new collaboration was established with scientists at Oak Ridge National Lab who have unique facilities to characterize fullerene and its radiolytic products.

When electrodeposited on SnO_2, $CuInSe_2$ thin films appear as p-type semiconductors. The photoresponse of such semiconductors has been studied in sulphuric acid aqueous solutions, as well as in a (0.1 M H_2SeO_3 + 0.5 M H_2SO_4) aqueous solution. In this latter case, besides the photocurrent response, the formation of a selenium thin film was observed. The results for hydrogen production in the $CuInSe_2$ thin films or in the newly formed phase ($CuInSe_2$ /Se), accordingly, are presented and compared with those obtained with usual metallic electrodes. (Author).

The CN group might have made it appearance in the early stages of chemical evolution, for this reason the radiolytic behavior of nitriles have relevance to the study of prebiotic chemistry. A systematic study of the influence of the irradiation on nitriles and dinitriles have been carried at ICN. In this paper we present the formation of polymeric material from the γ irradiation of aqueous solutions of malonitrile 0.1 M, oxygen free, at their natural ph s. The analysis of the radiolytic product was by exclusion chromatography, some characteristics of the polymer material were found by IR spectroscopy, Biuret test, etc. The results showed that in this system several polymeric materials are formed with a molecular weight about 10,000 daltons. (Author).

In this report the new experimental method for solving the problem of the radical recombination in organic solids is suggested. The act of recombination requires diffusion, encounters and the reaction between radicals. To understand the regularities of the recombination demands independent investigation diffusion and reaction as well. Until now the application of electron spin resonance for investigation of the radical recombination yielded only the dependence of the amount of the radicals N (t) in the sample on time and did not allow to solve the problem of the limiting stage of the recombination process. (Author).

The espectrometric technique of Electron Spin Resonance (ESR) is based in the detection of magnetic centers, a property that free radicals present due to the odd electron. This property has been used for the identification of the irradiated foods. (Author).

8205 (INIS-mf–13801, pp. RC8) **Elimination of organics chemicals in aqueous solutions by gamma radiation processing.** Arzate O, O.; Vazquez A, O.; Moreno A, J. Instituto Nacional de Investigaciones Nucleares, Mexico City (Mexico); Instituto de Investigaciones Electricas, Cuernavaca (Mexico); Universidad Autonoma del Estado de Morelos (UAEM), Cuernavaca (Mexico). 1992. 30p. (CONF-9208272–: 9. Symposium on nuclear chemistry, radiochemistry and radiation chemistry, Cuernavaca (Mexico), 16-21 Aug 1992). In *9. Symposium on nuclear chemistry, radiochemistry and radiation chemistry. Abstracts.* Order Number DE95611878. Source: OSTI; NTIS (US Sales Only); INIS.

The objective this work was to evaluate the gamma radiation processing for elimination of organic contaminants on industrial wastewater. Standard samples with 17 hydrocarbons (acetophenone, anisole, benzene, chlorobenzene, cyclohexanone, N, N-dimethylaniline, phenol, naphtalene, 1-chloronaphtalene, n-octadecane, p-nitrotoluene, toluene, tetrachloroethane, tetramethylbenzene, n-undecane, m-xylene and o-xylene) was preparated in hexane with total concentration of 1 μ g/μ l which was analyzed by gas chromatography. Other sample with the same concentration of these hydrocarbons in acetone was used to contaminate water samples, which were irradiated with gamma radiation from Co-60 between doses 5.0 to 20.0 KGy and dose rate of 1.162 KGy/h. The activity of source was 1470 Ci. Percents destruction of hydrocarbons were: 79.76 % to 5.0 KGy, 85.97 % to 7.5 KGy, 86.24 % to 10.0 KGy, 86.72 % to 12.5 KGy, 88.92 % to 15.0 KGy, 91.74 % to 17.5 KGy and 92.38 % to 20.0 KGy. The conclusion of this paper is that the radiation processing is efficient to eliminate hydrocarbons on aqueous solutions in direct proportion to the processing doses at this dose rate. (Author).

Symposium on nuclear chemistry, radiochemistry and radiation chemistry. Abstracts.* Order Number DE95611878. Source: OSTI; NTIS (US Sales Only); INIS.

Gamma induced grafting in crystalline or vitreous polymers produces a number of polymer radicals which remain trapped in the rigid polymer matrix. Grafting takes place during the diffusion process and it is accomplished as soon as the polymer is swollen upon which the radicals acquire enough mobility to combine among them. Since graft polymerization involves processes such as polymeric free-radicals generation, monomer molecules penetration and incorporation into the polymer matrix, it provides a promising field for the application of the Positron Annihilation Lifetime (PAL) technique. In the present work PAL was applied to the study of the microstructure of the graft copolymer of methyl methacrylate (MMA) onto low-density polyethylene (LDPE). Micrographs were taken along the copolymer formation process which show a characteristic morphology of graft copolymers. Direct method of g-induced graft polymerization was the best technique to carry on the preparation of the MMA/LDPE copolymer. (Author).

This study was carried out for decomposition of tert-butanol which has been called non-biodegradable wastewater by using gamma radiation combined with ozone. When tert-butanol was oxidized by ozone combined with irradiation, a large amount of tert-butanol could be not only easily converted into by-products, such as organic acid, but also oxidized to final products. The irradiation acts an important roll of production of O_2^- radical which is essential in decomposition of tert-butanol. (Author).

Includes viewgraphs.

The TIARA and DISPL2 codes are being developed at Argonne National Laboratory to predict tritium retention and release from lithium ceramics under steady-state and transient conditions, respectively. Emphasis has been placed on tritium behavior in Li_2O because of the selection of this ceramic as a first option for the ITER driver blanket and because of the excellent materials properties data base for Li_2O. In this paper, the results of validation of TIARA to tritium retention data from VOM-15H, EXOTIC-2, and CRITIC-1 are presented, along with predictions of tritium retention in BEATRIX-11. For DISPL2, results are presented for tritium release predictions vs. data for MOZART, CRITIC-1, and BEATRIX-11.

8217 (INIS-mf–14449) **Sorption of radioactive cobalt with sepiolite and erionite.** Bonifacio M, G. Universidad Autonoma Metropolitana, Mexico City (Mexico). 1994. 73p. (In Spanish). Order Number DE95614822. Source: OSTI; NTIS (US Sales Only); INIS.

^{60}Co present in aqueous solutions may be sorbed in clays or zeolites. If the solids are suspended in aqueous solutions, the cations of the solids may be exchanged with $^{60}Co^{2+}$ ions present in the solutions. Natural aluminosilicate are used for separation of radioactive cations which are present in waste liquids from radiochemical laboratories. The natural sepiolite lattice is almost neutral, having a cation exchange capacity in the order of 0.05 meg/g. It is shown that mild treatment with NaOH solution (2M) results in partial substitution by cations present in the natural sepiolite, in the other hand, during treatment with $NaAlO_2$ in a 6N NaOH solution at 90 Centigrade degrees it has been produced an aluminated sepiolite resulting in partial Mg-by-Al substitution in the octahedral layer. The crystallinity of the samples before and after the ion exchange was studied by X-ray diffraction. The aim of this paper is to study the Co^{2+} ion exchange behavior in this aluminosilicate and to compare it with natural mexican erionite. The natural sepiolite from Vallecas, Spain is recommended as ^{60}Co adsorbent. This clay is directly obtained from the mineral field without any treatment. (Author).

In this report we describe the synthesis of the Z (cis) isomers of R-l-azabicyclo [2.2.2] oct-3-yl R-and S-α-hydroxy-α-(liodo-l-propen-3-yl) - α-phenylacetate. We also report the results of the in vitro binding assays of the E and Z isomers of the (R, R)- and (R, S)-isomers of IQNP. The Z isomers of IQNP were prepared by there action of (R, R)- or (R, S)-l-azabicyclo [2.2.2] oct-3-yl - α - hydroxy - α - phenyl - α - (l-propyn-3-yl) acetate with tributyltin hydride in HMPA followed by subsequent reaction of the cis tributylstannyl substrate with iodine. In an attempt to increase the yield of the Z isomers, the preparation of the Z isomers of the R-or S-ethyl α-hydroxy-α-phenyl-α-(l-propyn-3-yl)acetate was also investigated under a variety of reaction conditions. Results of the in vitro binding assays demonstrated that although all the isomers showed high affinity for the muscarinic receptor, the E-(R, R)-IQNP isomer had a 100 times greater higher affinity for m_1 and m_3 receptor subtypes as compared to m_2 subtype. We are currently evaluating the in vivo biodistribution properties and pharmocokinetic and autoradiographic analyses of these promising new ligands in detail for potential use of the iodine-123-labeled agents to study muscarinic receptors by Single Photon Emission Computed Tomography (SPECT).

8219 (STUDSVIK-M–94-86) **Chemistry in water reactors.** Hermansson, H.P.; Norring, K. Studsvik Material AB, Nykoeping (Sweden). 14 Jul 1994. 39p. (In Swedish). Order Number DE95611879. Source: OSTI; NTIS; INIS.

The international conference Chemistry in Water Reactors was arranged in Nice 24-27/04/1994 by the French Nuclear Energy Society. Examples of technical program areas were primary chemistry, operational experience, fundamental studies and new technology. Furthermore there were sessions about radiation field build-up, hydrogen chemistry, electro-chemistry, condensate polishing, decontamination and chemical cleaning. The conference gave the impression that there are some areas that are going to be more important than others during the next few years to come. Cladding integrity: Professor Ishigure from Japan emphasized that cladding integrity is a subject of great concern, especially with respect to waterside corrosion, deposition and release of crud. Chemistry control: The control of the iron/nickel concentration quotient seems to be not as important as previously considered. The future operation of a nuclear power plant is going to require a better control of the water chemistry than achievable today. One example of this is solubility control via regulation in BWR. Trends in USA: means an increasing use of hydrogen, minimization of SCC/IASCC, minimization of radiation fields by thorough chemistry control, guarding fuel integrity by minimization of cladding corrosion and minimization of flow assisted corrosion. Stellite replacement: The search for replacement materials will continue. Secondary side crevice chemistry: Modeling and practical studies are required to increase knowledge about the crevice chemistry and how it develops under plant operation conditions. Inhibitors: Inhibitors for IGSCC and IGA as well for the primary- (zinc) as for the secondary side (Ti) should be studied. The effects and mode of operation of the inhibitors should be documented. Chemical cleaning: of heat transfer surfaces will be an important subject. Prophylactic cleaning at regular intervals could be one mode of operation.

8220 (UCRL-JC–118634) **A higher-order projection method for the simulation of unsteady turbulent nonpremixed combustion in an industrial burner.** Pember, R.B.; Almgren, A.S.; Bell, J.B.; Colella, P.; Howell, L.; Lai, M. Lawrence Livermore National Lab., CA (United States). Dec 1994. 19p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9407160–1: 8. international symposium on transport phenomena in combustion, San Francisco, CA (United States), 16-20 Jul 1994). Order Number DE95005919. Source: OSTI; NTIS; GPO Dep.

The modeling of transient effects in burners is becoming increasingly important. The problem of ensuring the safe performance of an industrial burner, for example, is much more difficult during the startup or shutdown phases of operation. The peak formation of pollutants is also much more dependent on transient behavior, in particular, on peak temperatures, than on average operating conditions. In this paper we present a new methodology for the modeling of unsteady, nonpremixed, reacting flow in industrial burners. The algorithm uses a second-order projection method for unsteady, low-Mach number reacting flow and accounts for species diffusion, convective and radiative heat transfer, viscous transport, turbulence, and chemical kinetics. The time step used by the method is restricted solely by an advective CFL condition. The methodology is applicable only in the low-Mach number regime (M

< .3), typically met in industrial burners. The projection method for low-Mach number reacting flow is an extension of a higher-order projection method for incompressible flow [9, 5, 3,4] to the low-Mach number equations of reacting flow. Our method is based on an approximate projection formulation. Radiative transport is modeled using the discrete ordinates method. The main goal of this work is to introduce and investigate the simulation of burners using a higher-order projection method for low-Mach number combustion. As such, the methodology is applied here only to axisymmetric flow in gas-fired burners for which the boundaries can be aligned with a rectangular grid. The perfect gas law is also assumed. In addition, we use a one-step reduced kinetics mechanism, a $\kappa - \epsilon$ model for turbulent transport, and a simple turbulent combustion model.

8221 (DOE/ER/75671–T1) **Report to the Department of Energy on the DOE/EPSCoR planning activities for the state of South Dakota.** South Dakota State Univ., Brookings, SD (United States). Dept. of Chemistry. Dec 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91ER75671. Order Number DE95004699. Source: OSTI; NTIS; GPO Dep.

An extensive review of the current status of energy-related research and educational activities within the state of South Dakota was carried out. Information exchange meetings were conducted at the major research institutions as well as with many representatives of state government. Visits were also made to professional educators who are deeply involved with the state's principal minority group, the American Indian. Several activities in the human resource development area that will be carried out in the five-year implementation project were identified. Many of these will be closely coordinated with other efforts currently in progress under the auspices of the NSF SSI (Statewide Systemic Initiatives in Science, Mathematics, and Engineering Education) office. The authors will also work closely with AWU and other regional consortia to foster a higher level of participation in existing DOE programs and to develop adaptations and "follow-ons" that are tailored to the specific needs of South Dakota. Many of these programs will involve extensive interaction with DOE laboratories. Special programs will be carried out that are designed to keep a larger number of the Native American population in the science and engineering pipeline. An assessment of the research strengths of this state was made. With the assistance of external consultants, the authors identified two principal areas in which they have the potential to develop nationally competitive research programs that fall within DOE objectives. One is a comprehensive biomass systems study, and the other a water quality study as it relates to energy production.

8222 (SAND–95-0108C) **Failure analysis: Status and future trends.** Anderson, R.E.; Soden, J.M.; Henderson, C.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950117–1: Workshop on semiconductor characterization, Gaithersburg, MD (United States), 30 Jan - 2 feb 1995). Order Number DE95006311. Source: OSTI; NTIS; INIS; GPO Dep.

Failure analysis is a critical element in the integrated circuit manufacturing industry. This paper reviews the changing role of failure analysis and describes major techniques employed in the industry today. Several advanced failure analysis techniques that meet the challenges imposed by advancements in integrated circuit technology are described and their applications are discussed. Future trends in failure analysis needed to keep pace with the continuing advancements in integrated circuit technology are anticipated.

8223 (ANL/RE/PP–80322) **Rocking response of tanks containing two liquids.** Tang, Y. (Argonne National Lab., IL (United States). Reactor Engineering Div.). Argonne National Lab., IL (United States). [1995]. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004598. Source: OSTI; NTIS; GPO Dep.

A study on the dynamic response of upright circular cylindrical liquid-storage tanks containing two different liquids under a rocking base motion with an arbitrary temporal variation is presented. Only rigid tanks were studied. The response quantities examined include the hydrodynamic pressure, sloshing wave height and the associated frequencies, base shear and moments. Each of these response quantities is expressed as the sum of the so-called impulsive component and convective component. Unlike the case of tanks containing one liquid, in which the response is controlled by one parameter, height-to-radius ratio, the response of tanks containing two different liquids are controlled by three parameters: height-to-radius ratio, and mass density ratio and height ratio of the two liquids. The interrelationship of the responses of the tank-liquid system to rocking and lateral base excitations is established by examining numerical results extensively. The study shows that some of the response quantities for tank-liquid system under a rocking base motion can be determined from the available data for the response of an identical tank under a horizontal base motion. Base rocking motion can occur in a ground-supported tank or in an elevated tank under earthquake motions.

8224 (ANL/RE/PP–80379) **Sloshing response of nonuniform density liquid in a laterally excited tank.** Tang, Y. (Argonne National Lab., IL (United States). Reactor Engineering Division). Argonne National Lab., IL (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004589. Source: OSTI; NTIS; GPO Dep.

A study on the sloshing response of nonuniform density liquid in a tank undergoing lateral base excitations is presented. The system considered is a circular cylindrical tank containing a liquid whose density increases with the liquid depth. The density distribution along the depth can be of any arbitrary continuous function. In the analysis, the liquid field is divided into n layers. The thicknesses of the liquid layers can be different, but the density of each liquid layer is considered to be uniform and its value is assigned to be the value of the original liquid density at the mid-height of that layer. The problem is solved by the transfer matrix technique. The effect of the nonuniform liquid density on the sloshing response is illustrated in a numerical example in which the linear and cosine distributions of the liquid density are assumed. The response functions examined include the sloshing frequencies, surface wave height, and the associated convective hydrodynamic pressure. The results are presented in tabular and graphical forms. It is found that the natural frequencies of the sloshing motion for nonuniform density liquid are lower than those of the uniform density liquid of the same total depth contained in an identical tank. Also, it is shown that for nonuniform density liquid, the maximum sloshing wave height may increase significantly and the magnitude of the convective hydrodynamic pressure may be quite different compared with that of a uniform liquid contained in an identical tank.

8225 (BNL–52444) **Dynamic modeling and response of rigid embedded cylinders.** Veletsos, A.S.; Younan, A.H.; Bandyopadhyay, K. Brookhaven National Lab., Upton, NY (United States). Oct 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95006728. Source: OSTI; NTIS; INIS; GPO Dep.

Following a brief review of the limitations of a popular technique for modeling the soil action in analyses of the dynamic response of deeply embedded cylindrical foundations and structures, the sources of the limitations are identified and a modification is proposed which, while retaining the attractiveness of the original model, defines correctly the action of the system. In the proposed approach, the soil medium is modeled by a series of elastically constrained, rather than unconstrained, thin horizontal layers with a circular hole at the center. The impedances of the constrained layers are established and are then used to evaluate the dynamic

response of a rigid vertical cylinder embedded in a uniform viscoelastic stratum of constant thickness and infinite extent in the horizontal direction. The cylinder and the stratum are presumed to be supported on a non-deformable base undergoing a uniform horizontal motion. The effects of both harmonic and earthquake induced ground motions are considered. The response quantities examined include the dynamic force per unit of cylinder height and the corresponding base shear and base moment. The system investigated simulates the design of underground storage tanks at Hanford for the storage of radioactive wastes.

8226 (DOE/EA–0931) **Center for Molecular Electronics, University of Missouri, St. Louis. Environmental Assessment.** USDOE, Washington, DC (United States). Jun 1994. 33p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95002675. Source: OSTI; NTIS; GPO Dep.

The Department of Energy (DOE) proposes to authorize the University of Missouri, St. Louis to proceed with the detailed design and construction of the proposed Center for Molecular Electronics. The proposed Center would consist of laboratories and offices housed in a three-story building on the University campus. The proposed modular laboratories would be adaptable for research activities principally related to physics, chemistry, and electrical engineering. Proposed research would include the development and application of thin-film materials, semi-conductors, electronic sensors and devices, and high-performance polymers. Specific research for the proposed Center has not yet been formulated, therefore, specific procedures for any particular process or study cannot be described at this time. The proposed construction site is an uncontaminated panel of land located on the University campus. This report contains information about the environmental assessment that was performed in accordance with this project.

8227 (EPD-CTG–94-0037) **Nuclear criticality safety evaluation – DWPF Late Wash Facility, Salt Process Cell and Chemical Process Cell.** Williamson, T.G. Westinghouse Savannah River Co., Aiken, SC (United States). 17 Oct 1994. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95004805. Source: OSTI; NTIS; INIS; GPO Dep.

The Savannah River Site (SRS) High Level Nuclear Waste will be vitrified in the Defense Waste Processing Facility (DWPF) for long term storage and disposal. This is a nuclear criticality safety evaluation for the Late Wash Facility (LWF), the Salt Processing Cell (SPC) and the Chemical Processing Cell (CPC). of the DWPF. Waste salt solution is processed in the Tank Farm In-Tank Precipitation (ITP) process and is then further washed in the DWPF Late Wash Facility (LWF) before it is fed to the DWPF Salt Processing Cell. In the Salt Processing Cell the precipitate slurry is processed in the Precipitate Reactor (PR) and the resultant Precipitate Hydrolysis Aqueous (PHA) produce is combined with the sludge feed and frit in the DWPF Chemical Process Cell to produce a melter feed. The waste is finally immobilized in the Melt Cell. Material in the Tank Farm and the ITP and Extended Sludge processes have been shown to be safe against a nuclear criticality by others. The precipitate slurry feed from ITP and the first six batches of sludge feed are safe against a nuclear criticality and this evaluation demonstrates that the processes in the LWF, the SPC and the CPC do not alter the characteristics of the materials to compromise safety.

8228 (FRCEA-TH–409) **Interactive three dimensional simulation for generation of synthetical returns in remote handling assisted by computer.** Even, P. CEA Centre d'Etudes de Fontenay-aux-Roses, 92 (France); Rennes-1 Univ., 35 (France). 19 Oct 1989. 260p. (In French). Order Number DE95612718. Source: OSTI; NTIS (US Sales Only); INIS.

The general theme of this thesis concerns the creation of concepts and methods using the interactive vision by computer to improve a system of remote handling assisted by computer.

8229 (IAEA-TECDOC–769, pp. 69-80) **Application of artificial neural networks for modeling localized corrosion.** Ben-Haim, M. (Israel Atomic Energy Commission, Beersheba (Israel). Nuclear Research Center-Negev); Marelly, M. International Atomic Energy Agency, Vienna (Austria). Oct 1994. (CONF-9310404–: Specialists meeting on current practices and future trends in expert system developments for use in the nuclear industry, Tel Aviv (Israel), 11-15 Oct 1993). In *Current practices and future trends in expert system developments for use in the nuclear industry. Report of a specialists meeting held in Tel Aviv, Israel, 11-15 October 1993.* 147p. Order Number DE95615814. Source: OSTI; NTIS (US Sales Only); INIS.

Artificial neural networks (ANN) were applied to modeling localized corrosion of Incoloy Alloy 825 in simulated J - 13 well water. ANN as a non linear models can represent accurately localized corrosion phenomena caused by an environment containing chlorides, nitrates, fluorides and sulfates at various temperature ranges. Although the nature of the dependent variable of the ANN models, the visual rating of the localized corrosion is qualitative, a good correspondence between the output of the model and the actual indications is determined. Accurate ANN modeling has been carried out by using the visual inspection of the specimen surface, in contrast to linear modeling where in order to get a sound correlation between the system variables, a complex dependent parameter, having no clear physical meaning has been chosen. It has also been found that one can extrapolate to a certain extent, beyond the ability to interpolate (as with linear models). The ANN model predicted with a low relative error the visual rating of the corrosion rate of records which where part of the testing set of the ANN and belonging to the original full factorial design experiment. Thus, such models can be used for detailed analysis procedures as sensitivity, knowledge acquisition and optimization. (author). 7 refs, 9 figs.

8230 (KAERI/RR–1236/92) **The development of advanced robotics for the nuclear industry.** Kim, Seung Ho (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Lee, Jong Min; Kim, Chang Hoi; Kim, Byung Soo; Sohn, Surg Won; Hwoang, Suk Yeoung; Lee, Yong Bum; Kim, Woong Ki; Kim, Tae Ryong; Jung, Seung Ho; Park, Jin Seok; Hwoang, Chang KyueKorea Cancer Center Hospital, Seoul (Korea, Republic of). May 1992. 88p. (In Korean). Order Number DE95612681. Source: OSTI; NTIS; INIS.

This project started in september '92 and will be carried out for three and a half years as its first phase. The two major work scopes of this project consist of developing robotic system for nuclear power plants and developing advanced robotic technology. Conceptual design has been carried out and detailed specifications have been fixed through tremendous data reviewing for a multifunctional robot system. A mobile robot system for inspection and maintenance in nuclear power plants is designed in a modular type to modify easily in the field. Articulated manipulator of 3 degrees of freedom is designed to do the light work in the local work area away from the control station. The design of manipulator has been realized to operate with the 24V battery power. Various aspects of study are performed regarding the development of nozzle dam installation robot. And finally force reflecting master/slave control technique are studied. The-state-of-the-art for vision system applied to robot system is investigated. Stereo vision system has been constructed to enhance efficiency as well as safety when remote manipulation is needed. In order to develop inspection and survey system, object recognition and infrared image observation technique has been studied. Object recongnition system and IR image observation system has been constructed in the hardware. (Author).

8231 (KAERI/RR–1256/93) **Development of laser technology (Development of the wavelength tuning and the output stabilization technology).** Lee, Jong Min (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Cha, Hyung Ki; Kim, Sung Ho; Cha, Byung Hun; Rhee, Yong Joo; Lim, Chang Hwan; Yoo, Byung Duk; Song, Kyu Seok; Choe, An Seong; Baik, Dae Hyun; Kim, Jung Bog; Jeong, Do Young; Jung,Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1992. 132p. (In Korean). Order Number DE95612682. Source: OSTI; NTIS; INIS.

Various types of the dye laser are developed and investigated for the wavelength tuning and the output stabilization. And a Ti:sapphire laser system was developed to expand the lasing frequency and the injection seeding was executed in this Ti:sapphire laser. New frequency tuning mechanism using a wedge prism was developed and it was proved that better fine frequency tuning can be achieved by rotating the wedge prism instead of the tuning mirror. Efficiency and the parameters of the high power dye laser

amplifier system were calculated by the computer simulation. The characteristics of the dye nozzle were examined for the stabilization of the high power, high repetition rate dye laser system and the output characteristics of the dye laser using the nozzle are investigated. (Author).

8232 (KAERI/RR–1271/94) **Development of high power free-electron lasers.** Lee, Jong Min (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Nam, Chang Hee; Lee, Byeong Cheol; Kim, Seon Kook; Jeong, Yeong Uk; Cho, Seong Oh; Choi, Byeong Ho; Choi, Hwa Rim. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jan 1994. 287p. (In Korean). Order Number DE95612683. Source: OSTI; NTIS; INIS.

A millimeter wave free-electron laser driven by electrostatic accelerator has been constructed, and simulation codes were developed. Main components such as high current electron gun, power supply for electron gun, electrostatic accelerator, permanent-magnet undulator and millimeter-wave cavity have been developed. Simulation codes calculating the output power and trajectory of electron beam in undulator have been developed. The energy of the electron beam is 430 keV and the output wavelength is 3-10 mm. (Author).

8233 (KAERI/RR–1312/94) **Development of 200 W class Nd:YAG laser with unstable resonator.** Kim, Jeong Moog (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Kim, Cheol Jung; Cho, Jae Wan; Kim, Kwang Suk; Park, Seung Kyu; Lee, Soo Ho. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 58p. (In Korean). Order Number DE95612685. Source: OSTI; NTIS; INIS.

We developed a 200 W Class Nd:YAG laser with unstable resonator. We investigated the operational characteristics of laser with positive branch unstable resonator and analyzed the influence of laser parameters on the laser materials processing. Also, we designed and fabricated laser power supply for the modulated cw Nd:YAG laser and then measured the output parameters of this laser. To accelerate the commercialization by the joint company, the training and transfer of technology were pursued in the joint participation by company researchers from the early stage. (Author).

8234 (KAERI/RR–1337/93) **The development of optimal design technology in robotics -The development of advanced robotics for the nuclear industry-.** Kim, Tae Ryong (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Jung, Seung Ho; Park, Jin Ho; Park, Jin Seok. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 203p. (In Korean). Order Number DE95612686. Source: OSTI; NTIS; INIS.

A document for the nozzle dam design requirement (DR) was prepared, which can be applied to the domestic nuclear power plant. The general requirement and technical requirements for the loading conditions, material specification, radiation dose limit, etc. were clearly stated in the DR. KAERI designed nozzle dam mock-up (central section and two side section) was fabricated with the carbon fabric reinforced plastic (CFRP) which shows relatively high specific modulus and specific strength. The ratio of nozzle dam stiffness to weight was remarkably improved from 18.25×10^3 N m^2/kg (KORI nozzle dam) to 29.83×10^3 N m^2/kg (KAERI nozzle dam). And the structure integrity of KAERI nozzle dam was verified through the stress analysis using ANSYS program. Proper actuator and mechanism of the gripper to handle the nozzle dam were selected in order to obtain high gripping force by the optimal design of the link length to the gripping force ratio. The structural integrity of main link, sub-link, middle link, and main shaft of gripper were also verified. For the conceptual design of an electric robot manipulator to handle the nozzle dam, the driving torque required to move the payload (here nozzle dam: 20 kg) and the structural deadweight were computed at each joint of manipulator links. The preliminary structure integrity of manipulator under the loading conditions during the nozzle dam operation was also verified. For the development of a robot controller using personal computer, the computer operational system to be used was studied. (Author).

In this year (the second year of this project), researches and development have been carried out to establish the essential key technologies applied to robot system for nuclear industry. In the area of robot vision, in order to construct stereo vision system necessary to tele-operation, stereo image acquisition camera module and stereo image displayer have been developed. Stereo matching and storing programs have been developed to analyse stereo images. According to the result of tele-operation experiment, operation efficiency has been enhanced about 20% by using the stereo vision system. In a part of object recognition, a tele-operated robot system has been constructed to evaluate the performance of the stereo vision system and to develop the vision algorithm to automate nozzle dam operation. A nuclear fuel rod character recognition system has been developed by using neural network. As a result of perfomance evaluation of the recognition system, 99% recognition rate has been achieved. In the area of sensing and intelligent control, temperature distribution has been measured by using the analysis of thermal image histogram and the inspection algorithm has been developed to determine of the state be normal or abnormal, and the fuzzy controller has been developed to control the compact mobile robot designed for path moving on block-typed path. (Author).

The omni-directional planetary wheel type mobile robot (KAEROT/ml) has been developed on the concepts of the modularity, reliability, and stability. Manipulator system is designed in order to be able to install on mobile system and to upgrade operating capability. Control system consists of 68030 processor board, servo motor controller and I/O board. The 6 DOFs hydraulic manipulator is designed for nozzle dam installation and removal. The reachable length of manipulator is 1.7 m with the wrist configuration of pitch-yaw-roll. For the easy installation of manipulator from outside steam generator, specially designed guider is considered. Also master manipulator is designed for force feedback control. RCP (Remote Control Part) is constructed with Sparc processor boards and servo control boards. Graphic simulation has done for the evaluation of manipulator performance of nozzle dam works. (Author).

The objective of this study is to set the energy efficiency standards and to grade clothes washers and to plan the pomoting method for more spreading high efficiency electric motors. (author). refs., figs., tabs.

8238 (LA–12831-MS) **Calibration of neutron moisture gauges and their ability to spatially determine soil water content in environmental studies.** Nyhan, J.W.; Martinez, J.L.; Langhorst, G.J. Los Alamos National Lab., NM (United States). Oct 1994. 141p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006074. Source: OSTI; NTIS; INIS; GPO Dep.

Several neutron moisture gauges were calibrated, and their ability to spatially determine soil water content was evaluated. In 1982, the midpoint of sensitivity of each neutron probe to the detection of hydrogen was determined, as well as the radius of investigation of each probe in crushed Bandelier Tuff with varying water contents. After determining the response of one of the moisture gauges to changes in soil water at the soil-air interface, a neutron transport

model was successfully calibrated to predict spatial variations in soil water content. The model was then used to predict various shapes and volumes of crushed Bandelier Tuff interrogated by the neutron moisture gauge. From 1991 through 1994, six neutron moisture gauges were calibrated for soil water determinations in a local topsoil and crushed Bandelier Tuff, as well as for a sample of fine sand and soils from a field experiment at Hill Air Force Base. Statistical analysis of the calibration results is presented and summarized, and a final summary of practical implications for future neutron moisture gauge studies at Los Alamos is included.

8239 (NEI-DK–1795, pp. 101-107) **Experience gained in the lightning protection of aircraft and petrochemical installations applicable to wind turbine generators.** Baldwin, R.E. (AEA Lightning Centre, Culham, Abingdon, Oxfordshire (United Kingdom)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9403191–: 26. Meeting of experts on lightning protection of wind turbine generator systems and EMC problems in the associated control systems, Cologno Monzese (Italy), 8-9 Mar 1994). In *Lightning protection of wind turbine generator systems and EMC problems in the associated control systems.* 164p. Order Number DE95737572. Source: OSTI; NTIS.

The nature of lightning was discussed and the method used in the aircraft industry to gain adequate protection. Direct effects (damage) and some aircraft test specifications are presented in Appendix A. Indirect effects (electrical interference) and methods of avoiding problems of induced voltages are presented in Appendix B for aircraft, and Appendix C for ground installations. The main text deals with aspects of the protection of wind turbine generators using read across from aircraft and petro-chemical complex protection. (au)

8240 (NEI-DK–1795, pp. 139-148) **Lightning protection of the Fokker 100 CFRP rudder.** Ruiter, A.J.M. (Fokker Space and Systems V.V., Amsterdam (Netherlands)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. (CONF-9403191–: 26. Meeting of experts on lightning protection of wind turbine generator systems and EMC problems in the associated control systems, Cologno Monzese (Italy), 8-9 Mar 1994). In *Lightning protection of wind turbine generator systems and EMC problems in the associated control systems.* 164p. Order Number DE95737572. Source: OSTI; NTIS.

This paper describes the construction of the structural parts of the Fokker 100 CFRP rudder with respect to the requirements for electrical bonding and lightning protection. Furthermore the philosophy for the selection of a consumable trailing edge is given. A description of possible alternative designs for trailing edges and their advantages and disadvantages with respect to damage after lightning impact will also be reviewed. An overview of the tests performed on test samples and the rudder construction will be presented and discussed. The effectiveness of both the selected structural provisions and trailing edge will be described (and proven) by reporting the results of the simulated lightning tests performed at the High Voltage Laboratory of the N.V.KEMA, Arnhem, Holland. Proof will be presented that the trailing edge construction and its bonding through the structural parts of the rudder to the main aircraft structure is a solution which results in minor damage to the rudder after lightning impact. Furthermore it will be shown that the selected trailing edge construction is less favoured by the structural designers due to the weight penalty. (au)

8241 **Autonomous mobile robot for radiologic surveys.** Dudar, A.M.; Wagner, D.G.; Teese, G.D. 1992. Filed date 27 Oct 1992. U.S. Patent Application 7-966,925. 27p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95006139. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of an apparatus for conducting radiologic surveys. The apparatus comprises in the main a robot capable of following a preprogrammed path through an area, a radiation monitor adapted to receive input from a radiation detector assembly, ultrasonic transducers for navigation and collision avoidance, and an on-board computer system including an integrator for interfacing the radiation monitor and the robot. The robot may be equipped with memory for the collection and storage of radiation survey information. The on-board computer system is connected to a remote host computer via a UHF radio link. The apparatus is powered by a rechargeable 24-volt DC battery, and is stored at a docking station when not in use and/or for recharging. A remote host computer contains a stored database defining paths between points in the area where the robot is to operate, including but not limited to the locations of walls, doors, stationary furniture and equipment, and sonic markers if used. When a program consisting of a series of paths is downloaded to the on-board computer system, the robot conducts a floor survey autonomously at any preselected rate. When the radiation monitor detects contamination, the robot resurveys the area at reduced speed and resumes its preprogrammed path if the contamination is not confirmed. If the contamination is confirmed, the robot stops and sounds an alarm.

8242 **Apparatus for restraining and transporting dies.** Allison, J.W.; La Barre, T.L. To Dept. of Energy. 1992. Filed date 2 Sep 1992. U.S. Patent Application 7-970,882. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC11-76PN00014. Order Number DE95006111. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention relates to an apparatus for restraining and transporting dies in punch press operations, especially an apparatus including a hydraulic restraining fixture and a flotation platen which allows ease of release and movement of dies from one work station to another, with minimum work. The air flotation platen operates at 5-10 psi, and the hydraulically operated die restraining fixture holds the die and platen in place during the compacting in a punch press; the die and platen can be released easily after compacting.

8243 **Lightweight extendable and retractable pole.** Warren, J.L.; Brandt, J.E. 1992. Filed date 2 Dec 1992. U.S. Patent Application 7-984,598. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-88NV10617. Order Number DE95006119. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A lightweight extendable and retractable telescopic pole is disclosed comprising a plurality of non-metallic telescoping cylinders with sliding and sealing surfaces between the cylinders, a first plug member on the upper end of the smallest cylinder, and a second plug member on the lower end of the largest cylinder, whereby fluid pressure admitted to the largest cylinder will cause the telescoping cylinders to slide relative to one another causing the pole to extend. An elastomeric member connects the first plug member with one of the intermediate cylinders to urge the cylinders back into a collapsed position when the fluid pressure in the cylinders is vented. Annular elastomer means are provided which seal one cylinder to another when the pole is fully extended and further serve to provide a cushion to prevent damage to the cylinders when the pole is urged back into its retractable position by the elastomeric means and the venting of the pressure. Valve means associated with the pole are provided to admit a fluid under pressure to the interior of the telescoping cylinders the pole while pressurizing a pressure relief port having an opening larger than the inlet port in a closed position whereby removal of the pressure on the relief port will cause the relief port to open to quickly lower the pressure in the interior of the telescoping cylinders to thereby assist in the rapid retraction of the extended pole.

8244 (PNL-SA–24072) **A redundant, 6-DOF parallel manipulator structure with improved workspace and dexterity.** Stoughton, R.S. (Pacific Northwest Lab., Richland, WA (United States)); Salerno, R.; Canfield, S.; Reinholtz, C. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940859–29: 5. international symposium on robotics and manufacturing, Maui, HI (United States), 14-18 Aug 1994). Order Number DE95004898. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a novel manipulator structure which combines two known parallel manipulator structures–a Stewart Platform (SP), and a double octahedral Variable Geometry Truss (VGT). The combined VGT + SP structure is redundant, using nine actuators to realize six-DOF motion. Combining the two structures allows the translational and orientational workspaces of the two individual structures to sum together to a much larger workspace than is generally achievable with parallel manipulator structures. In addition, the VGT portion of the structure allows the configuration of the Stewart Platform to be changed "on the fly" from one with a

large workspace to one with high dexterity. A useful application of this structure is at the distal end of a truss-based manipulator, where it can serve as a dexterous wrist while preserving an internal passageway for cabling and/or conveyance systems.

8245 (WHC-SD-SQA-CSA–20381) **CSER 94-014: Storage of metal-fuel loaded EBR-II casks in concrete vault on PFP grounds.** Hess, A.L. Westinghouse Hanford Co., Richland, WA (United States). 5 Dec 1994. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004750. Source: OSTI; NTIS; INIS; GPO Dep.

A criticality safety evaluation is presented to permit EBR-2 spent fuel casks loaded with metallic fuel rods to be stored in an 8-ft diameter, cylindrical concrete vault inside the PFP security perimeter. The specific transfer of three casks with Pu alloy fuel from the Los Alamos Molten Plutonium Reactor Experiment from the burial grounds to the vault is thus covered. Up to seven casks may be emplaced in the casing with 30 inches center to center spacing. Criticality safety is assured by definitive packaging rules which keep the fissile medium dry and at a low effective volumetric density.

8246 (WHC-SD-SQA-CSA–20384) **Addendum 3 to CSAR 80-027, Use of calorimeter 109B for fissile material measurement.** Chiao, T. Westinghouse Hanford Co., Richland, WA (United States). 5 Dec 1994. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004491. Source: OSTI; NTIS; INIS; GPO Dep.

This modification to the Plutonium Finishing Plant (PFP) calorimeter system involves removing current calorimeter No. 3 from the water bath and replacing it with a calorimeter that can accommodate larger diameter items (an oversize can). The inside diameters of both the sample and the reference cells will be increased to 5.835 inches at the top opening and to 5.22 inches at the bottom, the 8 inch high measurement zone. This Addendum 3 to Criticality Safety Analysis Report 80-027 examines criticality safety during the use of the modified calorimeter (Calorimeter 109B) with enlarged cell tube diameters to assure that an adequate margin of subcriticality is maintained for all normal and contingency conditions.

8247 (WHC-SD-WM-OTP–170) **Test plan for a U.S. Department of Transportation Specification 7A Type A radioactive material packaging, WHC Liquid Sample Package (unshielded) (3M SafeSend® Reusable Super Pack Shipping System [SP-R1L Kit]).** Kelly, D.L. Westinghouse Hanford Co., Richland, WA (United States). 13 Jan 1995. 144p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005980. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this Test Plan is to describe the testing for certification of the 3M SafeSend container (SP-R1L, unshielded) as a US Department of Transportation Specification 7A Type A (DOT-7A) liquid package. The SafeSend SP-R1L is manufactured by the 3M Company and designed to be reusable up to eight times. The contents of the test units will be a polyethylene-coated glass bottle filled with carbon steel shot and water to simulate a liquid with a specific gravity of 2. The SafeSend SP-R1L, unshielded container, will consist of the "as-manufacture" package with a payload being a 1-liter (32-oz), polycoated, wide-mouth glass bottle with a Teflon-lined phenolic lid, and filled with the simulated contents as stated above. The packaging also includes six foam spacers and a cardboard shipper. Testing was conducted in September 1994. The packagings being tested are also intended for use in air transportation.

8248 (WHC-SD-WM-OTR–170) **Test and evaluation report, U.S. Department of Transportation Specification 7A Type A radioactive material packaging, WHC Solid Sample Package (unshielded) (3M SafeSend® Reusable Super Pack Shipping System [SP-R1L Kit]).** Kelly, D.L. Westinghouse Hanford Co., Richland, WA (United States). 18 Jan 1995. 92p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005986. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the US Department of Transportation Specification 7A Type A (DOT-7A) compliance test results of the Westinghouse Hanford Company Solid Sample Package, unshielded version. Testing was conducted on two packaging configurations in September 1994. The packagings tested were originally intended to be qualified for transporting liquids having a specific gravity of 2. However, during the 9-m (30-ft) drop tests, the internal polycoated glass bottle either broke or cracked when the packaging impacted the test pad. Therefore, the packaging configurations, as described herein, may be used in transporting solids but not liquids. The packaging configurations described may be transported by air, and meet the applicable International Air Transport Association/International Divil Aviation Organization (IATA/ICAO), Dangerous Goods Regulations, in addition to the DOT-7A requirements.

4204 Heat Transfer and Fluid Flow

8249 (DOE/CE/26592–2) **Development of advanced low-temperature heat transfer fluids for district heating and cooling, final report.** Cho, Y.I.; Lorsch, H.G. Drexel Univ., Philadelphia, PA (United States). 31 Mar 1991. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-89CE26592. Order Number DE95004709. Source: OSTI; NTIS; GPO Dep.

The feasibility of adding phase change materials (PCMS) and surfactants to the heat transfer fluids in district cooling systems was investigated. It increases the thermal capacity of the heat transfer fluid and therefore decreases the volume that needs to be pumped. It also increases the heat transfer rate, resulting in smaller heat exchangers. The thermal behavior of two potential PCMS, hexadecane and tetradecane paraffin wax, was experimentally evaluated. The heat of fusion of these materials is approximately 60% of that of ice. They exhibit no supercooling and are stable under repeated thermal cycling. While test results for laboratory grade materials showed good agreement with data in the literature, both melting point and heat of fusion for commercial grade hexadecane were found to be considerably lower than literature values. PCM/water mixtures were tested in a laboratory-scale test loop to determine heat transfer and flow resistance properties. For 10% and 25% PCM/water slurries, the heat transfer enhancement was found to be approximately 18 and 30 percent above the value for water, respectively. Within the turbulent region, there is only a minor pumping penalty from the addition of up to 25% PCM to the water. Research is continuing on these fluids in order to determine their behavior in large-size loops and to arrive at optimum formulations.

8250 (DOE/ER/40878–T1) **Cryogenic helium gas convection research.** Donnelly, R.J. (ed.). Oregon Univ., Eugene, OR (United States). Dept. of Physics. Oct 1994. 202p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-94ER40878. Order Number DE95004372. Source: OSTI; NTIS; INIS; GPO Dep.

This is a report prepared by a group interested in doing research in thermal convection using the large scale refrigeration facilities available at the SSC Laboratories (SSCL). The group preparing this report consists of Michael McAshan at SSCL, Robert Behringer at Duke University, Katepalli Sreenivasan at Yale University, Xiao-Zhong Wu at Northern Illinois University and Russell Donnelly at the University of Oregon, who served as Editor for this report. This study reports the research and development opportunities in such a project, the technical requirements and feasibility of its construction and operation, and the costs associated with the needed facilities and support activities. The facility will be a unique national resource for studies of high-Reynolds-number and high-Rayleigh-number and high Rayleigh number turbulence phenomena, and is one of the six items determined as suitable for potential funding through a screening of Expressions of Interest. The proposed facility is possible only because of the advanced cryogenic technology available at the SSCL. Typical scientific issues to be addressed in the facility will be discussed. It devolved during our study, that while the main experiment is still considered to be the thermal convection experiment discussed in our original Expression of Interest, there are now a very substantial set of other, important and fundamental experiments which can be done with the large cryostat proposed for the convection experiment. We believe the facility

could provide several decades of front-line research in turbulence, and shall describe why this is so.

8251 (FRCEA-TH–411) **Finite elements volumes methods: applications to the Navier-Stokes equations and convergence results.** Emonot, P. CEA Centre d'Etudes de Grenoble, 38 (France). Dept. de Thermohydraulique et de Physique; Lyon-1 Univ., 69 - Villeurbanne (France). 3 Dec 1992. 110p. (In French). Order Number DE95612667. Source: OSTI; NTIS (US Sales Only); INIS.

In the first chapter are described the equations modeling incompressible fluid flow and a quick presentation of finite volumes method. The second chapter is an introduction to the finite elements volumes method. The box model is described and a method adapted to Navier-Stokes problems is proposed. The third chapter shows a fault analysis of the finite elements volumes method for the Laplacian problem and some examples in one, two, three dimensional calculations. The fourth chapter is an extension of the error analysis of the method for the Navier-Stokes problem.

8252 (KAERI/RR–1206/92) **Development of high pressure two-phase choked flow analysis methodology in complex piping system.** Yoo, Geun Jong (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Sim, Yoon Sub; Chung, Chang Kyu; Lee, Jun. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1992. 97p. (In Korean). Order Number DE95612668. Source: OSTI; NTIS; INIS.

Choked flow mechanism, characteristics of two-phase flow sound velocity and compressibility effects on flow through various piping system components are studied to develop analysis methodology for high pressure two-phase choked flow in complex piping system which allows choking flow rate evaluation and piping system design related analysis. Piping flow can be said choked if Mach number is equal to 1 and compressibility effects can be accounted through modified incompressible formula in momentum equation. Based on these findings, overall analysis system is developed to study thermal-hydraulic effects on steady-state piping system flow and future research items are presented. (Author).

8253 (NEI-NO–468) **Experimental investigation of an equilibrium boundary layer in strong adverse pressure gradient.** Skaare, P.E. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. 1994. 189p. Order Number DE95737635. Source: OSTI; NTIS.

The experimental results for an equilibrium type boundary layer in a strong adverse pressure gradient flow are reported. The measurements show that similarity in the mean flow and the turbulent stresses has been achieved over a substantial streamwise distance where the skin friction coefficient is kept at a low, constant level. Although the Reynolds stress distribution across the layer is entirely different from the flow at zero pressure gradient, the ratios between the different turbulent stress components were found to be similar, showing that the mechanism for distributing the turbulent energy between the different components remains unaffected by the mean flow pressure gradient. Close to the surface the gradient of the mixing length was found to increase from 0.41 to 0.78. This is almost twice as high as for the zero pressure gradient case. The multi-point measurements indicated strong effects of the pressure gradient on the turbulent structure of the boundary layer. The average inclination from the wall in the (x, y) plane was found to be much more constant (about 20 degrees) through the layer than in the zero pressure gradient case. The length scales associated with the two-point correlations of the velocity fluctuations increased much faster with respect to the distance from the wall. In the bulk part of the layer the length scales were comparable to the length scales found in the zero pressure gradient layer, except for the streamwise length scale of the two-point correlation which was approximately half the length. Similarity in the triple correlation was also found to be good. The correlations show that there is a considerable diffusion of turbulent energy from the central part of the boundary layer towards the wall. The diffusion mechanism is caused by a second peak in the turbulence production, located at y/δ to be about 0.45. This production was for the present case almost as strong as the production found near the wall.

8254 (NEI-NO–473) **Dynamic simulation of the liquefaction section in baseload LNG plants.** Melaaen, E. Trondheim Univ. (Norway). Norges Tekniske Hoegskole. Oct 1994. 163p. Order Number DE95744875. Source: OSTI; NTIS.

The thesis demonstrates modelling and simulation of a cryogenic heat exchanger in a baseload LNG plant within two main areas. The first one concerns the development and description of the transient liquefaction models. The second one looks at the verification and studies the process dynamics. Three transient models, model A, B and C, were developed. Models A and B were simplified models based on the energy balance, with model B additionally considering an accumulation of liquid in separator drums. Model C was a complete model which also handled accumulation of mass and momentum in heat exchangers and drums. Each unit in the plant was modeled separately and linked in a process flow sheet. The greatest challenge during design of the simulation system was to model the coil-wound heat exchanger. A strong coupling between the variables and the nonlinear equations led to converge problems in certain cases. The equation system was particularly sensitive in the region where the fluid was on the border of single and two-phase flow. A model of the digital control system was implemented, and start-up, shutdown, steady-state operation and change over in the production capacity were described. Simulation of these different operation models were performed, and particular effects due to changes in control parameters or input variables such as pressure, temperature, flow rate and compositions, were discussed. Small alteration of these parameters caused displacement in the heat-exchanger load, and prevented the process from running optimal. As a result, the process could not manage to produce the specified LNG-quantity. Consequences could also be fluctuation in the tube-wall temperature, which might eventually destroy the equipment through material stress. 72 refs., 48 figs., 30 tabs.

8255 (SAND–94-1402C) **A domain decomposition study of massively parallel computing in compressible gas dynamics.** Wong, C.C. (Sandia National Labs., Albuquerque, NM (United States)); Blottner, F.G.; Payne, J.L.; Soetrisno, M. Sandia National Labs., Albuquerque, NM (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950130–4: 33. American Institute of Aeronautics and Astronautics (AIAA) aerospace sciences meeting, Reno, NV (United States), 9-12 Jan 1995). Order Number DE95004759. Source: OSTI; NTIS; GPO Dep.

The appropriate utilization of massively parallel computers for solving the Navier-Stokes equations is investigated and determined from an engineering perspective. The issues investigated are: (1) Should strip or patch domain decomposition of the spatial mesh be used to reduce computer time? (2) How many computer nodes should be used for a problem with a given sized mesh to reduce computer time? (3) Is the convergence of the Navier-Stokes solution procedure (LU-SGS) adversely influenced by the domain decomposition approach? The results of the paper show that the present Navier-Stokes solution technique has good performance on a massively parallel computer for transient flow problems. For steady-state problems with a large number of mesh cells, the solution procedure will require significant computer time due to an increased number of iterations to achieve a converged solution. There is an optimum number of computer nodes to use for a problem with a given global mesh size.

Massively parallel (MP) computing is considered to be the future direction of high performance computing. When engineers apply this new MP computing technology to solve large-scale problems, one major interest is what is the maximum problem size that a MP

computer can handle. To determine the maximum size, it is important to address the code scalability issue. Scalability implies whether the code can provide an increase in performance proportional to an increase in problem size. If the size of the problem increases, by utilizing more computer nodes, the ideal elapsed time to simulate a problem should not increase much. Hence one important task in the development of the MP computing technology is to ensure scalability. A scalable code is an efficient code. In order to obtain good scaled performance, it is necessary to first have the code optimized for a single node performance before proceeding to a large-scale simulation with a large number of computer nodes. This paper will discuss the implementation of a massively parallel computing strategy and the process of optimization to improve the scaled performance. Specifically, we will look at domain decomposition, resource management in the code, communication overhead, and problem mapping. By incorporating these improvements and adopting an efficient MP computing strategy, an efficiency of about 85% and 96%, respectively, has been achieved using 64 nodes on MP computers for both perfect gas and chemically reactive gas problems. A comparison of the performance between MP computers and a vectorized computer, such as Cray-YMP, will also be presented.

8257 (SAND–94-2064C) **Silicon heat pipes for cooling electronics.** Adkins, D.R.; Shen, D.S.; Palmer, D.W.; Tuck, M.R. Sandia National Labs., Albuquerque, NM (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9411166–1: 1. annual spacecraft thermal control symposium, Albuquerque, NM (United States), 16-18 Nov 1994). Order Number DE95004553. Source: OSTI; NTIS; GPO Dep.

The increasing power density of integrated circuits (ICs) is creating the need for improvements in systems for transferring heat away from the chip. In earlier investigations, diamond films were used to conduct heat from ICs and spread the energy across a heat sink. The authors' investigation has indicated that a 635 μm (25 mil) thick silicon substrate with embedded heat pipes could perform this task better than a diamond film. From their study, it appears that the development of a heat-pipe heat-spreading system is both technically and commercially feasible. The major challenge for this heat-spreading system is to develop an effective wick structure to transport liquid to the heated area beneath the chip. This paper discusses the crucial design parameters for this heat-pipe system, such as the required wick properties, the material compatibility issues, and the thermal characteristics of the system. The paper also provides results from some recent experimental activities at Sandia to develop these heat-pipe heat spreader systems.

8258 (SAND–94-3190C) **Verification of computational aerodynamic predictions for complex hypersonic vehicles using the INCA™ code.** Payne, J.L.; Walker, M.A. Sandia National Labs., Albuquerque, NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950130–3: 33. American Institute of Aeronautics and Astronautics (AIAA) aerospace sciences meeting, Reno, NV (United States), 9-12 Jan 1995). Order Number DE95004757. Source: OSTI; NTIS; GPO Dep.

This paper describes a process of combining two state-of-the-art CFD tools, SPRINT and INCA, in a manner which extends the utility of both codes beyond what is possible from either code alone. The speed and efficiency of the PNS code, SPRING, has been combined with the capability of a Navier-Stokes code to model fully elliptic, viscous separated regions on high performance, high speed flight systems. The coupled SPRINT/INCA capability is applicable for design and evaluation of high speed flight vehicles in the supersonic to hypersonic speed regimes. This paper describes the codes involved, the interface process and a few selected test cases which illustrate the SPRINT/INCA coupling process. Results have shown that the combination of SPRINT and INCA produces correct results and can lead to improved computational analyses for complex, three-dimensional problems.

8259 (TTKK-LT–92) **Particle-turbulence interaction in dilute suspensions.** Karema, H. Tampere Univ. of Technology (Finland). Thermal Engineering. 1993. 79p. Order Number DE95737624. Source: OSTI; NTIS.

The interaction between particles and fluid turbulence in dilute suspensions is studied in this work. It is done by dividing the problem into two separate issues where the first one treats the response of a particle to fluid turbulence and the second one the modification of fluid turbulence caused by the particles. The ideas developed on the basis of these two issues are then used to analyse the transversal mixing rate of a passive scalar in an upward fully developed flow of a gas-particle suspension. Special interest in this case is in the capability of the gradient-diffusion model to predict the experimentally obtained changes in the mixing rate. The intention of this work is to indicate the most important parameters of the particle-turbulence interaction with their individual effects. It is done on the base of currently available and verified results intentionally avoiding advanced speculations. Because of the long term interest in a common frame-work of dilute and dense suspension the emphasis is on an Eulerian approach. The governing phenomenon in the turbulent dispersion of particles is the effect of crossing trajectories caused by the drift velocity. The resulting particle diffusion coefficient is considerably lower than the corresponding fluid point diffusion coefficient. Particle inertia has minor importance in producing a slight increase in diffusion coefficient. The importance of the two parameters of interaction, the ratio of the particle diameter to the integral length scale of the fluid and the particle Reynolds number, are strongly supported by experimental observations and theoretical hypothesis. According to these guide lines small particles tend to attenuate turbulence and large particles tend to augment it.

8260 (TTKK-LT–93) **Heat transfer and hydrodynamics of falling liquid films.** Haerkoenen, M.; Aula, A.; Aittomaeki, A. Tampere Univ. of Technology (Finland). Thermal Engineering. 1993. 72p. Order Number DE95737625. Source: OSTI; NTIS.

A series of heat transfer experiments is performed with saturated pure water and sugar/water solution films flowing down on outside surface of a smooth or fluted vertical stainless steel tube near atmospheric pressure. Experimental apparatus is designed and built. Data on length-averaged heat transfer coefficient are presented in a range of Prandtl numbers $2 < Pr < 20$ with wall heat fluxes up to 30 kW/m_2. Results show that the measured heat transfer coefficient does not agree very well with the well-known correlation of Chun and Seban. A new corrected heat transfer correlation is presented. Results with fluted tube are presented and a comparison with smooth tube shows, that the heat transfer is increased slightly more than the increased heat transfer area presumes. Film thickness measurements are carried out by a specially designed probe assembly. Wave frequencies and wave lengths are also determined. According to the measurements the typical wave frequency is about 10-15 Hz near the film distribution device and is rapidly decreasing to the value of about 5 Hz. Measured film thickness and wave velocity show a trend according to some literature correlations.

8261 (ANL/ASD/CP–84555) **A new target concept for production of slow positrons.** Qian, Y.L; White, M. Argonne National Lab., IL (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941129–11: 13. international conference on the application of accelerators in research and industry, Denton, TX (United States), 7-10 Nov 1994). Order Number DE95004596. Source: OSTI; NTIS; INIS; GPO Dep.

Slow positrons in the energy range up to a few keV are useful for material sciences and surface studies. The Advanced Photon Source (APS) linear accelerator (linac) was designed to produce 8-mA of 450-MeV positrons. A 200-MeV, 1.7-Ampere electron beam impinges on a 7-mm-thick (2 radiation lengths) tungsten target, resulting in bremsstrahlung pair production of electrons and positrons. The existing target was optimized for high energy positron production, and most slow positrons produced by the electron-gamma shower remain trapped inside. The linac could also be used to produce slow positrons, and a modified target could increase the low energy positron yield. Use of a multilayer or

segmented target reduces self-absorption by the target, and thus more fully utilizes the incident beam power for slow positron production. A slow positron yield of 10^9/sec is expected from the existing incident electron beam. Multilayer targets could probably be used by other accelerator-based slow positron sources to improve slow positron yield without increasing the incident beam power. Two variations of a multilayer target concept are presented and discussed in this paper.

8262 (KAERI/RR–1255/93) **Development of nondestructive testing technology for the crack-like defects of steam generator tubes (II).** Cheong, Yong Moo (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Park, Jong Hyun; Huh, Hyung; Kang, Ki Won. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 68p. (In Korean). Order Number DE95612782. Source: OSTI; NTIS; INIS.

In order to develop the nondestructive testing technology for the cracks at the tube expansion region in steam generator ultrasonic technique using leaky surface wave was applied for the detection of simulated crack-like defects of the 304 stainless steel plate. The ultrasonic technique shows higher detectability for the simulated cracks than conventional eddy current technique (MRPC, Motorized Rotating Pancake Coil). The ultrasonic technique could reduce some error encountered in the measurement of crack length. However, since the ultrasonic technique is not a well-established method for the crack in steam generator tubings at present, it could be used as a supplementary method for improving reliability on the detection of crack-like defects and accurate measurement of the crack length, in addition to the basic eddy current technique (MRPC). (Author).

8263 (KAERI/RR–1272/93) **A study on the irradiation effect on reactor materials using a cyclotron.** Hong, Jun Hwa (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Chi, Se Hwan; Lee, Bong Sang; Park, Duck Gun; Park, Jong Man; Oh, Jong Myung. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jan 1994. 106p. (In Korean). Order Number DE95612783. Source: OSTI; NTIS; INIS.

Effects of proton or neutron irradiation on domestic 12Cr-1MoV and SA 508 C1.3 steels were evaluated by small-scale specimen test techniques, i.e, small punch (SP) and miniaturized tensile specimen (MTS) test. Two critical irradiation conditions, i.e, fluence and irradiation temperature, were determined to describe and compare each test result together by E-DEP-1.ext code (TRIM code) and low melting point eutectic alloys. Test results showed that these techniques can be used for evaluating irradiation effects in terms of standard specimen fracture parameters, provided a sufficient data base is prepared for size effects and ϵ_{qf} - J_{IC} relation. (Author).

8264 (KAERI/RR–1336/93) **Material performance evaluation -Development of the advanced nuclear materials-.** Kim, Uh Chul (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Yang, Kyung Rin; Nho, Kye Ho; Chung, Han Sub; Kim, Hong Pyo; Hwang, Sung Sik; Han, Jeong Ho; Lee, Eun Hee; Lee, Deok Hyun; Hur, Do Haeng. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 213p. (In Korean). Order Number DE95612784. Source: OSTI; NTIS; INIS.

A multifrequency ACPD system was assembled. A SSRT equipment for stress corrosion cracking test was installed. A 25-ton capacity fatigue test machine was purchased as a first step to assemble a corrosion fatigue test facility. A test loop was designed to simulate the primary water chemistry condition. An Ag/AgCl external reference electrode which can be used at a temperature as high as 280 deg C was fabricated. A high temperature pH electrode was designed for fabrication. A creep test machine was designed conceptually for testing creep behaviors of Zr alloys. Preliminary design requirements were made for the instrumented capsule and a plan was made for using the uninstrumented capsule, as parts of activities to complete an integrated plan of in-reactor materials irradiation test. CHEC computer code which helped improving maintenance program against erosion/corrosion of secondary pipings of nuclear power plants was purchased. Erosion/corrosion of feedwater heater drain line of Kori Unit One was analyzed using the CHEC code as a sample calculation. (Author).

8265 (STUDSVIK-M–94-131) **Relining of pipelines for natural gas distribution (Swage-lining).** Leijstroem, H. Studsvik Material AB, Nykoeping (Sweden). Oct 1994. 52p. (In Swedish). Order Number DE95737678. Source: OSTI; NTIS.

Pressure testing during almost two years have shown that Swage-lined test pipes have good long-life properties. There are, however, certain indications that Swage-lined pipes have a somewhat shorter long-time strength. The reason may be scratches that arises during the lining process. The scratches are not judged as life-time limiting as long as they are not deeper than 1 mm. Inner stress measurements shows large differences between Swage-lined and not Swage-lined pipes. For Swage-lined pipes the maximum tangential inner stress in the pipe wall have completely disappeared, at the same time as high axial inner stresses are measured (large relative decrease in length). 12 refs

4210 Combustion Systems

8266 (DOE/METC–94/1009) **Aerovalve pulse combustion: Technical note.** Richards, G.A.; Gemmen, R.S.; Narayanaswami, L. USDOE Morgantown Energy Technology Center, WV (United States). Jul 1994. 33p. Sponsored by USDOE, Washington, DC (United States). Order Number DE94012262. Source: OSTI; NTIS; GPO Dep.

The authors present a mathematical model and an experimental investigation of aerodynamically valved pulse combustion. The model uses a control-volume approach to solve conservation laws in several regions of a pulse combustor. Mixing between the fresh charge and combustion products is modeled as a two-step process, with the mixing occurring slowly for a specified eddy time during each cycle, and then changing to a higher rate. Results of model simulations demonstrate that eddy time plays a significant role in determining the frequency and amplitude of combustion oscillation. The authors show that short eddy times produce steady, rather than pulsating, combustion. And they show that changes to the mixing process alter the temperature-species history of combustion gases in a manner that could prevent or promote the formation of nitrogen oxides, depending on specific mixing rates. The relatively simple control-volume approach used in this model allows rapid investigation of a wide range of geometric and operating parameters, and also defines characteristic length and time scales relevant to aerovalve pulse combustion. Experimental measurements compare favorably to model predictions. The authors place particular emphasis on time-averaged pressure differences through the combustor, which act as an indicator of pressure gain performance. They investigate both operating conditions and combustor geometry, and they show that a complex interaction between the inlet and exit flows of a combustor makes it difficult to produce general correlations among the various parameters. They use a scaling rule to produce a combustor geometry capable of producing pressure gain.

8267 (KE–93002B) **A study on the multi-stage combustion in incinerator with low pollution.** Park, S.I. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Dong, S.K.; Park, Y.J.; Choi, K.B. No corporate text available. Dec 1993. 162p. (In Korean). Order Number DE95744282. Source: OSTI; NTIS (US Sales Only).

The pollutant emission of incinerator depends largely on the design of afterburner. As large amount of particulates are included in the flue gas from incinerator, the longer residence time is established by forming swirl flow in the afterburner. In this study, two afterburner configurations were selected. The 3-dimensional flow and combustion in the model are analyzed and emission characteristics were evaluated. Also, the flow in the model was visualized using water model. And the 3-dimensional flow was measured using the 5-hole pitot tube. The mixing characteristics of flow was investigated by measuring CO concentration distribution at the model exit. As a result, the effect of swirl flow on the mixing was relatively small and the effect of high velocity flow from nozzles was significant. (author). refs., figs., tabs.

8268 (ANL–94/39) **Practical superconductor development for electrical power applications, annual report for FY 1994.** Balachandran, U. Argonne National Lab., IL (United States). Oct 1994. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95006075. Source: OSTI; NTIS; GPO Dep.

Development of useful high-critical-temperature superconductors requires synthesis of superconducting compounds; fabrication of wires, tapes, and films from these compounds; production of composite structures that incorporate stabilizers or insulators; and design and testing of efficient components. This report describes technical progress of research and development efforts aimed at producing superconducting components in the Y-Ba-Cu, (Bi,Pb)-Sr-Ca-Cu, (Tl,Pb,Bt)-(Ba,Sr)-Ca-Cu. and Hg-Ba-Ca-Cu-0 oxide systems. Topics discussed are synthesis and heat treatment of high-Tc superconductors, formation of monolithic and composite conductors. characterization of structures and superconducting and mechanical properties, and fabrication and testing of prototype components. Collaborations with industry and academia are documented.

8269 (ANL/ASD/CP–83682) **Ultrafast, high precision gated integrator.** Wang, X. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9410219–23: Beam instrumentation workshop, Vancouver (Canada), 2-6 Oct 1994). Order Number DE95004616. Source: OSTI; NTIS; GPO Dep.

An ultrafast, high precision gated integrator has been developed by introducing new design approaches that overcome the problems associated with earlier gated integrator circuits. The very high speed is evidenced by the output settling time of less than 50 ns and 20 MHz input pulse rate. The very high precision is demonstrated by the total output offset error of less than 0.2mV and the output droop rate of less than $10\mu V/\mu s$. This paper describes the theory of this new gated integrator circuit operation. The completed circuit test results are presented.

8270 (LBL–36055) **Undulators for short wavelength FEL amplifiers.** Schlueter, R. (Lawrence Berkeley Lab., CA (United States). Accelerator and Fusion Research Div.). Lawrence Berkeley Lab., CA (United States). Aug 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9408146–14: 16. international free electron laser conference, Stanford, CA (United States), 21-26 Aug 1994). Order Number DE95004690. Source: OSTI; NTIS; INIS; GPO Dep.

Issues critical to the design of undulators for use in short wavelength FEL amplifiers, such as attainable on-axis field strength, device compactness, field quality, required magnetic gap, and strong focusing schemes, are discussed. The relative strength of various undulator technologies, including pure permanent magnet, hybrid, warm electromagnetic, pulsed, and superconducting electromagnetic devices in both helical and planar configurations are reviewed. Favored design options for proposed short wavelength FELs, such as the Linac Coherent Light Source at SLAC and the DUV Free-Electron Laser at BNL, are presented.

8271 Method and apparatus for measuring the intensity and phase of an ultrashort light pulse. Kane, D.J.; Trebino, R.P. 1992. Filed date 26 Oct 1992. U.S. Patent Application 7-966,644. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006140. Source: OSTI; NTIS (US Sales Only); GPO Dep.

The pulse shape I(t) and phase evolution $_x$(t) of ultrashort light pulses are obtained using an instantaneously responding nonlinear optical medium to form a signal pulse. A light pulse, such a laser pulse, is split into a gate pulse and a probe pulse, where the gate pulse is delayed relative to the probe pulse. The gate pulse and the probe pulse are combined within an instantaneously responding optical medium to form a signal pulse functionally related to a temporal slice of the gate pulse corresponding to the time delay of the probe pulse. The signal pulse is then input to a wavelength-selective device to output pulse field information comprising intensity vs. frequency for a first value of the time delay. The time delay is varied over a range of values effective to yield an intensity plot of signal intensity vs. wavelength and delay. In one embodiment, the beams are overlapped at an angle so that a selected range of delay times is within the intersection to produce a simultaneous output over the time delays of interest.

8272 Visible light emitting vertical cavity surface emitting lasers. Bryan, R.P.; Lott, J.A.; Olbright, G.R.; Schneider, R.P. To Dept. of Energy. 1992. Filed date 5 Nov 1992. U.S. Patent Application 7-972,820. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00789. Order Number DE95006108. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A vertical cavity surface emitting laser that emits visible radiation is built upon a substrate, then having mirrors, the first mirror on top of the substrate; both sets of mirrors being a distributed Bragg reflector of either dielectrics or other materials which affect the resistivity or of semiconductors, such that the structure within the mirror comprises a plurality of sets, each having a thickness of λ/2n where n is the index of refraction of each of the sets; each of the mirrors adjacent to spacers which are on either side of an optically active bulk or quantum well layer; and the spacers and the optically active layer are from one of the following material systems: $In_2(Al_yGa_{1-y})_{1-z}P$, InAlGaAs, AlGaAs, InGaAs, or AlGaP/GaP, wherein the optically active region having a length equal to m $\lambda/2n_{eff}$ where m is an integer and n_{eff} is the effective index of refraction of the laser cavity, and the spacer layer and one of the mirrors being transmissive to radiation having a wavelength of λ/n, typically within the green to red portion of the visible spectrum.

8273 Temperature-insensitive phase-matched optical harmonic conversion crystal. Barker, C.E.; Eimerl, D.; Velsko, S.P.; Roberts, D. 1992. Filed date 25 Nov 1992. U.S. Patent Application 7-981,636. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006122. Source: OSTI; NTIS (US Sales Only); GPO Dep.

Temperature-insensitive, phase-matched harmonic frequency conversion of laser light at a preferred wavelength of 1.064 microns can be achieved by use of a crystal of deuterated 1-arginine phosphate. The crystal is cut and oriented so that the laser light propagates inside the crystal along one of several required directions, which correspond to a temperature-insensitive, phase-matching locus. The method of measuring and calculating the temperature-insensitive, phase-matching angles can be extended to other fundamental wavelengths and other crystal compositions.

8274 Linear optocoupler. Kronberg, J.W. To Dept. of Energy. 1992. Filed date 21 Dec 1992. U.S. Patent Application 7-993,553. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006114. Source: OSTI; NTIS (US Sales Only); GPO Dep.

An optocoupler for isolating electrical signals is disclosed that translates an electrical input signal linearly to an electrical output signal. The optocoupler comprises a light emitter, a light receiver, and a light transmitting medium. The light emitter, preferably a blue, silicon carbide LED, is of the type that provides linear, electro-optical conversion of electrical signals within a narrow wavelength range. Correspondingly, the light receiver, which-converts light signals to electrical signals and is preferably a cadmium sulfide photoconductor, is linearly responsive to light signals within substantially the same wavelength range as the blue LED. The device can be used to isolate two parts of an electrical circuit.

8275 (PPPL–3031) **Progress in compact soft x-ray lasers and their applications.** Suckewer, S.; Skinner, C.H. Princeton Univ., NJ (United States). Plasma Physics Lab. Jan 1995. 17p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC02-76CH03073. Order Number DE95006232. Source: OSTI; NTIS; INIS; GPO Dep.

The ultra-high brightness and short pulse duration of soft x-ray lasers provide unique advantages for novel applications. A crucial factor in the availability of these devices is their scale and cost. Recent breakthroughs in this field has brought closer the advent of table-top devices, suitable for applications to fields such as x-ray microscopy, chemistry, material science, plasma diagnostics, and

lithography. In this article we review recent progress in the development of compact (table-top) soft x-ray lasers.

8276 (SAND–94-2206C) **Laser beam characterization results for a high power CW Nd:YAG laser.** Keicher, D.M. Sandia National Labs., Albuquerque, NM (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950226–1: SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine, San Jose, CA (United States), 5-10 Feb 1995). Order Number DE95006319. Source: OSTI; NTIS; GPO Dep.

In an effort to understand multimode laser beam propagation characteristics for better development of laser material processing applications, beam diagnostic experiments were performed on a 1800 watt CW Nd:YAG laser. Beam diameter data were acquired at approximately 12 positions along the beam optical axis about the minimum waist created by a long focal length single element lens at several power levels. These data were then used to evaluate the laser output beam characteristics using two differing techniques. For the ISO technique, two data points from the beam diameter data were used in determining the output laser beam characteristics. These points were the beam minimum waist diameter and the diameter at a point along the beam optical axis where the beam diameter had increased to approximately 0.7 times that of the beam minimum waist diameter. The second analysis technique involved fitting the entire data set to theoretical equations used to describe the multimode laser beam propagation and points from the fitted curve fit were then used to determine the output beam characteristics from the laser. For all power levels evaluated, calculated results predicting the laser beam minimum waist location were in agreement with measured values and more consistent using the curve-fit technique than the two-point evaluation technique.

8277 (SAND–94-2531C) **High-performance GaAs/AlGaAs optical modulators: Their performance and packaging for microwave photonic integrated circuits.** Kravitz, S.H. (and others); Hietala, V.M.; Vawter, G.A. Sandia National Labs., Albuquerque, NM (United States). [1994]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941247–1: 1994 Asia-Pacific microwave conference, Tokyo (Japan), 6-9 Dec 1994). Order Number DE95004533. Source: OSTI; NTIS; GPO Dep.

The goal of this effort is to build and package photonic integrated circuits (PICs). This infers that compact device design is very important, with all building blocks of the circuit aimed toward integration, low voltage operation, and manufacturability. With such a device, it is important that optical packaging by considered in the initial design. To this end, an advanced photonic packaging concept was designed. This concept employs vertical coupling of light both in and out of the package. This package concept is aimed at hermeticity, with no fiber penetrations through the walls of the package. This paper will describe the building blocks of this package, including output gratings, binary optics, and an automatic fiber capture device, called CLASP.

8278 (SAND–94-2731) **Transient radiation-induced absorption in materials for the DOI laser.** Brannon, P.J. Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95004549. Source: OSTI; NTIS; GPO Dep.

This is the final report on a series of experiments concerned with transient radiation-induced absorption in materials for a Cr,Nd:GSGG laser. Both the Sandia National Laboratories SPR III pulsed reactor and the Hermes III pulsed X-ray machine are used as radiation sources. The time dependence and the magnitude of the induced absorption in filter glasses and in doped and undoped $LiNbO_3$ Q-switch materials have been measured. Gain has been observed in Cr,Nd:GSGG, the laser medium, when it is irradiated by X-rays.

8279 (SAND–94-2922C) **Micro heat spreader enhanced heat transfer in MCMs.** Shen, D.S.; Mitchell, R.T.; Dobranich, D.; Adkins, D.R.; Tuck, M.R. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950154–1: Multi chip module conference, Santa Cruz, CA (United States), 31 Jan - 2 feb 1995). Order Number DE95004520. Source: OSTI; NTIS; GPO Dep.

The peak thermal power generated in microelectronics assemblies has risen from less than 1 W/cm^2 in 1980 to greater than 40 W/cm^2 today, due primarily to increasing densities at both the IC and packaging levels. The authors have demonstrated enhanced heat transfer in a prototype Si substrate with a backside micro heat channel structure. Unlike conventional micro heat pipes, these channels are biaxial with a greater capacity for fluid transfer. Thermal modeling and preliminary experiments have shown an equivalent increase in substrate thermal conductivity to over 500 W/m·K, or a four times improvement. Optimization of the structure and alternative liquids will further increase the thermal conductivity of the micro heat channel substrate with the objective being polycrystalline diamond, or about 1,200 W/m·K. The crucial design parameters for the micro heat channel system and the thermal characteristics of the system will be covered.

8282 (BNL–60283) **Concepts and techniques: Active electronics and computers in safety-critical accelerator operation.** Frankel, R.S. Brookhaven National Lab., Upton, NY (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941061–12: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95003946. Source: OSTI; NTIS; INIS; GPO Dep.

The Relativistic Heavy Ion Collider (RHIC) under construction at Brookhaven National Laboratory, requires an extensive Access Control System to protect personnel from Radiation, Oxygen Deficiency and Electrical hazards. In addition, the complicated nature of operation of the Collider as part of a complex of other Accelerators necessitates the use of active electronic measurement circuitry to ensure compliance with established Operational Safety Limits. Solutions were devised which permit the use of modern computer and interconnections technology for Safety-Critical applications, while preserving and enhancing, tried and proven protection methods. In addition a set of Guidelines, regarding required performance for Accelerator Safety Systems and a Handbook of design

criteria and rules were developed to assist future system designers and to provide a framework for internal review and regulation.

8283 (BNL–61014) **Possible use of the AGS linac for proton therapy.** Alessi, J.G.; Chanana, A.; Dilmanian, F.A.; Lee, Y.Y.; Raparia, D.; Tuozzolo, J.; Wielopolski, L. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9411160–1: 21. proton therapy cooperative group (PTCOG) meeting, Chiba (Japan), 14-16 Nov 1994). Order Number DE95003959. Source: OSTI; NTIS; INIS; GPO Dep.

The BNL 200 MeV linac presently provides beam for the AGS high energy physics program and for isotope production at the Brookhaven Linac Isotope Producer (BLIP) facility. There is now a proposal to develop a proton therapy facility which would also use the linac beam. Approximately 1% of the current in each linac beam pulse would be diverted from BLIP, down an existing transport line, to the proposed new facility. This paper focuses on the basic design of the facility, particularly the accelerator issues. The planned transport line layout is presented, along with a description of the energy and intensity control, and beam delivery systems. In the initial phase, we are planning one 360° vertical gantry and one horizontal treatment room.

8284 (BNL–61267) **A high-energy high-luminosity $\mu^+ - \mu^-$ collider.** Neuffer, D.V. (Continuous Electron Beam Accelerator Facility, Newport News, VA (United States)); Palmer, R. Brookhaven National Lab., Upton, NY (United States). Jun 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-940618–116: 4. European particle accelerator conference, London (United Kingdom), 27 Jun - 1 jul 1994; CAP–109-MUON-94C). Order Number DE95006097. Source: OSTI; INIS; NTIS; GPO Dep.

We present a candidate design for a high-energy high luminosity μ^+-μ collider, with E_{cm} = 4 TeV, L = 10^{34} $cm^{-2}S^{-1}$, using only existing technology. The design uses a rapid-cycling medium-energy proton synchrotron, which produces proton beam pulses which are focused onto two π- producing targets, with two π-decay transport lines producing μ^+'s and μ^-'. The μ's are collected, rf-rotated, cooled and compressed into a recirculating linac for acceleration, and then transferred into a storage ring collider. The keys to high luminosity are maximal μ collection and cooling; innovations with these goals are included.

8285 (DOE/ER/40128–T8) **Inverse Cerenkov LPA experiments. 1986 Annual report.** Spectra Technology, Inc., Bellevue, WA (United States). 16 Dec 1986. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-83ER40128. Order Number DE95004622. Source: OSTI; NTIS; GPO Dep.

This report discusses the progress made on laser particle acceleration. First a brief discussion of the collaboration with the University of California at Santa Barbara to examine the technical trade-offs involved in the choice of an inverse Cerenkov (IC) demonstration experiment. The goals of the IC demonstration experiment are to show the applicability of the IC mechanism to electron beam focusing and acceleration. The second part of this report covers glancing incidence measurements of mirrors. The work being performed centers around the issue of dielectric overcoats on metal mirrors. In any type of laser particle accelerator careful consideration of the timing, phasing, and alignment between laser and particle beams must be incorporated in a complete system study. Analysis of these problems has been initiated and a survey of preliminary results are covered in the last part of this report. During this year, Spectra Technology Inc. (STI) has collaborated with Prof. Jorge Fontana, of the University of California, Santa Barbara (UCSB), to examine the technical trade-offs involved in the choice of an inverse Cerenkov (IC) demonstration experiment. Prof. Fontana's responsibilities have been to address the rationale and requirements for the demonstration experiment, including an evaluation and selection of the most attractive test site and facilities. At STI, the options available for the laser and optics, needed to satisfy these requirements, are being examined. The goals of this IC demonstration experiment are to show the applicability of the IC mechanisms to electron beam focusing and acceleration.

8286 (DOE/ER/40128–T9) **Inverse Cerenkov laser accelerator experiment annual report. 1990 Annual report.** Spectra Technology, Inc., Bellevue, WA (United States). 29 Mar 1991. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-83ER40128. Order Number DE95004623. Source: OSTI; NTIS; GPO Dep.

During the past year further progress was made on preparations for the Spectra Technology, Inc. (STI) inverse Cerenkov acceleration (ICA) experiment to be performed on the Accelerator Test Facility (ATF) at Brookhaven National Laboratory. Major progress was made in the design and fabrication of the experimental apparatus. This includes the gas cell, where the ICA process occurs, and the optical system that converts the CO_2 laser beam into a radially polarized beam. In terms of progress on theoretical work, the authors finished optimizing the ATF ICA design parameters using their Monte Carlo computer simulation. The optimized design predicts for the ATF conditions that over 50% energy gain should be observed. They published a paper on an improved method of performing ICA by operating near the resonance of a gas. They also began analysis of a method of accelerating particles in a vacuum using a radially polarized beam and axicon focusing. Although this new method can no longer be considered ICA, it has the potential of high acceleration gradients without the drawbacks of gas scattering and gas breakdown. Three papers were published and two conference papers were presented during 1990.

8287 (DOE/ER/40128–T10) **100 MeV laser accelerator demonstration and 1 GeV baseline design development. 1992 Annual report.** STI Optronics, Bellevue, WA (United States). 1 Dec 1992. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-83ER40128. Order Number DE95004624. Source: OSTI; NTIS; INIS; GPO Dep.

The acceleration of relativistic electrons using the inverse Cerenkov effect was first demonstrated at Stanford University in 1981. Later, Fontana and Pantell developed an improved configuration for the inverse Cerenkov acceleration (ICA) process. A radially polarized laser beam is focused by an axicon onto the e-beam traveling through a gas-filled interaction region. The light intersects the e-beam at the Cerenkov angle θ_c, where $\theta_c = \cos^{-1}(1/n\beta)$, n is the index of refraction of the gas, and β is the ratio of the electron velocity to the speed of light. The goal of the present program is to demonstrate improved laser acceleration using the Fontana and Pantell configuration. The experiments will be performed on the Accelerator Test Facility (ATF) located at Brookhaven National Laboratory (BNL). This facility features a 50 MeV linac fed by a Nd:YAG (4ω) laser-driven photocathode e-gun. It will be upgraded to 65 MeV in the near future. The ATF also has a high peak power CO_2 laser, which was developed for laser acceleration studies. The present ICA experiment was divided into two phases. Phase 1 was to examine certain experimental issues in preparation for Phase 2. Phase 1 was successfully completed in the spring of 1992. Phase 2 is to perform the actual laser acceleration experiments on the ATF e-beam. The authors are currently waiting for the availability of the e-beam so that they can begin the Phase 2 experiments. In this section, the theory and experimental hardware for the present program are described. The results of the Phase 1 experiments are presented, and an update on the Phase 2 experiment is given.

8288 (JINR-D–15-93-80) **Microtron MT-25. Workshop on application of microtrons in nuclear physics.** Gangrskij, Yu.P. (ed.). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 119p. (In Russian). (CONF-9209490–: Workshop on application of microtrons in nuclear physics, Plovdiv (Bulgaria), 22-24 Sep 1992). Order Number DE95611718. Source: OSTI; NTIS (US Sales Only); INIS.

Problems of development of microtron equipment and construction of microtrons at scientific centers of JINR country-members are discussed. Results of experimental conducted in microtron beams are presented in the directions of photonuclear reactions, fission reactions, activation analysis.

8289 (JINR-D–15-93-80, pp. 6-11) **Present status on organization of nuclear-physical laboratory 'MICROTRON' in Plovdiv University.** Belov, A.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Cholakov, V.D.; Srents, A.K.; Khristov, Kh.G.; Balabanov, N.P. Joint Inst. for Nuclear Research,

Dubna (Russian Federation). 1993. 119p. (In Russian). (CONF-9209490–: Workshop on application of microtrons in nuclear physics, Plovdiv (Bulgaria), 22-24 Sep 1992). In *Microtron MT-25. Workshop on application of microtrons in nuclear physics.* Order Number DE95611718. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes the status of the development and construction of a microtron in Plovdiv, Bulgaria, in cooperation with the Laboratory of nuclear reactions in Dubna, Russia. The schedule takes into account the application of powerful bremsstrahlung and neutron radiation. Maximum electron energy -25 MeV; average current of accelerated electrons - 25 μA. The area of the laboratory building - 1000 m^2. 8 refs., 1 tab.

8290 (JINR-D–15-93-80, pp. 12-19) **Microtron MT-25. (Electromagmet design, operating experience).** Belov, A.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)). Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 119p. (In Russian). (CONF-9209490–: Workshop on application of microtrons in nuclear physics, Plovdiv (Bulgaria), 22-24 Sep 1992). In *Microtron MT-25. Workshop on application of microtrons in nuclear physics.* Order Number DE95611718. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes the results of operations at MT-22 microtron carried out to produce ^{123}I, ^{11}C, ^{15}O and ^{13}N radioisotopes via increase of the number of orbits. 25 MeV MT-25 microtron operation experience is described. MT-25 microtron operated for about 5000 hours. All operation problems reside in the replacement of the magnetron, SHF-generator bulb, resonator and some vacuum seals. 9 refs., 4 figs., 2 tabs.

8291 (JINR-D–15-93-80, pp. 20-25) **Microtron MT-25 and its areas of use.** Belov, A.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions); Buklanov, G.V.; Korotkin, Yu.S.; Oganessian, Yu.Ts.; Starodub, G.Ja.; Zhuchko, V.E. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 119p. (CONF-9209490–: Workshop on application of microtrons in nuclear physics, Plovdiv (Bulgaria), 22-24 Sep 1992). In *Microtron MT-25. Workshop on application of microtrons in nuclear physics.* Order Number DE95611718. Source: OSTI; NTIS (US Sales Only); INIS.

Microtron MT-25 fields of application are described. The microtron was built in 1972 at JINR and during 20 years some changes in construction have been made. Now in MT-25 electron beam energy attained 25 MeV and beam current equals to 20 mA. One of the main applications is the determination of gold content in geological and technological samples. The production of I^{123} of total activity about 20-40 Ci for a year is the second use of MT-25. 7 refs., 2 figs.

8292 (JINR-D–15-93-80, pp. 26-31) **Project of a laboratory for activation analysis on the basis of microtron MPR.** Baatarkhuu, D. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Belov, A.G.; Gehrbish, Sh.; Zhuchko, V.E.; Sehrgehlehn, B.; Teterev, Yu.G.; Sodnom, N.; Sirazhet, Kh. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 119p. (In Russian). (CONF-9209490–: Workshop on application of microtrons in nuclear physics, Plovdiv (Bulgaria), 22-24 Sep 1992). In *Microtron MT-25. Workshop on application of microtrons in nuclear physics.* Order Number DE95611718. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes MT-22 microtron and the design of the Activation Analysis Laboratory of the Mongolian People's Republic. The measurement-computation complex will be built on the basis of MIK-1 microcomputer and IBM XT PC. The microtron enables production of ^{123}I for medical diagnostics. 13 refs., 5 figs.

8293 (KAERI/RR–1213/92) **Development of high power free-electron lasers.** Lee, Jong Min (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Nam, Chang Hee; Hwang, Cheol Kyu; Choi, Byeong Ho; Cha, Hyeong Ki; Cha, Byeong Heon; Kim, Seong Ho; Lee, Byeong Cheol; Jeong, Ki Seok; Kim, Wan; Jin, Jeong Tae; Kim, Seon Kook; JeKorea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1992. 174p. (In Korean). Order Number DE95612722. Source: OSTI; NTIS; INIS.

A Millimeter Wave Free-Electron Laser has been designed and constructed. A Nd:glass laser has been constructed and the experiment of APM has been conducted for the development of the ultrashort high power laser. (Author).

8294 (LA-UR–94-4168) **An FEL design code running on Mathcad™.** Nguyen, D.C. (Los Alamos National Lab., NM (United States)); Gierman, S.M.; O'Shea, P.G. Los Alamos National Lab., NM (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9408196–2: FEL '94: nuclear instrument methods, Stanford, CA (United States), 21-26 Aug 1994). Order Number DE95005279. Source: OSTI; NTIS; INIS; GPO Dep.

We present a simple computer code called FEL-CAD that runs on the Mathcad™ software. FEL-CAD gives estimates of the expected performance of a low-gain Compton FEL oscillator driven by an rf linac. The code provides fast, albeit approximate, answers to basic FEL design questions. Scaling can be done by varying the wiggler, the linac, the electron beam and the optical resonator parameters.

8295 (LBL–36343) **Exotic colliders.** Chattopadhyay, S. Lawrence Berkeley Lab., CA (United States). Nov 1994. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CBP–106; CONF-940681–6: Advanced accelerator concepts workshop, Lake Geneva, WI (United States), 13-18 Jun 1994). Order Number DE95004668. Source: OSTI; NTIS; INIS; GPO Dep.

The motivation, feasibility and potential for two unconventional collider concepts - the Gamma-Gamma Collider and the Muon Collider - are described. The importance of the development of associated technologies such as high average power, high repetition rate lasers and ultrafast phase-space techniques are outlined.

8296 (SLAC-PUB–6338) **Future accelerators and experiments.** Richter, B. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Aug 1993. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-8806240–2: Landau memorial conference on frontiers of physics, Tel Aviv (Israel), 6-10 Jun 1988). Order Number DE95005940. Source: OSTI; NTIS; INIS; GPO Dep.

This article describes the status of major new accelerator projects and prospects as of mid 1988. It looks at hadron colliders and electron positron colliders. The author looks both at the technology of the machines, and how it will have to be developed for future devices, and the effort required to extract the important physics information from the resulting reaction cascades which are exected to come out of these devices.

8297 (SLAC-PUB–6646) **Linear collider research and development.** Siemann, R.H. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Aug 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9408125–45: 17. international LINAC conference, Tsukuba (Japan), 21-26 Aug 1994). Order Number DE95006059. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a review of work being done on the design of linear colliders with center of mass energies near 0.5 TeV. These include TESLA, SBLC, NLC, JLC, VLEPP, and CLIC. Here the author touches on recent advances made on these designs. Items discussed include advances in the study of beam focusing and spot sizes in setups such as the Final Focus Test Beam, bunching concepts, development of high power RF systems, design of high gradient accelerator structures, and work on emittance features.

8298 (ANL/APS/TB–20) **Bremsstrahlung scattering calculations for the beam stops and collimators in the APS insertion-device beamlines.** Job, P.K.; Haeffner, D.R.; Shu, D. Argonne National Lab., IL (United States). Dec 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95005471. Source: OSTI; NTIS; INIS; GPO Dep.

Bremsstrahlung is produced in the APS storage ring by the interaction of positrons with the residual gas molecules in the vacuum chamber of the storage ring. The bremsstrahlung production causes a serious challenge in shielding the insertion-device beamlines because the entire straight section (15 meters) is in the line of sight of the beamline. The radiation emerges in a narrow cone tangential to the beam path with the characteristic emission angle $1/\gamma$, where γ is E/mc^2 which is the ratio of the kinetic energy to the rest mass for the positrons. This high-energy gamma radiation has an approximate 1/E spectrum with the maximum energy extending up to the particle energy (7 GeV for the APS). Bremsstrahlung, being high-energy photons, produces an electromagnetic shower when it encounters the beamline elements. A beamline element not thick enough to fully contain an electromagnetic shower can cause considerable scatter of the high-energy bremsstrahlung radiation. The low-energy component of the bremsstrahlung can also be scattered and create high dose rates in the first-optical and white-beam enclosures. The fully developed electromagnetic shower will have a photon spectrum almost independent of the material. The electromagnetic showers in the high-Z materials can also produce photoneutrons. This note reports the summary of EGS4 calculations performed on bremsstrahlung scattering from different beamline components in a typical APS insertion-device beamline. The related recommendations for shielding are also given. The shielding criterion adopted is a total dose rate of 2.5μSv/h (0.25 mrem/h) at 30 cm from the shield.

8299 (BNL–60999) **Proposal for using optical transition radiation for electron beam alignment and emittance measurement for the free emittance measurement for the free electron laser experiments at ATF.** Qiu, Xu Z.; Wang, Xijie; Ben-Zvi, I. Brookhaven National Lab., Upton, NY (United States). Oct 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95005004. Source: OSTI; NTIS; INIS; GPO Dep.

Optical transiton radiation (OTR) produced from thin intercepting foils have been employed to image the spatial profile of the electron beam in several free electron laser experiments. It was found that the images from OTR were significantly sharper than the images produced from phosphor screens. Furthermore, OTR's sensitivity of its angular distribution and polarization to energy and divergence of the electron beam was exploited to diagnose energy and emittance of the electron beam. OTR has been proven to be vital in electron beam alignment in FEL experiments. This report gives a summary of the basic theory of transition radiation and techniques using transition radiation for electron beam imaging and emittance measurement. The possibility was explored for employing these techniques in the HGHG FEL and the visible FEL experiments in ATF (Accelerator Test Facility).

8300 (BNL–61007) **Crystalline beams: Theory, experiments, and proposals.** Ruggiero, A.G. Brookhaven National Lab., Upton, NY (United States). [1995]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9406292–1: INFN elosiatron workshop on quantum-like models and coherent effects, Erice (Italy), 13-20 Jun 1994). Order Number DE95003955. Source: OSTI; NTIS; INIS; GPO Dep.

Crystalline Beams are an ordered state of an ensemble of ions, circulating in a storage ring, with very small velocity fluctuations. They can be obtained from ordinary warm ion beams with the application of intense cooling techniques (stochastic, electron, laser). A phase transition occurs when sufficiently small velocity spreads are reached, freezing the particle-to-particle spacing in strings, Zigzags, and helices ... The properties and the feasibility of Crystalline Beams depend on the choice of the lattice of the Storage Ring. There are three issues closely related to the design of the Storage Ring; namely: the determination of Equilibrium Configurations, Confinement Conditions, and Stability Conditions. Of particular concern is the effect of the trajectory curvature and of the beam momentum spread, since they set the requirements on the amount of momentum cooling, on the focussing, and on the distribution of bending in the lattice of the storage ring. The practical demonstration of Crystalline Beams may create the basis for an advanced technology for particle accelerators, where the limitations due to Coulomb intrabeam scattering and space-charge forces would finally be brought under control, so that beams of ions, more dense than normal, can be achieved for a variety of new applications.

8301 (LA-UR–94-3753) **Self-consistent beam halo studies & halo diagnostic development in a continuous linear focusing channel.** Jameson, R.A. Los Alamos National Lab., NM (United States). 1994. 25p. Sponsored by European Organization for Nuclear Research, Geneva (Switzerland). DOE Contract W-7405-ENG-36. (CONF-941186–1: Joint US-CERN-Japan topical course on accelerator physics and technology: frontiers of accelerator technology, Maui, HI (United States), 3-9 Nov 1994). Order Number DE95003706. Source: OSTI; NTIS; INIS; GPO Dep.

Beam halos are formed via self-consistent motion of the beam particles. Interactions of single particles with time-varying density distributions of other particles are a major source of halo. Aspects of these interactions are studied for an initially equilibrium distribution in a radial, linear, continuous focusing system. When there is a mismatch, it is shown that in the self-consistent system, there is a threshold in space-charge and mismatch, above which a halo is formed that extends to ~1.5 times the initial maximum mismatch radius. Tools are sought for characterizing the halo dynamics. Testing the particles against the width of the mismatch driving resonance is useful for finding a conservative estimate of the threshold. The exit, entering and transition times, and the time evolution of the halo, are also explored using this technique. Extension to higher dimensions is briefly discussed.

8302 (LBL–36024) **Parallel computation of automatic differentiation applied to magnetic field calculations.** Hinkins, R.L. (Univ. of California, Berkeley, CA (United States). Computer Science Dept.). Lawrence Berkeley Lab., CA (United States). Sep 1994. 26p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00098. Grant CDA-8722788. Order Number DE95004689. Source: OSTI; NTIS; INIS; GPO Dep.

The author presents a parallelization of an accelerator physics application to simulate magnetic field in three dimensions. The problem involves the evaluation of high order derivatives with respect to two variables of a multivariate function. Automatic differentiation software had been used with some success, but the computation time was prohibitive. The implementation runs on several platforms, including a network of workstations using PVM, a MasPar using MPFortran, and a CM-5 using CMFortran. A careful examination of the code led to several optimizations that improved its serial performance by a factor of 8.7. The parallelization produced further improvements, especially on the MasPar with a speedup factor of 620. As a result a problem that took six days on a SPARC 10/41 now runs in minutes on the MasPar, making it feasible for physicists at Lawrence Berkeley Laboratory to simulate larger magnets.

8303 (LBL–36180) **Design study of longitudinal dynamics of the drive beam in 1 TeV relativistic klystron two-beam accelerator.** Li, H.; Yu, S.S.; Sessler, A.M. Lawrence Berkeley Lab., CA (United States). Oct 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-941101–2: Meeting of the Division of Plasma Physics of the American Physical Society, Minneapolis, MN (United States), 7-11 Nov 1994). Order Number DE95004683. Source: OSTI; NTIS; INIS; GPO Dep.

In this paper the authors present a design study on the longitudinal dynamics of a relativistic klystron two-beam accelerator (RK-TBA) scheme which has been proposed as a power source candidate for a 1 TeV next linear collider (NLC). They address the issue of maintaining stable power output at desired level for a 300-m long TBA with 150 extraction cavities and present their simulation results to demonstrate that it can be achieved by inductively detuning the extraction cavities to counter the space charge debunching effect on the drive beam. They then carry out simulation study to show that the beam bunches desired by the RK-TBA can be efficiently obtained by first chopping an initially uniform beam of low energy into a train of beam bunches with modest longitudinal dimension and then using the "adiabatic capture" scheme to bunch and accelerate these beam bunches into tight bunches at the operating energy of the drive beam. The authors have also examined

the "after burner" scheme which is implemented in their RK-TBA design for efficiency enhancement.

8304 (LBL–36233) **Design study of beam dynamics issues for 1 TeV next linear collider based upon the relativistic-klystron two-beam accelerator.** Li, H. (Lawrence Berkeley Lab., CA (United States)); Goffeney, N.; Henestroza, E.; Sessler, A.; Yu, S.; Houck, T.; Westenskow, G. Lawrence Berkeley Lab., CA (United States). Nov 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-940681–5: Advanced accelerator concepts workshop, Lake Geneva, WI (United States), 13-18 Jun 1994). Order Number DE95004673. Source: OSTI; NTIS; INIS; GPO Dep.

A design study has recently been conducted for exploring the feasibility of a relativistic-klystron two-beam accelerator (RK-TBA) system as a rf power source for a 1 TeV linear collider. The author present, in this paper, the beam dynamics part of this study. They have achieved in their design study acceptable transverse and longitudinal beam stability properties for the resulting high efficiency and low cost RK-TBA.

8305 (LBL–36302) **The cooling of particle beams.** Sessler, A.M. Lawrence Berkeley Lab., CA (United States). Oct 1994. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-9411120–3: 4. Tamura symposium on accelerator physics, Austin, TX (United States), 14-16 Nov 1994). Order Number DE95004669. Source: OSTI; NTIS; INIS; GPO Dep.

A review is given of the various methods which can be employed for cooling particle beams. These methods include radiation damping, stimulated radiation damping, ionization cooling, stochastic cooling, electron cooling, laser cooling, and laser cooling with beam coupling. Laser Cooling has provided beams of the lowest temperatures, namely 1 mK, but only for ions and only for the longitudinal temperature. Recent theoretical work has suggested how laser cooling, with the coupling of beam motion, can be used to reduce the ion beam temperature in all three directions. The majority of this paper is devoted to describing laser cooling and laser cooling with beam coupling.

8306 (SLAC-PUB–6527) **Depolarization in the SLC Collider Arcs.** Emma, P. (Stanford Univ., CA (United States). Stanford Linear Accelerator Center); Limberg, T.; Rossmanith, R. Stanford Linear Accelerator Center, Menlo Park, CA (United States); Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility. Jun 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515 ; AC05-84ER40150. (CONF-940618–115: 4. European particle accelerator conference, London (United Kingdom), 27 Jun - 1 jul 1994). Order Number DE95005942. Source: OSTI; NTIS; INIS; GPO Dep.

In the 1993 running cycle of the Stanford Linear Collider, electron spin polarization measurements with a Moller polarimeter at the end of the linac and a Compton polarimeter near the interaction point (IP) indicated a relative polarization loss of up to 20% across the arc. The authors present calculations of the depolarizing effects where variations in energy, energy spread and transverse emittance as well as changes in orbit and initial spin orientation are taken into account. They compare their results with measurements and conclude that, in standard operating conditions, the relative polarization loss is only 3±2%.

8307 (SLAC-PUB–6604) **Over-compression, a method to shape the longitudinal bunch distribution for a reduced energy spread.** Decker, F.J.; Holtzapple, R.; Raubenheimer, T. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jul 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9408125–46: 17. international LINAC conference, Tsukuba (Japan), 21-26 Aug 1994). Order Number DE95006052. Source: OSTI; NTIS; INIS; GPO Dep.

In the Stanford Linear Collider the energy spread of the bunches at the end of the linac is dominated by longitudinal wakefields. A short, high current bunch with a Gaussian shape will produce a double-horned energy distribution. It can be shown that certain charge distributions with a sharp rise time (about rectangular or half-Gaussian) will give no additional energy spread due to the linac, since the generated wakefield and the rf-curvature cancel each other exactly. In this paper different methods are presented on how to achieve such distributions by using non-linear dependences in the RTL (Ring-To-Linac) compression region. A simple and effective method to achieve such a distribution is by over-compression. When not fully compressing the bunch, there are two settings of the compressor voltage, under and over-compression, which give the same core bunch length in the linac. By switching from the under to the over-compressed setting, the tails are reduced from more than Gaussian to less than Gaussian beam tails. This results in a roughly rectangular shape which will give the wakefield-rf cancellation. Simulations, measurements and their implications are discussed.

8308 (SLAC-PUB–6621) **Tutorial on beam-based feedback systems for linacs.** Hendrickson, L.; Allison, S.; Gromme, T.; Grossberg, P.; Himel, T.; Krauter, K.; MacKenzie, R.; Ross, M.; Sass, R.; Shoaee, H. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Aug 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9408125–48: 17. international LINAC conference, Tsukuba (Japan), 21-26 Aug 1994). Order Number DE95006054. Source: OSTI; NTIS; INIS; GPO Dep.

A generalized fast feedback system stabilizes beams in the SLC. It performs measurements and modifies actuator settings to control beam states such as position, angle, energy and intensity on a pulse to pulse basis. An adaptive cascade feature allows communication between a series of linac loops, avoiding overcorrection problems. The system is based on the state space formalism of digital control theory. Due to the database-driven design, new loops are added without requiring software modifications. Recent enhancements support the monitoring and control of nonlinear states such as beam phase using excitation techniques. In over three years of operation, the feedback system has grown from its original eight loops to more than fifty loops, and it has been invaluable in stabilizing the machine.

8309 (ANL/MSD/CP–82826) **Cryogenic monochromator as a solution to undulator heat loads at third generation synchrotron sources.** Knapp, G.S.; Rogers, C.S.; Beno, M.A.; Jennings, G.; Cowan, P.L. Argonne National Lab., IL (United States). Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-940714–46: International meeting on synchrotron radiation instrumentation, Stony Brook, NY (United States), 18-22 Jul 1994). Order Number DE95004647. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed a new design for a cryogenically cooled monochromator employing a thin-crystal strategy which is capable of handling the central-cone power of the Advanced Photon Source's Undulator A at closed gap and at the full design current of 300 mA. We have designed and fabricated a Si (111) crystal which has a thin section where the x-rays hit and has internal cooling channels. A invar manifold has also been designed and it will be attached to the Si via In gaskets. We have done detailed modeling, both with approximate analytical and with finite element calculations. The results shown that our design has negligible thermal strain even for closed gap operation.

8310 (BNL–52435) **Lasers for RF guns: Proceedings.** Srinivasan-Rao, T. (ed.). Brookhaven National Lab., Upton, NY (United States). [1994]. 153p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9405276–: Lasers for RF guns, Anaheim, CA (United States), 14-15 May 1994). Order Number DE95004856. Source: OSTI; NTIS; INIS; GPO Dep.

In the past decade, laser driven RF guns have matured from a device under development to a proven source for high brightness and low emittance electron beams. The reliability of the electron beam from these sources is dictated by the laser system that drives it. In addition, capabilities of the laser systems play a vital

role in the design of the electron source for future machines such as the TESLA and NLC. The purpose of this workshop was to provide a forum for discussing the design criteria for the laser systems so that the reliability of the existing sources could be improved and the future machines could be serviced. The Workshop brought together experts in RF Guns, accelerators, and lasers, from both the commercial and academic community. Most of the presentations, discussions and conclusions at the workshop are included in these proceedings. The contents are divided into three sections, Section I contains the invited talks that outline the requirements of the RF Guns and the capabilities of the laser systems to meet these requirements. Section II includes most of the papers presented in the poster session. These papers describe various laser systems used with electron guns, schemes to modify the laser beam profile to optimize the electron bunch, and computer simulations of electron trajectories. Section III contains the summaries of the working groups. As the summary section indicates, with sufficient feed back systems, the electron gun could be made to operate reliably with minimum downtime, using commercial lasers currently available. The design of laser systems for future colliders depend critically on the choice of the cathode m the gun and its efficiency. Tentative designs of laser systems for the TESLA test facility and LCLS had been drawn assuming a copper cathode. Using a more efficient cathode will ease the energy requirement of the laser and simplify the design. The individual papers have been cataloged separately elsewhere.

8311 (BNL–61019) **NSLS control system upgrade.** Smith, J.D.; Ramamoorthy, S.; Tang, Yong N. Brookhaven National Lab., Upton, NY (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-931023–13: ICALEPCS'93: International conference on accelerators and large experimental physics control systems, Berlin (Germany), 18-22 Oct 1993). Order Number DE95003949. Source: OSTI; NTIS; INIS; GPO Dep.

The NSLS consists of two storage rings, a booster and a linac. A major upgrade of the control system (installed in 1978) was undertaken and has been completed. The computer architecture is being changed from a three level star-network to a two level distributed system. The microprocessor subsystem, host computer and workstations, communication link and the main software components are being upgraded or replaced. Since the NSLS rings operate twenty four hours a day a year with minimum maintenance time, the key requirement during the upgrade phase is a non-disruptive transition with minimum downtime. Concurrent with the upgrade, some immediate improvements were required. This paper describes the various components of the upgraded system and outlines the future plans.

8312 (BNL–61053) **Operation of a small-gap undulator on the NSLS X-ray Ring.** Stefan, P.M.; Krinsky, S.; Rakowsky, G.; Solomon, L. Brookhaven National Lab., Upton, NY (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950261–1: Contribution for Halbach Festschrift, Berkeley, CA (United States), 3 Feb 1995). Order Number DE95004841. Source: OSTI; NTIS; INIS; GPO Dep.

We report results of an on-going experiment being carried out in the X13 straight section of the NSLS X-ray Ring which explores the limits of the operation of small-gap undulators. In particular, we discuss the operation of a 16 mm period small-gap undulator. At an electron beam current of 300 mA the variable gap vacuum chamber has been closed to an inner aperture of 3.8 mm with no effect on the electron beam lifetime. Measurements of the output radiation spectrum at a magnet gap of 7.5 mm are described.

8313 (DOE/ER/40150–281) **Superharp: A wire scanner with absolute position readout for beam energy measurement at CEBAF.** Yan, C. Southeastern Universities Research Association, Inc., Newport News, VA (United States). Continuous Electron Beam Accelerator Facility. 7 Sep 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84ER40150. (CEBAF-R–94-002). Order Number DE95005905. Source: OSTI; NTIS; INIS; GPO Dep.

Superharp is an upgrade CEBAF wire scanner with absolute position readout from shaft encoder. As high precision absolute beam position probe ($\Delta x \sim 10\mu m$), three pairs of superharps are installed at the entrance, the mid-point, and the exit of Hall C arc beamline in beam switch yard, which will be tuned in dispersive mode as energy spectrometer performing 10^{-3} beam energy measurement. With dual sensor system: the direct current pickup and the bremsstrahlung detection electronics, beam profile can be obtained by superharp at wide beam current range from 1 μA to 100 μA.

8314 (IFVE-OMVT–92-123) **Algorithm for model-based diagnosis of the beam line.** Ukhov, V.I. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 15p. (In Russian). Order Number DE95612752. Source: OSTI; NTIS (US Sales Only); INIS.

An algorithm based on the model of derivative matrix for the functional diagnosis of linear magneto-optical structures (MOS) is described. The algorithm uses artificial intelligence elements and is designed to operate in the operator time scale. The algorithm described is realized as a module in the program for tuning and diagnosis of linear MOS. The parameters of the U-70 accelerator beam extraction system are included into one of the models. 8 refs.; 4 figs.

8317 (INIS-mf–14452) **Study of the Reflex-Klystron.** Valencia A, R. Instituto Politecnico Nacional, Mexico City (Mexico). Escuela Superior de Ingenieria Mecanica y Electrica. 1981. 84p. (In Spanish). Order Number DE95615824. Source: OSTI; NTIS (US Sales Only); INIS.

The main purpose of this paper is the theoretical study and the development of a technique for designing. A low power Reflex-Klystron, in order to construct it in the graduated section laboratories of the Instituto Politecnico Nacional. It is pretended to attain a power of 15-45 m W in frequencies of 8-10 GHz with low acceleration potentials (300-400 V) and electric current of 15-25 m A; the device will be mechanically tuned and will have a fine tuning through the potential of the reflector (150-180 V negative with respect to the resonator). The International System of Units is used in this thesis. (Author).

Fiziki Vysokikh Ehnergij. 1991. (CONF-9009329–: Workshop on physics at UNK, Protvino (USSR), 25-28 Sep 1990). In *Third workshop 'Physics at UNK' (Proceedings).* 269p. Order Number DE94607646. Source: OSTI; NTIS (US Sales Only); INIS.

A 3 TeV beam dump experiment on ν_τ-detection to be performed at UNK is described. Status and development of an active target detector are given. 3 refs.

8319 (JINR-D–15-93-80, pp. 32-36) **Microtron as an injector into an electron synchrotron.** Catana, D.; Panaitescu, I.; Axinescu, S.; Minea, R. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 119p. (CONF-9209490–: Workshop on application of microtrons in nuclear physics, Plovdiv (Bulgaria), 22-24 Sep 1992). In *Microtron MT-25. Workshop on application of microtrons in nuclear physics.* Order Number DE95611718. Source: OSTI; NTIS (US Sales Only); INIS.

A preliminary proposal to build a synchrotron radiation source at the Institute of Atomic Physics, Bucharest, Romania is considered. The electron energy is about 200-300 MeV, corresponding to a cut-off wavelength of several hundred angstroms. A comparison with other radiation sources in the same wavelength range is presented. The 17-orbit microtron, now in operation, will be used as injector. The microtron parameters are presented. 4 refs.

8320 (JINR-D–15-93-80, pp. 37-39) **The 17-orbit microtron from the Institute of Atomic Physics, Bucharest.** Catana, D.; Axinescu, S.; Minea, R. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 119p. (CONF-9209490–: Workshop on application of microtrons in nuclear physics, Plovdiv (Bulgaria), 22-24 Sep 1992). In *Microtron MT-25. Workshop on application of microtrons in nuclear physics.* Order Number DE95611718. Source: OSTI; NTIS (US Sales Only); INIS.

The description of the 17-orbit microtron which is in operation from 1977 at the Institute of Atomic Physics, Bucharest is given. The fields of its application are considered.

8321 (JINR-D–15-93-80, pp. 40-46) **Automatized working place of the microtron MT-25 operator.** Ivanov, V.G. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Fernandes Nodarse, F.; Belov, A.G.; Sun'ga, Kh. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1993. 119p. (In Russian). (CONF-9209490–: Workshop on application of microtrons in nuclear physics, Plovdiv (Bulgaria), 22-24 Sep 1992). In *Microtron MT-25. Workshop on application of microtrons in nuclear physics.* Order Number DE95611718. Source: OSTI; NTIS (US Sales Only); INIS.

To reduce training time and to improve operating personnel efficiency, a decision was made to develop an automated workstation of MT-25 microtron operator which will be based on a microcomputer compatible with IBM PC XT/AT, 640 kB RAM, graphic display of an average resolution, Winchester HDD, DOS 3.3. The computer aid which is designed on the basis of the automated workstation and MT-25 microtron is primarily intended for symbolic processes and euristic retrival and features simplicity in updating, changing and expanding. Its application will, probably, enable correct, as a rule, answers, and the system will become a useful supporting or consultative facility for the users of MT-25 microtron workstation. 5 refs., 3 figs.

8322 (JINR-E–9-94-236) **On a Possibility to Construct High-Intensity Monochromatic Gamma-Source at HERA and LEP.** Saldin, E.L. (Automatic Systems Corporation, Samara (Russian Federation)); Shnejdmiller, E.A.; Ul'yanov, Yu.N.; Sarantsev, V.P.; Shimanskij, S.S.; Yurkov, M.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 12p. Order Number DE95612760. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Instruments and Methods in Physics Research. Section A, Accelerators, Spectrometers, Detectors and Associated Equipment.

A possibility to construct high-intensity tunable monochromatic γ-source at HERA and LEP (LEP-2) is discussed. It is proposed to produce γ-quanta by means of Compton backscattering of laser photons on electrons of the collider. The laser light wavelength is chosen in such a way that after the scattering, the electron does not leave the separatrix. So as the probability of the scattering is rather small, energy oscillations are damped prior the next scattering. As a result, the proposed source can operate in 'parasitic' mode not interfering with the main mode of the collider operation. It is proposed to install at the colliders HERA and LEP tunable free-electron lasers operating at 100-400 μm wavelength band with the peak and average output power $\approx$ 10 MW and $\approx$ 1 kw, respectively. It will result in the intensity of the γ-source $\approx 10^{14}$ s^{-1} with tunable γ-quantum energy up to 150 MeV, 250 MeV and 500 MeV for the HERA, LEP and LEP 2, respectively. Such a γ-quantum source will reveal unique possibilities for precision investigations in nuclear physics. 22 refs., 3 figs., 2 tabs.

8323 (JINR-E–9-94-255) **Computer Simulation of Accelerator Beam Extraction with a Bent Crystal.** Taratin, A.M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of High Energy. 1994. 16p. Order Number DE95612753. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Instruments and Mehthods.

The extraction of a 120 GeV proton beam from the SPS with transverse particle diffusion onto a bent crystal deflector has been considered with computer simulation. The asymmetry of extraction efficiency with the crystal orientation relative to the beam direction was observed. It was shown that the crystal deformation in the vertical plane led to a considerable broadening of orientational dependence and also a broadening of the extracted beam and its split. (author). 9 refs.; 11 figs.; 1 tab.

8324 (JINR-R–13-94-213) **Highly Efficient Surface Ionisation Ion Source for Ultra-Trace Detection of Quantities of Radio Toxic Strontium Isotopes.** Yushkevich, Yu.V. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems); Bystrov, V.A.; Novgorodov, A.F.; Zimmer, K.; Kluge, H.Yu.; Otten, E.W.; Wendt, K.; Beyer, G.; Trautmann, N. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. 10p. (In Russian). Order Number DE95612745. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Instruments and Methods.

The aim of the present work was development of a highly efficient surface ionisation ion source for alkaline-earth elements. An ionisation efficiency of strontium up to 60% with a sample of 10^{17} atoms ($\simeq$ 10 mg) and separation time about two hours was reached by means of electron bombardment. The main purpose of this ion source is detection of 10^7 atoms of ^{90}Sr (7mBg) in the presence of a surplus of up to 10^{17} stable strontium atoms. The ion source is used in combination with the fast running atom beam recharge system at the RISIKO facility (Mainz, DE). (author). 5 refs.; 6 figs.; 2 tabs.

8325 (KAERI/RR–1282/93) **A study on the proton beam energy measurement and diagnosis.** Chae, Jong Seo (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Lee, Dong Hoon; Kim, Yoo Seok; Ha, Jang Ho; Park, Chan Won; Lee, Yong Min; Hong, Seong Seok; Lee, Ji Seop; Lee, Min Yong. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 30p. (In Korean). Order Number DE95612754. Source: OSTI; NTIS; INIS.

The main purpose of this project is the measurement of proton beam energy of extraction at RF 25.89 MHz from MC-50 cyclotron, SF type and constructed by Scantronix Co.. Our beam facility can accelerate not only proton, deuteron, helium-3, and alpha particles but also variable energies of each particles. There are three kinds of beam energy measurement method. One of them is the measurement using by magnet (dipole), which is generally used. But our experimental environment give some problems of space for magnet installation and budget. Another method is the measurement by beam stopping range. If the range is measured, then we can reduce the beam energy from measuring range by refering other experimental data and theoretically calculated data. But resolution of this method is poor in general. So the last method is well fit for our case. This method is E-ΔE coincidence measurement. Our detection system is consist of NaI (Tl) for energy measurement of scattered beam from target, and thin plastic sintillation detector for ΔE measurement. Such method gives us the possibilities of particle identification and rejection of gamma background caused by NaI detector. And the reason of using NaI, sensitive gamma rays, is the good linearity of proton beam energy, from 30 MeV to 60 MeV, and light yield of detector, which reported by Romero et al.. We want to give some emphasis on CAMAC data-acquisition system used for two-dimensional data-taking system on real time. Such two dimensional data are required on the identification analysis of scattered particles and selection of proton efficiently.

8326 (SLAC-PUB–95-6745) **Radiation and radiation reaction in continuous focusing channels.** Huang, Zhirong; Chen, Pisin; Ruth, R.D. Stanford Linear Accelerator Center, Menlo Park, CA (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-940681–7: Advanced accelerator concepts workshop, Lake Geneva, WI (United States), 13-18 Jun 1994). Order Number DE95006212. Source: OSTI; NTIS; INIS; GPO Dep.

We show that the radiation damping rate of the transverse action of a particle in a straight, continuous focusing system is independent of the particle energy, and that no quantum excitation is induced. This absolute damping effect leads to the existence of a transverse ground state which the particle inevitably decays to, and yields the minimum beam emittance that one can ever attain, $\gamma\epsilon_{min} = \hbar/2mc$, limited only by the uncertainty principle. Due to adiabatic invariance, the particle can be accelerated along the focusing channel in its ground state without any radiation energy loss. These findings may apply to bent systems provided that the focusing field dominates over the bending field.

8327 (SLAC-PUB–6566) **PEP-II vacuum system - joining SS flanges to copper beam chambers.** Fetzko, S.; Hoyt, E.; Cummings, U. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jun 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-940618–114: 4. European particle accelerator conference, London (United Kingdom), 27 Jun - 1 jul 1994). Order Number DE95006093. Source: OSTI; NTIS; INIS; GPO Dep.

Various methods of joining stainless steel flanges to the copper PEP-II high-energy ring vacuum chambers was investigated with regard to metallurgical soundness, reliability, complexity, and cost. The most promising method appears to be direct electron-beam welding.

8328 (SLAC-PUB–6617) **High gradient tests of SLAC Linear Collider Accelerator Structures.** Wang, J.W. (and others); Deruyter, H.; Eichner, J.; Fant, K.H.; Hoag, H.A.; Koontz, R.F.; Lavine, T.; Loew, G.A.; Loewen, R.; Menegat, L. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Aug 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9408125–47: 17. international LINAC conference, Tsukuba (Japan), 21-26 Aug 1994). Order Number DE95006053. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the current SLAC R&D program to develop room temperature accelerator structures for the Next Linear Collider (NLC). The structures are designed to operate at 11.4 GHz at an accelerating gradient in the range of 50 to 100 MV/m. In the past year a 26 cm constant-impedance traveling-wave section, a 75 cm constant-impedance traveling-wave section, and a 1.8 m traveling-wave section with detuned deflecting modes have been high-power tested. The paper presents a brief description of the RF test setup, the design and manufacturing details of the structures, and a discussion of test results including field emission, RF processing, dark current spectrum and RF breakdown.

8329 (SLAC-PUB–6694) **Polarization at SLAC.** Woods, M. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9409103–13: International symposia on high energy spin physics and polarization phenomena in nuclear physics, Bloomington, IN (United States), 15-22 Sep 1994). Order Number DE95006214. Source: OSTI; NTIS; INIS; GPO Dep.

A highly polarized electron beam is a key feature. for the Current physics program at SLAC. An electron beam polarization of 80% can now be routinely achieved for typically 5000 hours of machine operation per year. Two main Physics programs utilize the polarized beam. Fixed target experiments in End Station A study the collision of polarized electrons with polarized nuclear targets to elucidate the spin structure of the nucleon and to provide an important test of QCD. Using the SLAC Linear Collider, collisions of polarized electrons with unpolarized positrons allow precise measurements of parity violation in the Z-fermion couplings and provide a very precise measurement of tile weak mixing angle. This paper discusses polarized beam operation at SLAC, and gives an overview of the polarized physics program.

8330 (SLAC-PUB–6702) **Review of the SLAC and Les Houches workshops.** Prescott, C.Y. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Dec 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-9409103–10: International symposia on high energy spin physics and polarization phenomena in nuclear physics, Bloomington, IN (United States), 15-22 Sep 1994). Order Number DE95006069. Source: OSTI; NTIS; INIS; GPO Dep.

Polarized Electron Source workshops have been held at varying intervals, beginning in 1983 when Charles Sinclair convened the first at SLAC. Since that time, three workshops were held in conjunction with the International Spin Symposia and two at other occasions. The increasing importance of polarized electron beams at accelerators has stimulated interest in these workshops. Two workshops have been held since the last International Spin Symposium in Nagoya. In 1993, a workshop was held at SLAC, and in 1994 at Les Houches, a polarized electron beam session was held as part of a polarized beam and targets workshop. This report summarizes highlights from the latter two workshops.

8331 (UM-P–94/92) **The use of a CCD imaging system for X-ray film intensity measurement.** Grigg, M.W.; Barnea, Z. Melbourne Univ., Parkville, VIC (Australia). School of Physics. [1994]. 12p. Sponsored by Australian Research Council, Canberra, ACT (Australia). Order Number DE95615825. Source: OSTI; NTIS (US Sales Only); INIS.

The use of a simple CCD-based imaging system for digitizing and x-ray film image is demonstrated. A method of extending the region of linear response of the film based upon an analytic representation of the observed response to a series of increasing exposures is described. The validity of the procedure is illustrated through an example of the absolute intensity measurement of a reflection of cadmium sulphide. 3 refs., 7 figs.

Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941001–9: 41. annual American Vacuum Society symposium, Denver, CO (United States), 24-28 Oct 1994). Order Number DE95004656. Source: OSTI; NTIS; INIS; GPO Dep.

TZM (a high temperature molybdenum alloy), machinable tungsten, and 304 stainless steel were cleaned using environmentally safe, commercially available cleaning detergents. The surface cleanliness was evaluated by x-ray photoelectron spectroscopy (XPS). It was found that a simple alkaline detergent is very effective at removal of organic and inorganic surface contaminants or foreign particle residue from machining processes. The detergent can be used with ultrasonic agitation at 140 F to clean the TZM molybdenum, machinable tungsten, and 304 stainless steel. A citric-acid-based detergent was also found to be effective at cleaning metal oxides, such as iron oxide, molybdenum oxide, as well as tungsten oxides at mild temperatures with ultrasonic agitation, and it can be used to replace strong inorganic acids to improve cleaning safety and minimize waste disposal and other environmental problems. The efficiency of removing the metal oxides depends on both cleaning temperature and time.

8333 (BNL–61082) **Photon stimulated desorption (PSD) measurements of extruded copper and of welded copper beam chambers for the PEP II asymmetric B-factory.** Foerster, C.L. (Brookhaven National Lab., Upton, NY (United States). NSLS); Lanni, C.; Perkins, C.; Calderon, M.; Barletta, W. Brookhaven National Lab., Upton, NY (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-941001–10: 41. annual American Vacuum

Society symposium, Denver, CO (United States), 24-28 Oct 1994). Order Number DE95004842. Source: OSTI; NTIS; INIS; GPO Dep.

PEP II is being built as a higher luminosity electron-positron collider, with asymmetric beams of 9 GeV and 3.1 GeV, having maximum currents of 3.0 A. Based on the previous work on the NSLS VUV beamline U10B, a copper was selected for construction of UHV beam chambers and absorbers to minimize the pressure rise from synchrotron radiation during operation. An extruded beam chamber and a welded beam chamber were fabricated from the selected copper for PSD measurements on NSLS X-ray beamline X28A. The chambers were exposed to white light with a critical energy of 5 KeV, both direct and through a 0.010 inch thick Beryllium filter. Each chamber was exposed to a dose of approximately 10^{23} photons per meter at an incidence angle of 25 mrad, after argon glow conditioning and a 150 C vacuum bake. Desorption yields for H_2 CO, CO_2, and CH_4 are reported as a function of accumulated photon flux, critical energy, and chamber preparation. The results are compared with the previous work on beamline U10B and with those of other published work for copper.

(CONF-9209485–: Course on general accelerator physics, Jyvaeskylae (Finland), 7-18 Sep 1992). In *CAS CERN accelerator school: 5. general accelerator physics course. Vol. 2. Proceedings.* Order Number DE95608324. Source: OSTI; NTIS (US Sales Only); INIS.

In this paper the basic terms used by the vacuum engineer are presented and some useful formulae are also given. The concept of bakeout is introduced and the physics behind it explained. We concentrate on the effects in electron and proton storage rings which are due to energetic particle bombardment of the vacuum system walls and the ensuing gas desorption which may detrimentally affect the running of the machine. In addition, the problems associated with proton storage rings where the vacuum chamber is at cryogenic temperature are described.

The Advanced Light Source (ALS) produces the world's brightest light in the ultraviolet and soft x-ray regions of the spectrum. The first low-energy third-generation synchrotron source in the world, the ALS provides unprecedented opportunities for research in science and technology not possible anywhere else. This year marked the beginning of operations and the start of the user research program at the ALS, which has already produced numerous high quality results. A national user facility located at Lawrence Berkeley Laboratory of the University of California, the ALS is available to researchers from academia, industry, and government laboratories. This report contains the following: (1) director's message; (2) operations overview; (3) user program; (4) users' executive committee; (5) industrial outreach; (6) accelerator operations; (7) beamline control system; (8) insertion devices; (9) experimental systems; (10) beamline engineering; (11) first results from user beamlines; (12) beamlines for 1994–1995; (13) special events; (14) publications; (15) advisory panels; and (16) ALS staff.

44 INSTRUMENTATION

8336 (KAERI/RR–1340/93) **The establishment of master plan for developing advanced I and C technology -The development of advanced instrumentation and control technology-.** Ham, Chang Shik (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Lee, Byung Sun; Kwon, Kee Choon; Lee, Dong Young; Hwang, In Koo; Lee, Jang Soo; Kim, Jung Soo; Kim, Chang Hwoi; Jung, Chul Hwan; Na, Nan Ju; Dong, In Sook; Kang, Soon Gu; Lyu, CKorea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 392p. (In Korean). Order Number DE95612956. Source: OSTI; NTIS; INIS.

Although several organizations are performing their tasks making efforts to develop new digital technology for application to existing nuclear power plants as well as new plants of the future, their projects are similar to each other and have possibilities of redundant investment. Therefore, KAERI have established a Master Plan to define the suitable work-scope of each Instrumentation and Control (I and C) development project and proceed its development items continuously. Furthermore, in the project, several kinds of advanced technology for application of computer science and digital electronics were studied to obtain better reliability of the I and C systems and reduce opertor's burden. For establishing the Master Plan, functions of I and C system of NPPs were surveyed. Especially EPRI URD was deeply analyzed for setting up a basis of the foreign countries were referred for the Master Plan. For the new technology survey, fault-tolerant control technology and control system performance analysis methods were studied. Requirements of alarm and information system as well as technology of I and C network system of NPPs were also established to introduce the advantages of commercial distributed control system. (Author).

8337 (KAERI/RR–1341/93) **The construction of environments for development of test and verification technology -The development of advanced instrumentation and control technology-.** Kwon, Kee Choon (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Ham, Chang Shick; Lee, Byung Sun; Kim, Jung Taek; Park, Won Man; Park, Jae Chang; Kim, Jae Hee; Lee, Chang Soo. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Jul 1994. 322p. (In Korean). Order Number DE95612957. Source: OSTI; NTIS; INIS.

Several problems were identified in digitalizing the I and C systems of NPPs. A scheme is divided into hardware and software to resolve these problems. Hardware verification and validation analyzed about common mode failure, commercial grade dedication process, electromagnetic competibility. We have reviewed codes and standards to be a consensus criteria among vendor, licenser. Then we have described the software licensing procedures under 10 CFR 50 and 10 CFR 52 in the United States Nuclear Regulatory Commision (NRC) and presented vendor's approaches to scope with the licensing barrier. At last, we have surveyed the technical issues related to developing and licensing the high integrity software for digital I and C systems. (Author).

The basis for several design features of The STAR Electromagnetic Calorimeter and Shower Maximum Detector is presented. This includes some of the tile-fiber optical design. The authors describe both the barrel and the end cap. Some preliminary analysis of electron acceptance vs pion rejection in test beam data is also discussed.

8340 (ANL-HEP-TR-94-42) **Thermal effects on the STAR electromagnetic calorimeter.** Fornek, T. (Argonne National Lab., IL (United States). High Energy Physics Div.); Guarino, V.; Spinka, H.; Underwood, D. Argonne National Lab., IL (United States). 19 Jul 1994. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004663. Source: OSTI; NTIS; INIS; GPO Dep.

The STAR detector for the RHIC colliding beam accelerator is under construction at Brookhaven National Laboratory. This detector will consist of a number of subsystems. These include a silicon vertex detector (SVT) for charged particle tracks near the interaction region, a time projection chamber (TPC) for charged particle tracking, an array of plastic scintillation counters (CTB) in a layer around the TPC for triggering on charged particles, a conventional solenoidal magnet, and some additional small triggering detectors along the beam-line. An electromagnetic calorimeter (EMC) is an upgrade to the "baseline" detector configuration above. The conventional magnet and numerous electronic channels for the SVT and TPC subsystems will generate a considerable amount of heat during the operation of STAR. However, it is possible that a chiller for the magnet cooling water will not be available during some of the early STAR runs. As a result, the average magnet temperature may vary considerably between winter and summer. This note summarizes calculations and measurements performed to evaluate the effects of an elevated magnet temperature on the performance of the electromagnetic calorimeter.

8341 (ANL-HEP-TR-94-87) **Support girder design for the atlas hadron calorimeter.** Hill, N.F.; Guarino, V.J.; Petereit, E. Argonne National Lab., IL (United States). 16 Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95004638. Source: OSTI; NTIS; INIS; GPO Dep.

The girder is the primary structural element of the Hadron Calorimeter. It provides the backbone of the Tile-Cal module and the basic construction reference for the assembly of the module. The girder also forms the outer radius support ring, when the individual modules are assembled into the barrel and the extended barrel assemblies. The girder also serves as the primary flux return path for the solenoidal coil, and as a magnetic shield around the photomultiplier tubes and the electronics to prevent their being affected by stray fields created by the muon toroid. It should be noted that the amount of steel in the girder is dominated by the flux return requirement, and not by the structural requirement. The orientation of the individual components of the girder are demanded by the need to contain the PMT and electronics drawer which resides inside the box structure.

8342 (CNIC–00777) **The calibration facilities of gamma-ray spectrometer oil logging system.** Zhao Yunlong (Beijing Research Inst. of Uranium Geology (China)); Liu Yuzhang; Duan Wenxian. China Nuclear Information Centre, Beijing, BJ (China). Aug 1993. 15p. (In Chinese). (BRIUG–0013.). Order Number DE95613002. Source: OSTI; NTIS (US Sales Only); INIS.

The construction technology for the calibration facilities of gamma-ray spectrometer oil logging system is introduced. It is referenced to the experience from similar calibration facilities at home and abroad. Facilities consist of 9 models. The effective diameter of each model is 1.5 m and the height is 6 m. Each borehole has U ore zone, Th ore zone, K ore zone, high mixed zone, high mixed thin zone, low mixed zone and barren zone. There are 45 zones in total. Each element model has 6 in, 8.5 in and 12 in of different diameters. The preventing radon migration and complete sealing technology are used for each zone to prevent radon from escaping. The density of models, homogeneity and moisture of radio elements have been measured that gives a complete data for calibration adjusting of the instrument. The sizes of facilities and the concentration of radioactivity are reasonable designed and conformed to the recommendation of IAEA. Parameters are consistent with the parameters of calibration facilities built by Houston University in America. The emanation coefficient of the facilities is lees than 1%. The dry density of filling is 2.12 g/cm^3 and the relative standard deviation is +- 1.9%.

8343 (CNIC–00786) **Study on the large position sensitive detector.** Wan Yude (Academia Sinica, Beijing, BJ (China). Inst. of Atomic Energy); Li Zhongzhen. China Nuclear Information Centre, Beijing, BJ (China). Oct 1993. 8p. (In Chinese). (IAE–0125.). Order Number DE95613069. Source: OSTI; NTIS (US Sales Only); INIS.

A large position sensitive detector, in which the charge division technique is used, with a single wire anode proportional counter is developed. The sensitive area of the detector is 1200 x 60 mm^2. The anode of the detector is NiCr wire with 10 μm in diameter and 12 Ω/mm of its resistance. The cathodes of the detector are single side aluminized Mylar films and the thickness 12.5 μm. The detector works under the condition of flushing the mixed gas of 70% Ar + 30% CH_4 with one atmosphere. In order to test the detector a ^{241}Am alpha source (about 5 MeV) is put on the collimator. The collimator can freely and accurately move along the detector window. Along the direction of anode wire, measurement is performed in the distance of every 6 cm. The total is 19 measuring points. The average intrinsic position resolution (FWHM) is about 0.6 mm, and the integral nonlinearity is better than 0.2%. This detector has been installed on the detector system of Q3D magnetic spectrometer and will be tested on the tandem accelerator with ion beam.

8344 (DOE/MC/29109–3977) **Road Transportable Analytical Laboratory (RTAL) system. Quarterly progress report, February 1994–April 1994.** Engineering Computer Opteconomics, Inc., Annapolis, MD (United States). 15 Dec 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29109. Order Number DE95006218. Source: OSTI; NTIS; INIS; GPO Dep.

Progress on Phase 2 development of the RTAL system during the period February 1 through April 30, 1994 is reported.

8345 (DOE/MC/29109–3978) **Road Transportable Analytical Laboratory (RTAL) system. Quarterly progress report, May 1994–July 1994.** Engineering Computer Opteconomics, Inc., Annapolis, MD (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29109. Order Number DE95006217. Source: OSTI; NTIS; INIS; GPO Dep.

Progress achieved on the development of the RTAL system during the quarter, May 1 through July 31, 1994 is reported. The work included NEPA analysis, drawings, prototype system construction, and on-site prototype demonstration.

8346 (FEI–2293) **Choice of cold moderator for the DIN-2PI spectrometer.** Novikov, A.G.; Rogov, A.D. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1992. 28p. (In Russian). Order Number DE95613003. Source: OSTI; NTIS (US Sales Only); INIS.

The main problems concerning the choice of a cold moderator for the DIN-1PU neutron spectrometer in the neutron beam No.2 of the IBR-2 reactor are considered. It is concluded, that the cold water grooved moderator is the most suitable one under neutron beam No.2 and spectrometer DIN-2PI conditions. 35 refs.; 12 figs.; 1 tab.

8347 (FNAL/C–94/307) **Low-pressure micro-strip gas chamber and a search for a high-efficiency secondary-electron emitter.** Anderson, D.F. (Fermi National Accelerator Lab., Batavia, IL (United States). Particle Detector Group); Kwan, S.; Sbarra, C. Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-941060–1: 4. international conference on advanced technology and particle physics, Como (Italy), 3-7 Oct 1994). Order Number DE95004854. Source: OSTI; NTIS; INIS; GPO Dep.

The test beam performance of a low-pressure micro-strip gas chamber with a thick CsI secondary-electron emitting surface as the source of primary ionization is presented. A study of the secondary-electron yield of CsI and KCl coated surfaces are discussed, as well as a promising new technique, CsI-treated CVD diamond films.

Fermi National Accelerator Lab., Batavia, IL (United States). Nov 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH03000. (CONF-9407142–8: ICHEP '94, Glasgow (United Kingdom), 20-27

Jul 1994). Order Number DE95004848. Source: OSTI; NTIS; INIS; GPO Dep.

The D0 detector at Fermilab is being upgraded to meet the demands imposed by high luminosity Tevatron running planned to begin in 1998. The central tracking detectors will be replaced with silicon and scintillating fiber tracking systems inside a solenoidal magnetic field and a preshower detector will be added to aid in electron identification. The design and performance of these systems are described and detailed simulations of the physics capabilities of the upgraded detector are presented. In particular the authors focus on the study of electroweak boson properties and top quark physics and briefly describe the b-physics capabilities.

8349 (GANIL-T–94-01) **1-D and 2-D processing for on-line control and data analysis assistance for the multidetector 4π INDRA.** Benkirane, A. Grand Accelerateur National d'Ions Lourds (GANIL), 14 - Caen (France). Feb 1994. 176p. (In French). Order Number DE95613070. Source: OSTI; NTIS (US Sales Only); INIS.

The first part of the thesis is concerned with the quality control of the detection modules and three analysis methods are studied and compared: spectral analysis, distribution function method and correlation form measurement; implementation of the spectral analysis technique is then described. The second part is concerned with the non controlled identification of the Z lines; an image processing approach is adopted which handles the peak line recognition problem as an edge detection problem. A contextual edge detection system with a-priori knowledge is presented. Examples of implementation and integration are given. 44 figs., 59 refs.

8363 (IA–1486, pp. 139-141) **A square 7.5 inch proportional guard detector.** Levinson, S.; Assido, H.; Shemesh, Y.; Piestun, S.; German, U. Israel Atomic Energy Commission, Tel Aviv (Israel). Licensing Div. Aug 1994. In *Research laboratories annual report 1993.* 206p. Order Number DE95614584. Source: OSTI; NTIS (US Sales Only); INIS.

A new version of a square 7.5 inch proportional guard detector was developed. The main difference between the 'old' version, used in a microprocessor-based counting system, and the 'new' one is in the anode wiring, which leads to better performance and easier manufacturing and assembly. Both detector versions are built of PVC coated on the inside with an electricity-conducting spray. The anode consists of nine stainless steel spiral wires of 0.002 inch diameter. The counting gas in both detectors is 90% argon and 10% methane. (authors). 1 ref., 3 figs.

Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to NIM.

A prototype of the fronted electronics for tracking detectors with high channel density is described. A method of channel number compression is used in this apparatus and the number of transmission lines between detectors and fronted electronics is decreased by 8 times. A descriptions of the electronic modules and experimental results are presented. 6 refs.; 8 figs.

Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to the journal 'Pribory i Tekhnika Ehksperimenta'.

The paper describes an efficient fast-response pulse hybrid discriminators developed for microstrip silicon detectors and presents the results of an investigation into basic characteristics of the discriminator. Actuation threshhold dependences on shift voltage, power supply voltage and forming capacity value are given. Actuation time dependences on input signal amplitude are presented. Intrinsic input resistance of the discriminator is 1.2 kOhm, output characteristic transconductance - 0.72 V/mV, output signal front for 0.1-0.9 levels is 2.5 ns. The discriminators's power consumption 6 V x 4 mA. 8 refs., 8 figs.

8369 (IFVE-OEIUNK–92-60) **Cable connection between the detector and low-noise amplifier as an alternative of the radiation-resistant amplifiers.** Krasnokutskij, R.N.; Sushkov, V.V.; Fedyakin, N.N.; Chen, M.; Tsang, Kh.; Shuvalov, R.S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian Federation). Inst. Fiziki Vysokikh Ehnergij. 1992. 19p. (In Russian). Order Number DE95613151. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents the results of a thorough analysis of noises in case of cable connection between the detector and amplifier. Equivalent noise charge is calculated for different cable lengths, detector capacitance and pulse length. It is ascertained that in case of higher detector capacitances $C \geq 100$ pΦ equivalent noise charge decreases and later on stops depending on cable length. Transistors with threshold frequency of the order of several GHz shall be used to obtain a good signal/noise ratio. 2 refs., 11 figs., 2 tabs.

8370 (IHEP–93-117) **Beam tests of 'Spacal' type modules for a high pressure gas calorimeter.** Konstantinov, V.F. (and others); Krasnokutskij, R.N.; Shuvalov, R.S. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Serpukhov (Russian

Federation). Inst. Fiziki Vysokikh Ehnergij. 1993. 19p. Order Number DE95613073. Source: OSTI; NTIS (US Sales Only); INIS.

High-pressure gas modules with cylindrical ionization chambers for a Very Forward Calorimeter (VFC) are constructed and tested in the IHEP U-70 electron beam. The module performance at small angles is tested in the energy range of 10-30 GeV using different gas mixtures like $Ar+CH_4$, $Ar+CF_4$ and pure CF_4 at the pressure of 20-40 atm. The best value of energy resolution reached is 18% at the angle 5.7 deg for 30 GeV electrons. The design is found to be adequate for future use in ATLAS/LHC. 24 refs.; 10 figs.

Investigation of time characteristics of Metal-Resistive layer Semiconductor structure based on silicon avalanche detectors with negative feedback, proposed for time-of-flight, is described. Time resolutions of 550 ps on β-electrons and 250 ps on LED light pulses were obtained. Design and principles of operation are described briefly. (author). 5 refs.; 4 figs.

8377 (JINR-E–13-94-214) **Experimental Study of Particle Separation in a L Kr Ionization Chamber by Multiple Measuring of dE/d x Using the Shape Analysis of Signal.** Cantoni, P. (Istituto Nazionale di Fisica Nucleare, Bologna (Italy)); Frabetti, P.L.; Stagni, L. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. 14p. Order Number DE95613074. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Instruments and Methods.

Charged particle (π - k) separation in the momentum range 0.5 - 0.7 GeV/c using a new method of shape analysis of the signal from a liquid krypton (L Kr) ionization chamber has been experimentally studied. The detector has been exposed to pions and protons at T11 test beam at the CERN PS. The shape of the preamplifier output signal was recorded by a waveform digitizer, then it was doubly 'differentiated' to obtain few measurements of dE/d x inside a 2 cm gap. This permits an increase of the boundary momentum of 2 σ separation from 0.6 GeV/c to 0.68 GeV/c. The comparison with the Monte Carlo result shows good agreement. (author). 11 refs.; 9 figs.

8378 (JINR-E–13-94-247) **Investigation of Silicon Planar Detectors for LHC project.** Cheremukhin, A. (Joint Inst. for Nuclear Research, Dubna (Russian Federation)); Golutvin, I.; Rashevskij, A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 18p. Order Number DE95613075. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Instruments and Methods.

Planar detectors developed by ELMA, Zelenograd, Russia, For high energy physics application have been investigated. Detectors with dimensions 20-20-0.4 mm^3 have been manufactured of high resistivity (2-6 k Ohm · cm) n-type float-zone silicon (FZ-Si). Parameters of deep levels in the forbidden gap, defect types and concentration, donor and acceptor impurity concentration have been determined for two samples of starting float zone crystals manufactured by two different producers: FZ-Si from WACKER CHEMITRONICS and Zaporozh'e Titanium-Magnesium Factory (ZTMF, Zaporozh'e, UK).The research includes the measurements of current-voltage characteristics, capacitance-voltage characteristics, charge collection efficiency and signal kinetics for the detector experimental set. The results have shown that the detector parameters are acceptable for their application in high energy physics as well as in the field of traditional spectroscopy. (author). 11 refs.; 13 figs.; 2 tabs.

8379 (JINR-E–13-94-283) **New Development of a Small-Angle Neutron Scattering Instrument for a Pulsed Neutron Source.** Nikitenko, Yu.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1994. 6p. Order Number DE95613004. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to ICNS'94, Senai, JP.

A new way of increasing the luminosity of the pinhole geometry SANS spectrometer is proposed for a pulsed neutron source. The method consists in changing the pinhole cross-sections area according to a certain dependence on time. As the result, the luminosity increases several times at a fixed distortion of the scattering law. (author). 10 refs.; 2 figs.

8380 (JINR-E–13-94-284) **A Wide Spectrum Neutron Polarizer for a Pulsed Neutron Source.** Nikitenko, Yu.V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Neutron Physics. 1994. 4p. Order Number DE95613005. Source: OSTI; NTIS (US Sales Only); INIS.

Submitte to ICNS'94, Sendai, JP.

A wide spectrum neutron polarizer for a pulsed neutron source is considered. The polarizer is made in a form of a set of magnetized mirrors placed on a drum. Homogeneous rotation of the polarizer is synchronized with the power pulses of the neutron source. The polarizer may be utilized in a collimated neutron beam with cross section of the order of magnitude of 100 cm^2 within a wavelength from 2 up to 20 A on sources with a pulse repetition frequency up to 50 Hz. (author). 5 refs.; 3 figs.

Submitted to Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya.

The method of measurements of endpoint energies of positron spectra by using Ge(Hp)-detector is described. The method has been applied to measure the decay energies of 25 isotopes of rare earths elements. Taking into account effects of the positron back and side scattering, Bremsstrahlung and energy summing of positron and AR (annihilation radiation) pulses allowed to decrease the systematic error of positron endpoint energy determinations up to 30 keV. That is, as a rule, enough for comparisons with mass formulae and for analyzing nuclear decay properties. (author). 7 refs., 5 figs., 1 tab.

8383 (JINR-R–13-94-267) **Equipment for Measurement ICE and eγ-Coincidence Spectra.** Sehrehehtehr, Zh.; Yuldashev, M.B.; Gorozhankin, V.M.; Gromov, K.Ya.; Kalinnikov, V.G.; Kuznetsov, V.V.; Osipenko, B.P.; Fominykh, V.I. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. 6p. (In Russian). Order Number DE95613007. Source: OSTI; NTIS (US Sales Only); INIS.

The mini-orange magnetic spectrometer system for the measurement of conversion electron spectra and eγ-coincidences has been described. Mini-orange spectrometer efficiencies for two types of magnets are determined at distances 40 and 80 mm between the source and detector. The efficiency increase and the effect of elimination of the continuous background connected with the positron radiation have been demonstrated using the mini-orange on the example of ^{147} Tb($T_{1/2}$=1.7 h) conversion electron spectrum in the energy range 1-2 MeV. (author). 7 refs., 2 figs.

8384 (JINR-R–13-94-276) **The Calculation of the Main Characteristics of Ge(Li)-NaI(Tl) Anti-Compton Spectrometer by Monte Carlo Method.** Adam, J. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems); Blazek, K.; Maly, P.; Wagner, V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. 11p. (In Russian). Order Number DE95613008. Source: OSTI; NTIS (US Sales Only); INIS.

The experimental and calculated values of suppression factor of continuous Compton spectra measured by anti-Compton spectrometer (ACS) are presented. The calculations were made by means of Monte Carlo method taking into account photoelectric absorption of γ-rays, Compton scattering and pair production. The response function of ACS for ^{60} Co source was investigated. (author). 24 refs., 2 figs., 1 tab.

8385 (JINR-R–13-94-277) **Design (Ge-BGO+NaI(Tl)) of Anti-Compton Spectrometer.** Adam, J. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems); Blazek, K.; Maly, P.; Honusek, M. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. 22p. (In Russian). Order Number DE95613009. Source: OSTI; NTIS (US Sales Only); INIS.

The design of an asymmetric anti-Compton shield for BGO and NaI(Tl) crystals is described. Its dimensions have been optimized by means of Monte Carlo calculations over the range of incident gamma-ray energies between 0.2 MeV and 3.5 MeV. Monte Carlo method takes into account photoelectric absorption of γ-rays, Compton scattering and pair production. The suppression factor of the continuous ^{60} Co spectrum for the BGO and NaI(Tl) crystals of different dimensions is calculated for anti-Compton shield. (author). 25 refs., 9 figs., 2 tabs.

8386 (JINR-R–13-94-305) **Scintillator Based on SiO_2-Aerogel.** Bojko, I.R. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems); Ignatenko, M.A.; Esenak, K.; Kuhta, L.; Ruzicka, J.; Fainor, V. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1994. 15p. (In Russian). Order Number DE95613076. Source: OSTI; NTIS (US Sales Only); INIS.

Submitted to Nuclear Instruments and Methods.

By doping the SiO_2-aerogel with the wavelength shifter POPOP a scintillator with intermediate density between the gas and the solid state has been produced. The emission time and the light output of two samples with different concentration of the doping agent have been investigated. The light pulse shapes of the both samples are well approximated by a sum of two exponents with the decay times 1.4$\pm$0.1 ns (58% of total light output) and 5.2$\pm$0.4 ns (42%). Under irradiation of 5.5 MeV α-particles the light output of the sample with smaller wavelength shifter concentration was 30% and that of the sample with larger concentration was 8% of the light output of a plastic scintillator (polystyrene, 2% paraterphenil, 0.2% POPOP). Under irradiation of cosmic rays the light outputs of the samples exceeded the light output of the pure aerogel by 35% and 100% respectively. The obtained data point that the α/β ratio for both samples is close to 1. (author). 10 refs., 9 figs., 1 tab.

8387 (JINR-R–13-94-309) **Streamer Chamber Memory Time Measurement with an Auxiliary Spark Chamber.** Aksinenko, V.D. (Joint Inst. for Nuclear Research, Dubna (Russian Federation). Submitted to Pribory i Tekhnika Ehksperimenta.

Results of realization of a new method of measuring of the streamer chamber memory time are presented. The method is based on usage of an auxiliary spark chamber which is blown through with the gas of the streamer chamber. Accuracy of ten percent was achieved for usual operation memory time of a few microseconds. (author). 9 refs., 7 figs.

8388 (KAERI/RR–1257/93) **Applications of optical fiber to the remote fluorescence analysis.** Shin, Jang Soo (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Kim, Duck Hueon; Lee, Soo Ho. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1992. 94p. (In Korean). Order Number DE95613152. Source: OSTI; NTIS; INIS.

The laser fluorometer developed in 1987 has been used in real circumstances for trace uranium analysis. And, we have been trying to improve the instrument to be able to apply in analytical circumstances of remote measurement using optical fiber. The N_2 laser beam and the resulting fluorescence light could be successfully transmitted through a quartz-made optical fiber. The wavelength resolution and the fluorescence decay time resolution induced by pulsed N_2 laser were used to the uranium fluorescence analyses. The fluorescence of uranium in nitric acid medium was measured successfully using the system. The fluorescence signal was analysed using simplex method which is useful to deconvolute the mixed signals. An analytical method using thermal lens effect was developed. The method will be a complementary one for the fluorescence measurement. (Author).

8389 (KAERI/RR–1261/93) **Development of high energy radiation measurement system with diode.** Ji, Young Hoon (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Lee, Dong Han; Koh, Kyung Hwan; Cho, Chul Koo; Yoon, Hyong Keun; Lee, Seong Koo; Choi, Moon Sik. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 36p. (In Korean). Order Number DE95613153. Source: OSTI; NTIS; INIS.

The objectives of our experiment are as followed; 1. to develop the simply and rapidly measurable system for various parameters of emanated radiation by using the diode with low cost and easy availability, 2. to establish the basic technique for computerization of measurement system. The results are as followed; Detector, using 1N4007 silicon diode, was selected as the most superior probe, because the leakage current was 0.5pA, signal current 1.82nA, and the ratio of noise/signal was 0.03%. The measured results showed that linearity and stability of 1N4007 silicon diode detector were within 1.6%, sensitivity by radiation damage was decreased maximum 1% per 100Gy. Also, beam flatness and symmetry were within 2%. (Author).

8390 (KAERI/RR–1289/93) **Domestic production of control parts for the nuclear waste treatment facility.** Chung, Chong Eun (Korea Atomic Energy Res. Inst., Taejon (Korea, Republic of)); Han, Kwang Soo; Park, Kwang Hyeon; Hong, Suk Boong; Choi, Myung Jin; Kim, Seung Bok; Kim, Jung Bok. Korea Cancer Center Hospital, Seoul (Korea, Republic of). Dec 1993. 110p. (In Korean). Order Number DE95613011. Source: OSTI; NTIS; INIS.

The control part IND-100, which interfaces the field signals to the control networks in the control systems of PIEF (Post-Irradiated Examination Facility) and RWTF (Radioactive Waste Treatment Facility), was designed and fabricated. Preamplifier boards for radiation detectors, proportional counter and Geiger-Mueller tube which are in use in the radiation monitoring systems, were also designed and fabricated. Control parts which may be replaced with the domestic parts were surveyed, and a domestic relay model and a recorder model were selected as the replaceable ones. To improve the control systems, adoption of programmable controller to the conventional relay logic system were considered and analyzed. (Author).

Detailed design of the High Resolution Powder Diffractometer (HRPD) has been finished. As for essential components development, 1-D PSD counting system, driving of the mechanical components of spectrometers, and a chopper TOF spectrometer are in progress favourably. Study of crystal structure analysis on Uranium Silicides (U_3Si, U_3Si_2) and oxide superconductor ($YBa_2Cu_3O_{7-x}$) using the Rietveld refinement commened through the collaboration with foreign laboratories, and texture and analysis has been continued at the KRR-2 site. The Neutron Radiography Facility for the KMRR NR beam tube was designed by providing with 2 separate exposure cells for investigating the high radioactive components and general industrial purposes by real time inspection using neutron-TV and imaging processing technique. And development of neutron-TV and related imaging processing is in progress. Development of Si doping techniques by neutron transmutation method such as design of NTD irradiation tube, the fabrication of the electric control system and mechanical driving unit, study of NTD-Si irradiation damage, etc., are in progress. (Author).

8392 (LBL–36273) **$LuAlO_3$: A high density, high speed scintillator for gamma detection.** Moses, W.W. (Lawrence Berkeley Lab., CA (United States)); Derenzo, S.E.; Fyodorov, A.; Korzhik, M.; Gektin, A.; Minkov, B.; Aslanov, V. Lawrence Berkeley Lab., CA (United States). Nov 1994. 5p. Sponsored by USDOE, Washington, DC (United States);Department of Health and Human Services, Washington, DC (United States). DOE Contract AC03-76SF00098. Grants P01-HL25840, R01 CA48002, R01 NS29655. (CONF-9411173–2: IEEE nuclear science symposium, Norfolk, VA (United States), 1-5 Nov 1994). Order Number DE95004678. Source: OSTI; NTIS; INIS; GPO Dep.

We present measurements of the scintillation properties cerium doped lutetium aluminum perovskite, $LuAlO_3$:C, new dense (ρ=8.34 g/cm^3) inorganic scintillator. This material has a 511 keV interaction length and photoelectric fraction 1.1 cm and 32% respectively, which are well suited to gamma ray detection. In powdered form with 0.5% cerium concentration, the scintillation light output is estimated to be 9,600 photons/MeV of deposited energy, the emission spectrum is a single peak centered at 390 nm, and the fluorescence lifetime is described by the sum of 3 exponential terms, with 60% of the light being emitted with a 11 ns decay time, 26% with a 28 ns decay time, and 13% with a 835 ns decay time. Single crystals contaminated with =10% lutetium aluminum garnet ($Lu_3Al_5O_{12}$) have significantly altered scintillation properties. The light output is 26,000 photons/MeV (3.2 times that of BGO), but the decay time increases significantly (1% of the light is emitted with a 10 ns decay time, 15% with a 245 ns decay time, and 85% with a 2010 ns decay time) and the emission spectrum is dominated by a peak centered at 315 nm with a secondary peak centered at 500 rum. The short decay lifetime, high density, and reasonable light output of $LuAlO_3$:C (the perovskite phase) suggest that it is useful for applications where high counting rates, good stopping power, good energy resolution, and fast timing are important. However, it is necessary to grow single crystals that are uncontaminated by the garnet phase to realize these properties.

8393 (LBL–36287) **Charged particle detectors based on high quality amorphous silicon deposited with hydrogen or helium dilution of silane.** Hong, Wan-Shick (Lawrence Berkeley Lab., CA (United States)); Drewery, J.S.; Jing, Tao; Lee, Hyoung-Koo; Kaplan, S.N.; Perez-Mendez, V.; Mireshghi, Ali; Kitsuno, Yu. Lawrence Berkeley Lab., CA (United States). Nov 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. (CONF-941061–14: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95004671. Source: OSTI; NTIS; INIS; GPO Dep.

Electrical transport properties of the authors PECVD a-Si:H material has been improved by using hydrogen and/or helium dilution of silane and lower substrate temperature for deposition. For hydrogen-diluted material they have measured electron and hole mobilities $\sim$ 4 times larger, and $\mu\tau$ values 2-3 times higher than for their standard a-Si:H. The density of ionized dangling bonds (N_D^*) also showed a factor of 5-10 improvement. Due to its higher conductivity, the improved a- Si:H material is more suitable than conventional a-Si:H for TFT applications. However, it is difficult to make thick layers by H-dilution because of high internal stress. On the other hand, thick detectors can be made at a faster rate and lower stress by low temperature deposition with He-dilution and subsequent annealing. The internal stress, which causes substrate bending and delamination, was reduced by a factor of 4 to ~90 MPa, while the electronic quality was kept as good as that of the standard material. By this technique 35 μm-thick n-i-p diodes were made without significant substrate bending, and the electronic properties, such as electron mobility and ionized dangling bond density, were suitable for detecting minimum ionizing particles.

8394 (LUNFD6-NFFR–3064) **Nuclear reaction analysis - Development and application.** Sjoeland, K.A. Lund Univ. (Sweden). Dept. of Nuclear Physics. 6 Oct 1994. 10p. Order Number DE95613155. Source: OSTI; NTIS; INIS.

This thesis concerns itself with the development of Nuclear Reaction Analysis (NRA). A technique to reject pile-up pulses and defective tail pulses from surface barrier detectors by the use of pulse shape discrimination (PSD) is demonstrated. The characteristic tau value for pile-up rejection is shown to be less than 56 ns. Its effects on detection limits from tail reduction in Particle Elastic Scattering Analysis (PESA) and pile-up peak suppression is discussed. The impact of the PSD technique on various NRA methods is discussed. Boron Neutron Capture Therapy (BNCT) is a cancer therapy whose efficiency depends on the location on a subcellular level of boron. In the work presented in this thesis an attempt is made to develop a method to analyze boron in biological tissue with a detection limit at the ng/cm2 level and a lateral resolution of about 1 micrometer. Various nuclear reactions have been investigated in order to find one that can be used with a Nuclear Microprobe (NMP). 10B has been studied with the photon-tagged Nuclear Reaction Analysis (pNRA) in the backward and forward directions. 11B has been studied at the broad low energy resonance (Ep=0.66 MeV) that emits alpha particles. It is shown that it is possible to measure boron in biological tissue with the latter technique at the NMP. The problem to image the cell is also discussed. 3 refs.

8395 (PNL-SA–22048) **Intercomparison of high energy neutron personnel dosimeters.** McDonald, J.C. (Pacific Northwest Lab., Richland, WA (United States)); Akabani, G.; Loesch, R.M. Pacific Northwest Lab., Richland, WA (United States). Mar 1993. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9303220–4: Workshop on measurement quality assurance for ionizing radiation, Washington, DC (United States), 16-18 Mar 1993). Order Number DE95004563. Source: OSTI; NTIS; INIS; GPO Dep.

An intercomparison of high-energy neutron personnel dosimeters was performed to evaluate the uniformity of the response characteristics of typical neutron dosimeters presently in use at US Department of Energy (DOE) accelerator facilities. It was necessary to perform an intercomparison because there are no national or international standards for high-energy neutron dosimetry. The testing that is presently under way for the Department of Energy Laboratory Accreditation Program (DOELAP) is limited to the use of neutron sources that range in energy from about 1 keV to 2 MeV. Therefore, the high-energy neutron dosimeters presently in use at DOE accelerator facilities are not being tested effectively. This intercomparison employed neutrons produced by the $^{9}Be(p,n)^{9}B$ interaction at the University of Washington cyclotron, using 50-MeV protons. The resulting neutron energy spectrum extended to a maximum of approximately 50-MeV, with a mean energy of about 20-MeV. Intercomparison results for currently used dosimeters, including Nuclear Type A (NTA) film, thermoluminescent dosimeter (TLD)-albedo, and track-etch dosimeters (TEDs), indicated a wide variation in response to identical doses of high-energy neutrons. Results of this study will be discussed along with a description of plans for future work.

8396 (PNL-SA–24009) **Evaluation of new and conventional thermoluminescent phosphors for environmental monitoring using automated thermoluminescent dosimeter readers.** Rathbone, B.A.; Endres, A.W.; Antonio, E.J. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941017–6: 4. conference on radiation protection and dosimetry, Orlando, FL (United States), 24-27 Oct 1994). Order Number DE95004571. Source: OSTI; NTIS; INIS; GPO Dep.

In recent years, there has been considerable interest in a new generation of super-sensitive thermoluminescent (TL) phosphors for potential use in routine personnel and environmental monitoring. Two of these phosphors, α-Al_2O_3:C and LiF:Mg,Cu,P, are evaluated in this paper for selected characteristics relevant to environmental monitoring, along with two conventional phosphors widely used in environmental monitoring, LiF:Mg,Ti and CaF_2:Dy. The characteristics evaluated are light-induced fading, light-induced background, linearity and variability at low dose, and the minimum measurable dose. These characteristics were determined using an automated commercial dosimetry system (Harshaw System 8800) and routine processing protocols. Annealing and readout protocols for each phosphor were optimized for use in a large-scale environmental monitoring program.

8397 (PNL-SA–24010) **Site-specific calibration of the Hanford personnel neutron dosimeter.** Endres, A.W.; Brackenbush, L.W.; Baumgartner, W.V.; Rathbone, B.A. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941017–7: 4. conference on radiation protection and dosimetry, Orlando, FL (United States), 24-27 Oct 1994). Order Number DE95004570. Source: OSTI; NTIS; INIS; GPO Dep.

A new personnel dosimetry system, employing a standard Hanford thermoluminescent dosimeter (TLD) and a combination dosimeter with both CR-39 nuclear track and TLD-albedo elements, is being implemented at Hanford. Measurements were made in workplace environments in order to verify the accuracy of the system and establish site-specific factors to account for the differences in dosimeter response between the workplace and calibration laboratory. Neutron measurements were performed using sources at Hanford's Plutonium Finishing Plant under high-scatter conditions to calibrate the new neutron dosimeter design to site-specific neutron spectra. The dosimeter was also calibrated using bare and moderated ^{252}Cf sources under low-scatter conditions available in the Hanford Calibration Laboratory. Dose equivalent rates in the workplace were calculated from spectrometer measurements using tissue equivalent proportional counter (TEPC) and multisphere spectrometers. The accuracy of the spectrometers was verified by measurements on neutron sources with calibrations directly traceable to the National Institute of Standards and Technology (NIST).

8398 (PNL-SA–24144) **Survey speeds to detect one times and three times total contamination values from U.S. Department of Energy Radiological Control Manual, Table 2-2.** Johnson, M.L. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941017–5: 4. conference on radiation protection and dosimetry, Orlando, FL (United States), 24-27 Oct 1994). Order Number DE95004564. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents maximum scan speeds to maintain the minimum detectable activity (MDA) of Hanford contamination survey instruments at one times or three times the total contamination value. Scan speeds are interpolated from empirically derived minimum detectable count rates (MDCR) for beta/gamma and alpha contamination survey instruments. The MDCRs were measured using distributed contamination sources. The instruments tested were a 15.5-cm^2 pancake Geiger-Mueller (GM) detector, a 100-cm^2 gas proportional detector, and a 50-cm^2 Hanford portable alpha meter (PAM). The MDCR for a scanning survey is highly dependent on survey technique. Scanning surveys at Hanford are performed by scanning the surface with the probe held a maximum of 6 mm (1/4 in.) away from the surface. If an increase above background is noted, the technician pauses for 5 to 10 seconds. For this evaluation, any counts detected with an alpha survey instrument are treated as an increase above background (assumed to be 0 cpm). During the 5- to 10-second count, if additional counts are detected, the area is assumed to be contaminated. Methods for calculating the MDA were previously developed and reported in Goles et al. (1991). This report also provides MDAs for a 5-second static count with 67% and 95% probability of detection. The 5-second static count is conducted with the probe in contact with the surface being surveyed. The 67% detection probability is based on a Draft ANSI Standard N13.12 (ANSI 1978). The 95% detection probability is based on typical confidence levels used with fixed sample-counting instruments.

8399 (SLAC-PUB–6669) **BABAR - the detector for the PEP II B Factory at SLAC.** Lueth, V. BABAR Collaboration. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Sep 1994. 6p. Sponsored by USDOE, Washington, DC (United States).

DOE Contract AC03-76SF00515. (CONF-940816–72: Meeting of the Division of Particles and Fields of the American Physical Society, Albuquerque, NM (United States), 2-6 Aug 1994). Order Number DE95006065. Source: OSTI; NTIS; INIS; GPO Dep.

BABAR refers to the detector that is being designed for the PEP II B-Factory at SLAC to perform a comprehensive study of CP violation in B meson decays. The design requirements and the principal detector components are briefly described. A summary of the expected physics performance is presented.

8400 (SLAC-PUB–6701) **Test of an array of CsI(Tl) crystal towers for a low or medium energy e^+e^- collider calorimeter.** King, M.E. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Oct 1994. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00515. (CONF-930761–1: International Europhysics conference on high-energy physics, Marseille (France), 22-28 Jul 1993). Order Number DE95006068. Source: OSTI; NTIS; INIS; GPO Dep.

Energy and position resolution results of a test of an array of CsI(Tl) crystal towers in an e^-/π^- beam (120 to 400 MeV) at TRIUMF are presented. The array was designed to study the effects of longitudinal and transverse crystal segmentation on energy and position resolution, and background rejection. The author also studied a wavelength-shifter and multi-photodiode readout system suitable for use in an electromagnetic CsI calorimeter in a detector at low and medium energy, high-luminosity e^+e^- storage rings. Energy resolution of $(1.69 \pm 0.08)\%/\sqrt{E}$ and $(1.83 \pm 0.05)\%/\sqrt{E}$ were obtained for two different crystal tower configurations. Position resolution of 6.5 (9.0) mm was obtained at 300 (120) MeV for four 4 x 4 cm^2, 4 radiation length CsI crystals.

8401 (SLAC-PUB–6731) **Test of a conceptual prototype of the total internal reflection Cherenkov imaging detector (DIRC) with cosmic muons.** Aston, D. (Stanford Linear Accelerator Center, CA (United States)); Kawahara, H.; McShurley, D.; Muller, D.; Oxoby, G.; Hearty, C.; Kadyk, J.; Lynch, G.; Lu, A. Stanford Linear Accelerator Center, Menlo Park, CA (United States). Dec 1994. 6p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC03-76SF00515. (LBL–36536; CONF-941061–15: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95006072. Source: OSTI; NTIS; INIS; GPO Dep.

The DIRC is a totally internally reflecting Cherenkov imaging detector proposed for particle identification at the asymmetric e^+e^- B factories. First test results from a conceptual prototype using cosmic muons are reported. The photo-electron yield and the single Cherenkov photon resolution at various track dip angles and positions along the radiator bar have been measured. The results are consistent with estimates and Monte-Carlo simulations.

8409 (PNL-SA–24344) **CsI(Tl) with photodiodes for identifying subsurface radionuclide contamination.** Stromswold, D.C. (Pacific Northwest Lab., Richland, WA (United States)); Meisner, J.E.; Nicaise, W.F. Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830 ; AC06-87RL10930. (CONF-9411173–1: IEEE nuclear science symposium, Norfolk, VA (United States), 1-5 Nov 1994). Order Number DE95004558. Source: OSTI; NTIS; INIS; GPO Dep.

At the US Department of Energy's Hanford Site near Richland, Washington, underground radioactive contamination exists as the result of leaks, spills, and intentional disposal of waste products from plutonium-production operations. Characterizing these contaminants in preparation for environmental remediation is a major

effort now in progress. In this paper, a cylindrical (15 x 61 mm) CsI(Tl) scintillation detector with two side-mounted photodiodes has been developed to collect spectral gamma-ray data in subsurface contaminated formations at the U.S. Department of Energy's Hanford Site. It operates inside small-diameter, thick-wall steel pipes pushed into the ground to depths up to 20 m by a cone penetrometer. The detector provides a rugged, efficient, magnetic-field-insensitive means for identifying gamma-ray-emitting contaminants (mainly ^{137}Cs and ^{60}Co). Mounting two 3 x 30-mm photodiodes end-to-end on a flat area along the detector's side provides efficient light collection over the length of the detector.

8410 (WHC-SD-EN-TI–292) **Calibration of the radionuclide logging system germanium detector.** Randall, R.R. Westinghouse Hanford Co., Richland, WA (United States). 5 Dec 1994. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95004512. Source: OSTI; NTIS; INIS; GPO Dep.

High resolution passive gamma-ray logging, high resolution gamma-ray-emitting nuclides in areas surrounding underground waste disposal facilities on the US Department of Energy's Hanford Site. Gamma-ray source concentrations are derived from log data by calculations that employ the calibration factors and correction functions described in this report. Calibration data were collected with a Radionuclide Logging System. Analyses of the calibration data established: (1) calibration factors for potassium, uranium, and thorium, and (2) a calibration function that permits assessments of cesium-137, cobalt-60, and other artificial nuclides not represented in the calibration models.

4405 Thermal Instrumentation

8411 High temperature probe. Swan, R.A. To Dept. of Energy. 1992. Filed date 4 Nov 1992. U.S. Patent Application 7-971,111. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006109. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A high temperature probe is claimed for sampling, for example, smokestack fumes, and is able to withstand temperatures of 3000°F. The probe is constructed so as to prevent leakage via the seal by placing the seal inside the water jacket whereby the seal is not exposed to high temperature, which destroys the seal. The sample inlet of the probe is also provided with cooling fins about the area of the seal to provide additional cooling to prevent the seal from being destroyed. Also, a heated jacket is provided for maintaining the temperature of the gas being tested as it passes through the probe. The probe includes pressure sensing means for determining the flow velocity of an efficient being sampled. In addition, thermocouples are located in various places on the probe to monitor the temperature of the gas passing there through.

8412 Method and apparatus for optical temperature measurement. O'Rourke, P.E.; Livingston, R.R.; Prather, W.S. To Dept. of Energy. 1992. Filed date 20 Nov 1992. U.S. Patent Application 7-979,672. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. Order Number DE95006105. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A temperature probe and a method are claimed for using said probe for temperature measurements based on changes in light absorption by the probe. The probe comprises a first and a second optical fiber that carry light to and from the probe, and a temperature sensor material, the absorbance of which changes with temperature, through which the light is directed. Light is directed through the first optical fiber, passes through the temperature sensor material, and is transmitted by a second optical fiber from the material to a detector. Temperature-dependent and temperature-independent factors are derived from measurements of the transmitted light intensity. For each sensor material, the temperature T is a function of the ratio, R, of these factors. The temperature function f(R) is found by applying standard data analysis techniques to plots of T versus R at a series of known temperatures. For a sensor having a known temperature function f(r) and known characteristic and temperature-dependent factors, the temperature can be computed from a measurement of R. Suitable sensor materials include neodymium-doped borosilicate glass, accurate to ±0.5°C over an operating temperature range of about −196°C to 400°C; and a mixture of D_2O and H_2O, accurate to ±0.1°C over an operating range of about 5°C to 90°C.

4406 Optical Instrumentation

Refer also to citation(s) 7324, 7697, 7956, 8271, 8275

8413 Broadband radiometer. Cannon, T.W. 1992. Filed date 28 Oct 1992. U.S. Patent Application 7-967,481. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95006136. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a broadband radiometer including (a) an optical integrating sphere having a generally spherical integrating chamber and an entry port for receiving light,(e.g., having visible and ultraviolet fractions), (b) a first optical radiation detector for receiving light from the sphere and producing an electrical output signal corresponding to broadband radiation, (c) d second optical radiation detector for receiving light from the sphere and producing an electrical output signal corresponding to a predetermined wavelength fraction of the broadband radiation, and (d) an output for producing an electrical- signal which is proportional to the difference between the two electrical output signals. The radiometer is very, for example, in measuring the absolute amount of ultraviolet light present in a given light sample.

8414 Lensing duct. Beach, R.J.; Benett, W.J. 1992. Filed date 30 Nov 1992. U.S. Patent Application 7-983,350. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95006120. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is comprised of a lensing duct to condense (intensify) light using a combination of front surface lensing and reflective waveguiding. The duct tapers down from a wide input side to a narrow output side, with the input side being lens-shaped and coated with an antireflective coating for more efficient transmission into the duct. The four side surfaces are uncoated, preventing light from escaping by total internal reflection as it travels along the duct (reflective waveguiding). The duct has various applications for intensifying light, such as in the coupling of diode array pump light to solid state lasing materials, and can be fabricated from inexpensive glass and plastic.

8415 (BNL–61272) **The development of a positron ionization gauge.** Jacobsen, F. (Brookhaven National Lab., Upton, NY (United States). Dept. of Physics); Strongin, M.; Ruckman, M.; Wiess, A.; Turner, W.C. Brookhaven National Lab., Upton, NY (United States); Superconducting Super Collider Lab., Dallas, TX (United States). Jan 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016 ; AC35-89ER40486. (SSCL-N–846). Order Number DE95005958. Source: OSTI; NTIS; INIS; GPO Dep.

The authors present a method by which gas pressure (density) can be measured by positrons. The process to monitor is the formation of positronium, Ps, via electron capture by the e^+ from the rest gas molecules. The Ps signal which is proportional to the gas density is obtained from the annihilation photons which are emitted when the Ps atom decays. By this method it is not necessary to have access to the vacuum system in question other than having the possibility of passing a positron beam through it. Also the present method is fully UHV compatible. In its simplest version pressures below 10^{-8} torr (at room temperature) can be measured within a reasonable time. Techniques are discussed which will significantly improve the sensitivity of the present ionization gauge. The specific reason for designing and using the positron ionization gauge is to be able to measure the pressure inside the Superconducting Super Collider beam tubing during simulated operation.

8416 (DOE/MC/29119–3881) **Innovative directional and position specific sampling technique. Phase 3: Final report, July 1992–September 1994.** Hutzel, W.J.; Hill, J.L. III; Foster, E.L.

UTD, Inc., Newington, VA (United States). Sep 1994. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29119. Order Number DE95000006. Source: OSTI; NTIS; INIS; GPO Dep.

The POLO System is a major enhancement to the state of the art for subsurface environmental restoration equipment. The system locate s the tip position of penetrometer probes as they are placed underground while meeting the rigid constraints of environmental restoration applications. POLO is applicable to small diameter probes, does not obstruct the center of the probe, is rugged, is unaffected by the presence of steel or other magnetic material, and is capable of remote operation beneath underground tanks or foundations. The development and adaptation of the POLO System for use with penetrometers has progressed through three development phases prior to commercialization. Phases I and II of the contract included the design, testing, and integration of all components of the POLO device. Efforts were made to simulate field conditions in terms of the scale of the components as well as the operating environment. The preestablished success criterion, which has been maintained throughout the research, was to demonstrate path tracking with a total error of less than 0.50% of the distance traveled for distances less than 70 meters. The results tests on individual POLO components showed that the equipment met or exceeded the success criterion. Phase II laboratory scale path tracking experiments also met the success criterion. Phase III moved the POLO System into the field. The full-scale field demonstration tested the ability of the new POLO Module to track the path of a small diameter probe as it moved underground.

45 MILITARY TECHNOLOGY, WEAPONRY, AND NATIONAL DEFENSE

8417 (ANL/DIS/CP–84377) **Squeezing out all the performance: Using Ingres for a C^{3}I reporting system.** Tatar, J.J. (Argonne National Lab., IL (United States). Decision and Information Sciences). Argonne National Lab., IL (United States). [1994]. 13p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9410204–2: 1994 Ingres world, Chicago, IL (United States), 2-6 Oct 1994). Order Number DE95004591. Source: OSTI; NTIS; GPO Dep.

Argonne National Laboratory was tasked with developing a data interface between the Joint Theater Level Simulation (JTLS), a military simulation model, and the Warrior Preparation Center C^{3}I reporting system, an Ingres-based application. The problem was to build an application that could take buffered input/output (I/O) from the simulation and trade it for direct I/O into an Ingres database. At the same time, the database could have up to 100 concurrent users through the C^{3}I reporting system, making retrievals and generating reports, so lock contention had to be minimized. One advantage was that events did not have to be reported immediately. Rather, delays in data updates were desired to emulate reporting delays that occur in the real world. Because of the massive amount of state information generated by time series simulations, a single interface could not maintain the database. Therefore, the problem was partitioned among several processes. One process separated the stream, and others maintained the database with state data from the simulation. A number of specific features in the application are reviewed that may be of interest to other developers faced with the problem of developing applications that have a large transaction throughput.

8418 (ANL/DIS/CP–84531) **Facility agreements under the chemical weapons convention inspections.** Tanzman, E.A. Argonne National Lab., IL (United States). 21 Oct 1994. 2p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9410265–2: Continuing legal education seminar on legal implications for business of the chemical weapons convention, Philadelphia, PA (United States), 21 Oct 1994). Order Number DE95004599. Source: OSTI; NTIS; GPO Dep.

The Chemical Weapons Convention (CWC) poses problems of constitutionality, of loss of confidential business information, and even of plant safety. An entirely new and complex worldwide regulatory regime, it nevertheless takes account of the need for certainty in the conduct of industrial production. In particular, the CWC provides for site-specific inspection protocols, called "facility agreements". Facility agreements are not defined in the CWC, but are to be developed as part of the preparations preceding formal entry into force. In effect, they can be thought of as "inspection contracts" governing facilities subject to systematic and routine inspections. Facility agreements are not part of challenge inspections or for cases of alleged use of chemical weapons. The most important fact about facility agreements is that they are not negotiated between the facility owner or operator and the OPCW. Rather, they are negotiated between the State Party and the OPCW. Where United States facilities, such as chemical weapons production facilities, are owned by the government or are under government contract this is not a problem because the government can negotiate on its own behalf. However, where privately owned facilities in the United States enter into facility agreements, the input of those private entities into the terms of the agreement is not guaranteed by the Convention - them OPCW only interfaces with States Parties, not with private firms. The second most important fact is that not all facilities subject to routine inspections must have facility agreements in place. Those declaring chemicals on Schedule 2, Schedule 3 or so-called "other chemical production facilities" may enter into facility agreements, but this is at the option of the State Party.

8419 (BNL–60818) **Program of technical assistance to the organization for the prohibition of chemical weapons, informal report.** Brookhaven National Lab., Upton, NY (United States). [1995]. 108p. Sponsored by Department of Defense, Washington, DC (United States);Defense Nuclear Agency, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95004843. Source: OSTI; NTIS; GPO Dep.

Currently, U.S. organizations provide technical support to the U.S. Delegation for its work as part of the Preparatory Commission (PrepCom) of the Organization for the Prohibition of Chemical Weapons (OPCW) in The Hague. The current efforts of the PrepCom are focussed on preparations for the Entry-Into-Force (EIF) of the Convention on the Prohibition of the Development, Production, Stockpiling and Use of Chemical Weapons (often referred to as the "Chemical Weapons Convention" (CWC)). EIF of the CWC is expected in 1995, and shortly thereafter the PrepCom will cease to exist, with the OPCW taking over responsibilities under the CWC. A U.S. program of technical assistance to the OPCW for its verification responsibilities may be created as part of U.S. policy objectives after EIF of the CWC. In the summary below, comments by participants are presented in Square Brackets Some of the same points arose several times during the discussions; they are grouped together under the most pertinent heading.

4501 Chemical Explosions and Explosives

8420 (LA–12752-MS) **An assessment of high-energy explosives and metal contamination in soil at TA-67 (12), L-Site, and TA-14, Q-Site.** Haywood, W.; McRae, D.; Powell, J.; Harris, B.W. Los Alamos National Lab., NM (United States). Jan 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005743. Source: OSTI; NTIS; GPO Dep.

The results of the field investigation to determine the kind and concentration of explosives found in the soil and on articles at sites known to be contaminated with energetic materials are given in this report. We are concerned about safety and health hazards associated with some explosives, nitro-organics and organic nitrates. Results from the use of the old and new field spot-test kits to detect the presence of energetic materials are given. Also included are data from the high-performance liquid chromatography (HPLC) analyses of acetonitrile extracts from Q-Site soil samples, and data from the energy-dispersive x-ray fluorescence (EDXRF) analyses for hazardous metals on the same samples.

8421 (LA–12898-MS) **Hydrolysis of plutonium: Corrosion kinetics in DMSO solutions containing simulated high explosive and water.** Haschke, J.M.; Pruner, R.E. II. Los Alamos

National Lab., NM (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005740. Source: OSTI; NTIS; GPO Dep.

A sequence of experiments is described that address the compatibility of plutonium metal with dimethyl sulfoxide solvent and with solutions containing simulated HMX explosive and simulated explosive plus water. In the absence of water, reaction is slow and forms a thin adherent product layer on clean metal surfaces. Corrosion of oxide-coated plutonium is observed after 15 to 20 days in a solution containing 0.18 mass % (0.11 M) water. After corrosion initiates, the rate accelerates rapidly and attains a value of 0.13 mg Pu/cm^2 h with a surface that is approximately one percent active. Dependence of the Pu + H_2O reaction on water concentration is evaluated using the data from literature sources. Hazards associated with the use of wet dimethyl sulfoxide as a solvent for removing explosives during weapon dismantlement are identified and a simple method for their mitigation is outlined.

8422 (LBL–35946) **Recording experiment on Rainier Mesa in conjunction with a reflection survey.** Johnson, L.R. Lawrence Berkeley Lab., CA (United States). Jun 1994. 20p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC03-76SF00098. DOD Contract F49620-94-1-0197. (CONF-9404100–15: Symposium on the non-proliferation experiment results and implications for test ban treaties, Rockville, MD (United States), 19-21 Apr 1994). Order Number DE95003440. Source: OSTI; NTIS; GPO Dep.

The chemical explosion of the NPE was recorded on the surface of Rainier Mesa along the same line which had previously been the site of a high resolution reflection survey. Six three-component accelerometer stations where distributed along the 550 meter line, which was offset about 600 meters from the epicenter of the explosion. The bandwidth of the acceleration data extends to 100 Hz. Even though the separations of the stations was only about 100 meters, the waveforms and the amplitudes exhibited considerable variability, especially for the transverse component of motion. The maximum accelerations ranged between 0.27 g and 1.46 g, with the maximums of the average traces being 0.57 g on the radial component, 0.28 on the transverse component, and 0.50 g on the vertical component. Using the results of the reflection survey to help constrain the velocity model, the acceleration data were inverted to obtain a preliminary estimate of the seismic moment tensor of the NPE. This result is a strong diagnostic for the NPE being an explosion, showing a somewhat asymmetric extensional source with very small shear components. When interpreted in terms of a spectral model and scaling relationships, the isotropic moment tensor indicates a yield of 1.4 kt, an elastic radius of 116 meters and a cavity radius of 15.5 meters. This interpretation includes a source time function which contains appreciable overshoot, and, if shown to be reliable, this feature of the explosion could have a significant effect upon the analyses of other types of seismic data.

8423 **Synthesis of 3,6-diamino-1,2,4,5-tetrazine.** Coburn, M.D.; Ott, D.G. To Dept. of Energy. 1992. Filed date 24 Nov 1992. U.S. Patent Application 7-980,892. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95006103. Source: OSTI; NTIS (US Sales Only); GPO Dep.

This invention is a method of making 3,6-diamino-1,2,4,5,-tetrazine (compound 5, DATZ), which is useful as a precursor to 3,6-diamino-1,2,4,5,-tetrazine-1,4-dioxide, a new explosive currently being evaluated at Los Alamos National Laboratory. To prepare compound 5, DATZ, triaminoguanidine monohydrochloride (compound 1) in water solution is combined with 2,4-pentanedione (compound 2) to form a precipitate comprised of 3,6-bis(3,5-dimethylpyrazol-1-y1)-1,2- dihydro-1,2,4,5-tetrazine (compound 3). A mixture of compound 3 in a suitable solvent is contracted with nitric oxide (NO) or nitrogen dioxide (NO_2) to form 3,6-bis(3,5-dimethylpyrazol-1-y1)-1,2,4,5- tetrazine (compound 4). The NO or NO_2 is then removed from the mixture by passing an inert gas through the mixture or, alternatively, compound 4 is separated from the mixture and mixed with fresh solvent to form a mixture free of NO and NO_2. The mixture is contacted with ammonia (NH_3), first at a temperature below about 35 C and then at a temperature above about 50 C, to form 3,6-diamino-1,2,4,5-tetrazine and 3,5-dimethyl-1H-pyrazole (compound 7). A preferred solvent is 1-methyl-2-pyrrolidinone (NMP).

8424 (SAND–94-1990C) **Crushable structure performance determined from reconstructed dynamic forces during impact tests.** Bateman, V.I. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9410187–4: Shock and vibration symposium, San Diego, CA (United States), 31 Oct 1994). Order Number DE95004545. Source: OSTI; NTIS; GPO Dep.

A force reconstruction technique has been used to assess the dynamic performance of a crushable structure (a bomb nose) in both the axial (90°) and slapdown (30°) impact conditions. The dynamic force characteristics for the nose design, determined from these test results, have been used to write a dynamic force specification for a new nose design that will replace the old nose. The dynamic forces are reconstructed from measured acceleration responses with the Sum of Weighted Accelerations Technique (SWAT) developed at Sandia National Laboratories. Axial characterizations for the old nose are presented from tests at two SNL facilities: a rocket rail launcher facility and an 18-Inch horizontal actuator facility. The characterizations for the old nose are compared to the characterizations for two new nose designs. Slapdown characterizations for the old nose are presented. Incorporation of the test results into a dynamic force specification is discussed.

4502 Nuclear Explosions and Explosives

8425 (SAND–94-3252) **Violent reaction source term study.** Sagartz, M.J. Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95005913. Source: OSTI; NTIS; GPO Dep.

Six explosive "source term" tests involving progressively milder explosions were conducted in the aerosol test facility of Department 9614. The tests were designed to simulate a low order initiation of the high explosive in a nuclear weapon primary. All of the tests involved spherical shells of explosive, detonated at one point, imploding a thin sterling silver spherical shell. The amount of silver aerosolized in the test was determined by sampling the atmosphere in the test chamber after the explosion. Numerical simulations of the tests were done using the CTH shockwave code. Results of these calculations show that in all cases the imploding silver impacts at a central point into an almost solid metal mass. The impact heats the silver, melting a fraction of the material and, sometimes, also vaporizing some material. The amount of aerosolized silver appears to be related to the amount of melted material, which decreased dramatically for the more mild explosive tests.

8426 (UCRL-ID–119479) **KERNVILLE, containment data report.** Hudson, B.; Stubbs, T.; Heinle, R. Lawrence Livermore National Lab., CA (United States). Dec 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95005659. Source: OSTI; NTIS; GPO Dep.

The KERNVILLE experiment was executed in Hole U20ar of the Nevada Test Site at 10:10 PST on February 15, 1988, on the Pahute Mesa. All early phenomena observed appeared normal, however, cavity collapse reached the ground surface producing a crater having a mean radius of about 61 m and a maximum depth of about 12 m. No radiation arrivals were detected; the KERNVILLE event containment was considered satisfactory.

8427 (UCRL-ID–119551) **HAZEBROOK, containment data report.** Hudson, B.; Stubbs, T.; Heinle, R. Lawrence Livermore National Lab., CA (United States). Dec 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95005660. Source: OSTI; NTIS; GPO Dep.

The HAZEBROOK event was detonated in hole U10bh of the Nevada Test Site. Detonation time was 7:20 AM PST on February

3, 1987. No subsidence was observed. Radiation arrivals were detected to a depth of 122 m in the emplacement hole; however, no radiation was detected above ground. The HAZEBROOK event containment was satisfactory.

4503 Nuclear Explosion Detection

8428 (LBL–35944) **High resolution seismic imaging of Rainier Mesa using surface reflection and surface to tunnel tomography.** Majer, E.L.; Johnson, L.R.; Karageorgi, E.K.; Peterson, J.E. Lawrence Berkeley Lab., CA (United States). Jun 1994. 9p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC03-76SF00098. DOD Contract F49620-94-1-0197. (CONF-9404100–14: Symposium on the non-proliferation experiment results and implications for test ban treaties, Rockville, MD (United States), 19-21 Apr 1994). Order Number DE95003441. Source: OSTI; NTIS; GPO Dep.

In the interpretation of seismic data to infer properties of an explosion source, it is necessary to account for wave propagation effects. In order to understand and remove these propagation effects, it is necessary to have a model. An open question concerning this matter is the detail and accuracy which must be present in the velocity model in order to produce reliable estimates in the estimated source properties. While it would appear that the reliability of the results would be directly related to the accuracy of the velocity and density models used in the interpretation, it may be that certain deficiencies in these models can be compensated by the and amount of seismic data which is used in the inversion. The NPE provided an opportunity to test questions of this sort. In August 1993, two high resolution seismic experiments were performed in N-Tunnel and on the surface of Rainier Mesa above it. The first involved a surface-to-tunnel imaging experiment with sources on the surface and receivers in tunnel U12n.23 about 88 meters west of the NPE. It was possible to estimate the apparent average velocity between the tunnel and the surface. In a separate experiment, a high resolution reflection experiment was performed in order to image the lithology in Rainier Mesa. Good quality, broad band, reflections were obtained from depths extending into the Paleozoic basement. A high velocity layer near the surface is underlain by a thick section of low velocity material, providing a nonuniform but low average velocity between the depth of the NPE and the surface.

8429 (UCRL-CR–116651) **A study of small explosions and earthquakes during 1961–1989 near the Semipalatinsk Test Site, Kazakhstan.** Khalturin, V.I. (Russian Academy of Sciences, Moscow (Russian Federation). Inst. of Physics of the Earth); Rautian, T.G.; Richards, P.G. Lawrence Livermore National Lab., CA (United States). Mar 1994. 64p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-48. DOD Grant F49620-92-J-0497. Order Number DE95005994. Source: OSTI; NTIS; INIS; GPO Dep.

Several Russian sources have stated that 343 underground nuclear explosions were conducted during 1961–1989 at the Semipalatinsk Test Site. However, only 282 of them appear to have been described, in the openly available technical literature, with well-determined coordinates; and only 272 have both good locations and magnitudes. The authors have used regional data from 52 stations to study 65 seismic sources initially thought to be in or near the Semipalatinsk region, additional to the 272 underground nuclear explosions with known locations and magnitudes. Of these 65 events, the authors believe 8 are not explosions on the test site, namely: two earthquakes close to the test site; three earthquakes or chemical explosions 100–300 km from the test site; and three events at greater distances from Semipalatinsk. Of the remaining 57 events: 10 were known to be underground nuclear explosions with known locations and the authors have supplied magnitudes where none were previously available; one was a chemical explosion at Degelen; they believe 21 were underground nuclear explosions; 13 were chemical explosions at Balapan; 8 were chemical explosions elsewhere on the test site; three were either nuclear or chemical explosions; and one was either a chemical explosion or a cavity collapse. The largest magnitude of their 44 possible underground nuclear explosions is around 5 (February 4, 1965, obscured at many teleseismic stations by a large Aleutian earthquake). Others lie in the magnitude range 3.5–4.5, and clearly most have sub kiloton yields. Their data set of small events is important for purposes of evaluating the detection capability of teleseismic arrays, and the detection and identification capability of regional stations.

8430 (ANL/MCS-TM–186) **Computational load in model physics of the parallel NCAR community climate model.** Michalakes, J.G.; Nanjundiah, R.S. Argonne National Lab., IL (United States). Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95005410. Source: OSTI; NTIS; GPO Dep.

Maintaining a balance of computational load over processors is a crucial issue in parallel computing. For efficient parallel implementation, complex codes such as climate models need to be analyzed for load imbalances. In the present study we focus on the load imbalances in the physics portion of the community climate model's (CCM2) distributed-memory parallel implementation on the Intel Touchstone DELTA computer. We note that the major source of load imbalance is the diurnal variation in the computation of solar radiation. Convective weather patterns also cause some load imbalance. Land-ocean contrast is seen to have little effect on computational load in the present version of the model.

8431 (BNL–61230) **Microphysical and compositional influences on shortwave radiative forcing of climate by sulfate aerosols.** Schwartz, S.E.; Wagener, R.; Nemesure, S. Brookhaven National Lab., Upton, NY (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950402–3: 209. American Chemical Society national meeting, Anaheim, CA (United States), 2-7 Apr 1995). Order Number DE95005999. Source: OSTI; NTIS; INIS; GPO Dep.

Anthropogenic sulfate aerosols scatter shortwave (solar) radiation iincident upon the atmosphere, thereby exerting a cooling influence on climate relative to pre-industrial times. Previous estimates of this forcing place its global and annual average value at about -1 W M^{-2}, uncertain to a factor of somewhat more than 2, comparable in magnitude to greenhouse gas forcing over the same period but opposite in sign and much more uncertain. Key sources of uncertainty are atmospheric chemistry factors (yield, residence time), and microphysical factors (scattering efficiency, upscatter fraction, and the dependence of these quantities on particle size and relative humidity, RH). This paper examines these microphysical influences to indentify properties required to obtain more a accurate description of this forcing. The mass scattering efficiency exhibits a maximum at a particle diameter ($\sim$0.5 μm) roughly equal to the wavelength of maximum power in the solar spectrum and roughly equal to diameter typical of anthropogenic sulfate aerosols. Particle size, and hence mass scattering efficiency, increase with increasing on RH because of accretion of water by deliquescent salt aerosols.

8432 (DOE/CE/23810–48) **Materials compatibility and lubricants research on CFC-refrigerant substitutes. Quarterly MCLR program technical progress report, 1 July 1994–30 September 1994.** Szymurski, S.R.; Hawley, M.; Hourahan, G.C.; Godwin, D.S. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States). Nov 1994. 91p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE95005451. Source: OSTI; NTIS; GPO Dep.

The Materials Compatibility and Lubricants Research (MCLR) program supports critical research to accelerate the introduction of CFC and HCFC refrigerant substitutes. The MCLR program addresses refrigerant and lubricant properties and materials compatibility. The primary elements of the work include data collection and dissemination, materials compatibility testing, and methods development. The work is guided by an Advisory Committee consisting of technical experts from the refrigeration and air-conditioning industry and government agencies. The Air-Conditioning and Refrigeration Technology Institute, Inc., (ARTI) manages and contracts multiple research projects and a data collection and dissemination effort. Detailed results from these projects are reported in technical reports prepared by each subcontractor.

8433 (DOE/ER/61364–3) **Use of cloud observations and mesoscale meteorology models to evaluate and improve cloud parameterizations. Technical progress report, 1 October 1993–30 December 1994.** Walcek, C.J. State Univ. of New York, Albany, NY (United States). Atmospheric Sciences Research Center. 28 Dec 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER61364. Order Number DE95006256. Source: OSTI; NTIS; GPO Dep.

The main goal of this research effort is to improve methods for calculating cloud cover within climate models. Until now, cloud cover and heights have been diagnosed from the US Air Force RTNEPH and 3DNEPH archive, and recently, CART measurements are available for analysis. Improved cloud cover formulations have been compared with existing climate model algorithms. The authors earlier conclusions were that relative humidity and convective potential were the strongest factors influencing cloud cover on regional scales. Therefore, they are refining and validating an innovative Single Column Model (SCM) cumulus parameterization for calculating heating and moistening tendencies, and precipitation rates attributable to subgrid-scale convection not resolved by climate models. This SCM will be tested and evaluated using tropical convective measurements (GATE) and they will also be applied to the incoming measurements from the Oklahoma ARM site. Further development and testing of this SCM will improve their ability to predict convective effects and cloud cover in climate models. They will quantify the influence of convection on cloud cover using convective measures derived from this SCM. The output of this research will be a family of validated algorithms for assessing cloud cover under a variety of stable, unstable, continental or oceanic conditions, and an improved cumulus parameterization scheme.

8434 (DOE/ID–10437(93)) **Air Emission Inventory for the Idaho National Engineering Laboratory, 1993 emissions report.** Department of Energy, Idaho Falls, ID (United States). Idaho Operations Office. Jun 1994. 320p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95005045. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the 1993 update of the Air Emission Inventory for the Idaho National Engineering Laboratory (INEL). The purpose of the Air Emission Inventory is to commence the preparation of the permit to operate application for the INEL, as required by the recently promulgated Title V regulations of the Clean Air Act. The report describes the emission inventory process and all of the sources at the INEL and provides emissions estimates for both mobile and stationary sources.

8435 (DOE/NV/10845–42) **Community radiation monitoring program. Annual report, October 1, 1992–September 30, 1993.** Cooper, E.N. Nevada Univ., Las Vegas, NV (United States). Water Resources Center. Aug 1994. 115p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE95005667. Source: OSTI; NTIS; INIS; GPO Dep.

The Community Radiation Monitoring Program (CRMP) is a cooperative effort between the US Department of Energy (DOE), the US Environmental Protection Agency (EPA), the Desert Research Institute (DRI), a division of the University and Community College System of Nevada, and the Nuclear Engineering Laboratory of the University of Utah (UUNEL). The thirteenth year of this program began in the fall of 1992, and the work continues as an integral part of the DOE–sponsored long-term offsite radiological monitoring effort that has been conducted by EPA and its predecessors since the inception of nuclear testing at the Nevada Test Site (NTS). The CRMP began by enhancing and centralizing environmental monitoring and sampling equipment at 15 communities in the then-existing EPA monitoring network around the NTS, and has since expanded to 19 locations in Nevada, Utah, and California. The primary objectives of this program are still to increase the understanding by the people who live in the area surrounding the NTS of the activities for which DOE is responsible, to enhance the performance of radiological sampling and monitoring, and to inform all concerned of the results of these efforts. One of the primary methods used to improve the communication link with the people in the potentially impacted area has been the hiring and training of local citizens as Station Managers and program representatives in those selected communities in the offsite area. These mangers, active science teachers wherever possible, have succeeded through their training, experience, community standing, and effort in becoming a very visible, able, and valuable asset in this link.

8436 (DOE/PC/91293–12) **Direct catalytic decomposition of nitric oxide. Quarterly technical progress report number 12, July–September, 1994.** Flytzani-Stephanopoulos, M. (Tufts Univ., Medford, MA (United States). Dept. of Chemical Engineering); Sarofim, A.F.; Zhang, Y. Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Chemical Engineering. [1994]. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91293. Order Number DE95005202. Source: OSTI; NTIS; GPO Dep.

This project investigates a suitable catalyst system for the direct NO decomposition in post-combustion NO_x control. The process does not use a reductant, such as ammonia used in the case of Selective Catalytic Reduction (SCR) of NO_x to nitrogen. Therefore, it is a greatly simplified process basically involving passing the flue gas through a catalytic converter. Catalysts are prepared by incorporating metal cations into zeolite supports according to ion exchange procedures widely used in preparation of metal/zeolite catalysts. Particular emphasis is given in this work on promoted Cu-exchanged zeolites, especially the catalysts Mg/Cu-ZSM-5 and Ce/Cu-ZSM-5, which are promising for NO conversion to nitrogen at typical flue gas O_2 and NO levels and over the temperature range of 723–873 K. Effects of zeolite modification, copper exchange level and catalyst preparation conditions on the catalyst activity are studied in a packed-bed microreactor. Kinetic and selectivity studies are conducted over a wide range of P_{NO}/P_{O_2} and temperature with promoted and unpromoted Cu-ZSM-5. Structural characterization of the catalyst employs STEM/EDX analysis, XRD, XPS, EPR and luminescence analyses. A combination of techniques, including ^{27}Al NMR was used to identify the stabilization role of Ce^{3+} in Cu-ZSM-5 under wet NO decomposition conditions. This quarterly report is in the form of a manuscript to be submitted for publication, entitled "Positive effect of cocations in Cu-ZSM-5 on the activity of nitric oxide decomposition in the presence of water."

8437 (FAAR–23/1993) **Report series in aerosol science.** Haemeri, K.; Mikkanen, P.; Kauppinen, E. (eds.). Finnish Association for Aerosol Research, Espoo (Finland); Technical Research Centre of Finland, Espoo (Finland). Aerosol Technology Group. 1993. 292p. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). Order Number DE95737628. Source: OSTI; NTIS.

The Fifth Finnish Aerosol Symposium is held in June 1-3, 1993. Symposium is jointly organized by FAAR (Finnish Association for Aerosol Research), Aerosol Technology Group of Technical Research Centre of Finland and Helsinki University, Department of Physics. Aerosols, the suspensions of solid and liquid particles and gases, are receiving increasing importance in many areas of science and technology. These include industrial hygiene, ambient and indoor air pollution, pollution control technologies, cloud physics, nuclear safety engineering, combustion science and engineering, clean manufacturing technologies and material processing. The importance of aerosol issues during the development of advanced fuel conversion and material processing technologies can be realized when looking at the numerous papers presented on these topics at the Symposium.

8438 (FAAR–23/1993, pp. 48-53) **A model for gas exchange through stomata.** Vesala, T. (Helsinki Univ. (Finland).

Dept. of Physics); Kulmala, M.; Lushnikov, A.A.; Hari, P. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

Ordinary diffusion of gases from (or into) a sub-stomatal cavity through a stomatal pore into (or from) the ambient air is considered. The formulation of molar flux densities for trace components (CO_2 and e.g. gaseous pollutants) includes the coupling between transport of water vapour. Analytical molar flux expressions are presented in terms of the concentration difference between the cavity and the ambient air. The correction factors for the influence of a steady wind and the interference between pores are presented. The interference is found to be important once stomata were not almost closed. The wind reduces the interference. The direct effect of water vapour diffusion on the transport of trace gases is shown to be marginal. (orig.)

8439 (FAAR–23/1993, pp. 59-64) **The structure of combustion-generated aerosol particles.** Sarofim, A.F. (Massaschusetts Inst. of Technology, Cambridge, MA (United States). Dept. of Chemical Engineering); Helble, J.J. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

The presentation will first review the understanding that has developed of the factors that govern the size, shape, and composition of combustion-generated aerosols. It will then provide some suggestions of how this detailed information can be used for diagnostic purposes, and how this effort will require further developments in the analytical tools, experimental and theoretical, provided by the aerosol scientist. Aerosols from combustion sources can be derived from either the inorganic or organic content of fuels and are strongly dependent on fuel type and combustion conditions. In this short review the emphasis will be on the ash derived from coal combustion and the carbonaceous particles, primarily soot and its associated hydrocarbons, from hydrocarbon fuels. The general principles governing the formation of these aerosols, however, apply generally to particles produced by other combustible matter.

8440 (FAAR–23/1993, pp. 105-107) **Theoretical studies on electrical agglomeration of a bimodal aerosol.** Lehtinen, K.E.J. (Technical Research Centre of Finland, Espoo (Finland). Aerosol Technology Group. Nuclear Engineering Lab.); Jokiniemi, K.J.; Kauppinen, E.; Hautanen, J. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

An aerosol with a bimodal mass distribution m(d) and charge distribution q(d) flows into an alternating electric field $E = E_0 \cos(2\pi f t)$ with constant gas velocity. The fine particle mode has a mass median diameter in the range 0.05-0.5πm and the large particle mode > 1μm respectively. The reason for our interest to remove the fine mode particles is that this mode represents the range where most flue gas cleaning methods have deficiencies. The particles start to oscillate with velocities and amplitudes depending on particle size: The fine particles remain almost still when compared to the larger oscillating amplitude of the large particles. This causes coagulation. The aim is to solve the coagulation efficiency i.e. to find out the amount of mass in the fine mode that is removed by coagulation with the large mode.

Effects of nitric acid vapour on the cloud droplet distribution have been simulated with a one-dimensional convective cloud model. Changes in the shortwave radiative properties caused by changes in the droplet distribution are calculated and results compared in different cases. Possible effects on global shortwave properties are discussed. (orig.)

8443 (FAAR–23/1993, pp. 138-143) **Polar stratospheric cloud formation: Nucleation and freezing mechanisms of nitric acid and sulphuric acid aerosols.** Laaksonen, A. (Helsinki Univ. (Finland). Dept. of Physics); Kulmala, M.; McKenzie, A.R. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

Nucleation theory may usefully serve as a guide to which of the possible pathways are at all probable. In this work we study theoretically both the homogeneous and heterogeneous freezing of SAT (sulphur acid trihydrate) and NAT (nitric acid trihydrate) from sulphuric acid and nitric acid water solutions have been studied, and estimate the maximum supercoolings of the liquid phases has been estimated. We also investigate the relative importance of the various possible nucleation mechanisms of SBS (supercooled binary HNO_3-H_2O solution), NAT, and NAD (nitric acid dihydrate) on stratospheric SAT particles have been investigated.

8444 (FAAR–23/1993, pp. 149-154) **Correlations between CN and SO_2 concentrations at Vaerriae research station.** Ahonen, T. (Helsinki Univ. (Finland). Dept. of Physics); Aalto, P.; Korhonen, P.; Haemeri, K.; Kulmala, M.; Hari, P. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

This work includes some results of the examination of observations made at Vaerriae research station in Eastern Lapland. Surface ozone, CN, SO_2 and CO_2 profiles, temperature, sun radiation, pressure, wind speed, wind direction, humidity during warm period and some other factors are measured continuously at the station. This work is concentrated on finding some relations between different factors by calculating correlation coefficients and classifying data by wind direction. A clear correlation between SO_2 and CN concentrations has been shown in a remote area of northern Finland during pollution events. During a high SO_2 concentration episode the strong correlation can be explained by formation of new particles. However, the results are still preliminary and the final conclusions need still further investigations. In the future wider analysis including the essential photochemistry and aerosol dynamics will be performed in order to indicate the possible homogeneous nucleation events in atmospheric conditions.

8445 (FAAR–23/1993, pp. 155-159) **Comparison of denuder systems, a virtual impactor and a Berner low-pressure impactor for determination of nitrate aerosol.** Pakkanen, T. (Finnish Meteorological Inst., Helsinki (Finland)); Hillamo, R.; Maekinen, M.; Maekelae, T.; Virkkula, A.; Kerminen, V.M. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

In this work six different denuder systems (DS), a virtual impactor (BLPI) and a Berner low-pressure impactor were compared for determination of atmospheric nitrate aerosol. The field experiment was conducted during the Nordic NO_3 and NH_4^+ Gas/particle Intercomparison in Helsinki, 11-22 May, 1992. Six groups from Finland, Sweden, Denmark and Norway participated the intercomparison. The VI collected coarse particles on 47 mm diameter polycarbonate filters (Nuclepore Corp.) and fine particles on 3 μm

pore size, 47 mm teflon filters (Millipore Corp.) and 47 mm, 1 μm pore size nylon back-up filters (Gelman). The nylon filters collected the nitrate evaporated from the teflon filters. The VI collected 21 % and 37 % more nitrate than the denuder systems and the BLPI, respectively. These differences can be explained by evaporation of fine particle nitrate from the BLPI and poor collection of coarse particle nitrate by the denuder systems. The fine particle nitrate evaporation from the BLPI was estimated to be on the average 33 % or 57 % as calculated from the DS values or from the VI, respectively. These conclusions are based on the fact that similar filter packs (teflon filter + nylon filter) in the VI and in a denuder system collected similar amounts of nitrate on the nylon filters. However, since the material of the VI used in this study (stainless steel) was not tested for nitric acid there still is the possibility that some gaseous nitric acid may be collected by the VI nylon filters.

8446 (FAAR–23/1993, pp. 209-213) **On the detection efficiency of ultrafine CNC at 1-3 nm size range.** Mavliev, R. (Siberian Branch of the Russian Academy of Sciences, Novosibirsk (Russian Federation). Inst. of Chemical Kinetics and Combustion); Jokinen, V.; Maekelae, J.M. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science.* 292p. Order Number DE95737628. Source: OSTI; NTIS.

Ultrafine aerosol particles are in central position in several gas-to-particle conversion mechanisms in both atmospheric and industrial processes. In those fields Ultrafine Condensation Nucleus Counter (UFACNC TSI 3025) plays an important role. UFACNC is an instrument for counting ultrafine particles. A study on the UFACNC detection efficiency at 1-10 nm using sulphuric acid particles was performed. To conclude the results, an unexpectedly high detection efficiency has been observed for UFACNC using ultrafine sulphuric acid particles. First of all, there is no theoretical explanation for this neither by diffusion broadening of DMA transfer function nor by activation of ultrafine particles in the CNC. Effect might be caused by ion induced nucleation. Thus, one possibility could be to explain the result by the chemical nature of sulfuric acid. Altogether, to explain all the data up to now seems to require much more attention into reconsideration of theory on heterogeneous nucleation process on the CNC conditions. Observations regarding the differencies in activation between sulfuric acid and sodium chloride particles have been made.

8447 (GKSS–94/E/7) **Release of dinitrous oxide from intertidal sediments - illustrated by the example of the Elbe estuary (Muehlenberger Loch) and coastal tidal region (Koenigshafen/Sylt).** Mathieu, B. GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Chemie; Kiel Univ. (Germany). Mathematisch-Naturwissenschaftliche Fakultaet. 1994. 189p. (In German). Order Number DE95738720. Source: OSTI; NTIS (US Sales Only).

The exchange of nitrous oxide (N_2O) between intertidal sediments and the atmosphere has been measured in situ with a closed chamber technique. 1991/92 in various seasons the N_2O net fluxes at the sampling site in the Elbe estuary (Muehlenberger Loch near Hamburg) directed from sediment to atmosphere ranged from 0.05 to 0.40 μmol.m^{-2}.h^{-1} during the day and to 0.64 μmol.m^{-2}.h^{-1} at night - with one exception in winter, when it was zero. During low tide the high initial N_2O concentration in porewater decreased but no less than 10 to >100 fold supersaturation as nitrate and oxygen profiles were changing. The sandy and nutrient-poor marine sediments of the Koenigshafen on the island of Sylt (North Sea) contained very small amounts of N_2O and seemed in summer to be a sinkl rather than a source for atmospheric N_2O. Incubation of a sediment suspension and of intact cores in the laboratory under defined conditions also showed strong influence of photosynthetic activity and the nitrogen and carbon content of the sediment on microbial nitrification/denitrification rates and thus on N_2O release. (orig.)

8448 (GKSS–94/E/13) **Volatile organic compound control technology by means of membranes.** Ohlrogge, K. GKSS-Forschungszentrum Geesthacht GmbH (Germany). Inst. fuer Chemie. 1994. 16p. Order Number DE95738574. Source: OSTI; NTIS (US Sales Only).

In 1989 the first vapor recovery unit (VRU) based on membrane technology was commissioned for off-gas treatment in a gasoline tank farm. At present 20 membrane VRU's are in operation or in construction phase. The capacity of these units range from 100 to 2000 m^3/h. These are single membrane stages or hybrid systems of a membrane stage combined with a post treatment facility, e.g. catalytic incinerator, gas engine or pressure swing adsorption. Small scale membrane applications such as VOC control equipment at the point of use have obtained a growing acceptance in the chemical and pharmaceutical industry. The developments of the last 5 years and the operating experience of commercialized plants are discussed below. (orig.)

8451 (IAEA-TECDOC–721, pp. 181-186) **Oxygen-18 content of modern vegetal organic matter in Senegal; relation with climatic parameters.** Fall, M. (C.A. Diop Univ., Dakar (Senegal). Dept. de Geologie); Faye, A.; Ferhi, A.; Aranyossy, J.F.; Saos, J.L. International Atomic Energy Agency, Vienna (Austria). Oct 1993. (In French). In *Water resources in the Sahel. Hydrogeological and hydrological studies in West Africa by isotopic techniques. Statement of accounts of studies carried out in the framework of the project RAF/8/012: Isotopic hydrology in Sahelian countries.* 211p. Order Number DE95615467. Source: OSTI; NTIS (US Sales Only); INIS.

In Senegal, precipitations present a latitudinal repartition from 1700 mm/year in the south to 300 mm/year in the north. In this context, isotope study of Acacia albida tree-rings, sampled across the rainfall gradient, evidence significant correlation between $\delta^{18}O$ in wood and relative humidity which is directly related to the rainfall, and inversely related to the temperature. Indeed, the Acacia rings $\delta^{18}O$ contains a climatic information reflecting local climate parameters. (author). 18 refs, 5 figs.

8452 (INIS-mf–14416) **Measurement of volumic activities of radon in air in houses and in working rooms with solid state nuclear track detectors.** Hakam, O.K. Universite Mohammed 5, Rabat (Morocco). Faculte des Sciences. 1993. 132p. (In French). Order Number DE95612434. Source: OSTI; NTIS (US Sales Only); INIS.

In this work, a new method of measuring volumic activity of radon has been developed. This method is based on using solid state nuclear track detectors LR-115 type II. It has been applied to measurement of volumic activities of radon in air in houses and in working rooms in different regions of Morocco. These measurements, carried out for the first time in the country, allowed to estimate the dose equivalents of radon received by the population of the studied regions. 59 refs., 38 figs., 38 tabs. (F.M.).

8453 (INIS-mf–14436, pp. O9.1-O9.15) **A new monitoring network in the surroundings of old uranium mine spoil banks in the Pribram district sites.** Hemer, M. (Utvar Hygieny Prace Uranoveho Prumyslu, Kamenna (Czech Republic)); Solnicka, H. No

corporate text available. Oct 1993. 157p. (In Czech). (CONF-9310403–: The mining Pribram in science and technology, Pribram (Czech Republic), 13-16 Oct 1993). In *The mining Pribram in science and technology. Section O: Mining and the environment.* Order Number DE95612417. Source: OSTI; NTIS (US Sales Only); INIS.

The results are given of radioactivity monitoring at air contamination measuring sites in the surroundings of uranium mine spoil banks in the Pribram district. The radionuclide contents of soil and fallout are not significantly different from those at other measuring sites in the Czech Republic. The values of photon dose equivalent rate also approach the all-country averages, except at places where the detector is directly located at the abandoned mine site. (J.B.). 5 tabs., 1 fig., 7 refs.

8454 (INIS-mf–14469, pp. 81-104) **Environmental monitoring at Inshas area.** Abdelfattah, A.T.; Essa, M.W.; Gomaa, M.A. Atomic Energy Establishment, Cairo (Egypt). 1991. 106p. (CONF-9110549–: 2. radiation protection and Civil Defence Department Conference, Cairo (Egypt), 7-16 Oct 1991). In *Radiation Protection and Civil defence Department Conference.* Order Number DE95617966. Source: OSTI; NTIS (US Sales Only); INIS.

Environmental monitoring of radiation level in some food-chain samples, air-particulates and other items carried out in Inshas after 1985 indicates that in the period of Chernobyl accident an increase in the level had been noticed exactly on 10 tenth day of the accident. This has been detected easily in air filters than in other samples. Air-particulate sampling outside the research reactor in Inshas together with other gamma spectroscopic analysis of soil, water and plant samples indicate that the vicinity of the reactor is within the natural background level. Inside the reactor, a noticeable level from radon and/or thoron decay products was found when the ventilation of the reactor hall was switched off. During arabia gulf war (Feb,1991) experimental results indicated no presence of artificial radionuclides (such as I-131 and Cs-134,137) either in the air or in other environmental samples. Measured radioactivity was mainly due to radon and thoron daughters. Meteorological data at Inshas local station indicates that the prevailing wind direction was 295 degree (North-west) which is in agreement with that of Helwan station at high altitudes. It is not expected that this wind direction NE or Se will help in carrying radiation debris or gases to inshass (or egypt). 8 tabs, 5 fig.

8455 (IVL-B–1171) **Emission measurements from a urea-based SCR/oxi catalytic NO_x/HC exhaust gas treatment system on board a diesel powered passenger ferry - operation after 12000 hours service.** Cooper, D.; Peterson, Kjell. Swedish Environmental Research Inst., Goeteborg (Sweden). Jan 1995. 13p. Order Number DE95737681. Source: OSTI; NTIS.

As an extension of a previous study NO_x hydrocarbons (THC), NH_3 and particulate bound NH_4^+, SO_4^{2-}, and H^+ measurements have been carried out on the exhaust of a 2.5 MW medium speed diesel engine on boards 'MS Aurora of Helsingborg' after 12100 hours service. Two operating cases were studied: * with the exhaust gases passing a urea based SCR/oxi catalyst system (NIXHAUST), and * with the exhaust gases by-passing the NIXHAUST system (baseline case). With normal urea dosage, the NIXHAUST system reduced NO_x levels by 98% and THC by 85% with low NH_3 slip (< 4 ppm). Even with lower urea dosages (90% and 80% of normal) the high reductions were maintained without NH_3 slip penalties. In addition, no NH_4HSO_4 was detected in the particulate fraction of the exhaust at the measurement site. In comparison with the results from earlier measurement campaigns after 800 and 6000 hours operation, individual emission factors have varied somewhat (engine wear, engine service etc.) but the reduction efficiencies with the NIXHAUST system obtained have not altered significantly. 11 refs, 2 figs, 8 tabs

8456 (KE–93006B) **Investigation of technologies for CO_2 separation, fixation and disposal for the prevention of global warming.** Son, Y.M. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Auh, J.M.; Son, J.E.; Sim, K.S.; Kim, S.H.; Kim, J.W.; Min, B.M.; Park, S.C.; Lee, T.K. No corporate text available. Dec 1993. 164p. (In Korean). Order Number DE95744285. Source: OSTI; NTIS (US Sales Only).

Scientific accessments of global warming, which were discussed at various international forums, conferences and meetings, were introduced in this work. Also, various technologies of carbon dioxide treatment were investigated in order to study technical options for the prevention of global warming related on energy consumption. (author). refs., figs., tabs.

8457 (KE–93041G) **A Study on Environmental Pollution Control in the Energy Field.** Son, J.I. (Korea Institute of Energy Research, Taejon (Korea, Republic of)); Son, Y.M.; Kim, S.H.; Sim, K.S.; Min, B.M.; Lee, H.K.; Kim, Y.S.; Kim, C.H.; Choi, W.K.; Park, S.D.; Baik, I.H.; Cho, S.H. No corporate text available. Dec 1993. 304p. (In Korean). Order Number DE95743536. Source: OSTI; NTIS (US Sales Only).

In 1992, emission characteristics of environmental pollutants and carbon dioxide which effect on the global warming were qualitively analysed and set up the direction for the environmental pollution reduction strategy in the domestic energy field. From these basis, in 1993, more detailed environmental pollution reduction strategy were quantitatively reviewed. The emission control strategy of sulfur dioxide and nitrogen oxides which effect on acid rain, particulates and carbon dioxide emitted from energy field were reviewed to meet the emission standards and control levels. Especially, In this project, the reduction strategy of carbon dioxide emission and the separation technology from the flue gas in develope countries were investigated to apply the domestic cases. The technical and economical characteristics of carbon dioxide recovery processes which can be separated from flue gas were evaluated and mathematical model for fixed bed adsorber was investigated to separate from mixed gas with adsorption principles.(author). refs. and figs.

8458 (LA–12814-MS) **Parallel processing of atmospheric chemistry calculations: Preliminary considerations.** Elliott, S.; Jones, P. Los Alamos National Lab., NM (United States). Jan 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005915. Source: OSTI; NTIS; GPO Dep.

Global climate calculations are already saturating the class modern vector supercomputers with only a few central processing units. Increased resolution and inclusion of routines to deal with biogeochemical portions of the terrestrial climate system will soon demand massively parallel approaches. The atmospheric photochemistry ensemble is intimately linked to climate through the trace greenhouse gases ozone and methane and modules for representing it are being attached to global three dimensional transport and GCM frameworks. Atmospheric kinetics involve dozens of highly interactive tracers and so will accentuate the need for parallel processing of earth system simulations. In the present text we lay some of the groundwork for addition of atmospheric kinetics packages to GCM and global scale atmospheric models on multiply parallel computers. The discussion is tailored for consumption by the photochemical modelling community. After a review of numerical atmospheric chemistry methods, we examine how kinetics can be implemented on a parallel computer. We concentrate especially on data layout and flexibility and how these can be implemented in various programming models. We conclude that chemistry can be implemented rather easily within existing frameworks of several parallel atmospheric models. However, memory limitations may preclude high resolution studies of global chemistry.

8459 (LA-UR–94-3637) **Radon monitoring using long-range alpha detector-based technology.** Bolton, R.D. Los Alamos National Lab., NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941061–6: Nuclear science symposium: medical imaging conference, Norfolk, VA (United States), 30 Oct - 5 nov 1994). Order Number DE95002729. Source: OSTI; NTIS; INIS; GPO Dep.

Long-Range Alpha Detector (LRAD) technology is being studied for monitoring radon gas concentrations. LRAD-based instruments collect and measure the ionization produced in air by alpha decays. These ions can be moved to a collection grid via electrostatic ion-transport design collected approximately 95% of the radon produced ions, while instruments using an airflow transport design collected from 44% to 77% of these ions, depending on detector

geometry. The current produced by collecting this ionization is linear with respect to ^{222}Rn concentration over the available test range of 0.07 to 820 pCi/L. In the absence of statistical limitations due to low radon concentrations, the speed of response of LRAD-based instruments is determined by the air exchange rate, and therefore changes in radon concentration can be detected in just a few seconds. Recent tests show that at radon concentrations below 20 pCi/L current pulses produced by individual alpha decays can be counted, thus improving detector sensitivity and stability even further. Because these detectors are simple, rugged, and do not consume much power, they are natural candidates for portable, battery operation.

8460 (LBL–34244-Rev.) **Toward resolving model-measurement discrepancies of radon entry into houses.** Garbesi, K. (Univ. of California, Berkeley, CA (United States). Energy and Resources Group). Lawrence Berkeley Lab., CA (United States). Oct 1994. 169p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95004675. Source: OSTI; NTIS; INIS; GPO Dep.

Analysis of the literature indicated that radon transport models significantly and consistently underpredict the advective entry into houses of soil-gas borne radon. Advective entry is the dominant mechanism resulting in high concentrations of radon indoors. The author investigated the source of the model-measurement discrepancy via carefully controlled field experiments conducted at an experimental basement located in natural soil in Ben Lomond, California. Early experiments at the structure confirmed the existence and magnitude of the model-measurement discrepancy, ensuring that it was not merely an artifact of inherently complex and poorly understood field sites. The measured soil-gas entry rate during structure depressurization was found to be an order of magnitude larger than predicted by a current three-dimensional numerical model of radon transport. The exact magnitude of the discrepancy depends on whether the arithmetic or geometric mean of the small-scale measurements of permeability is used to estimate the effective permeability of the soil. This factor is a critical empirical input to the model and was determined for the Ben Lomond site in the typical fashion using single-probe static depressurization measurements at multiple locations. The remainder of the dissertation research tests a hypothesis to explain the observed discrepancy: that soil permeability assessed using relatively small-scale probe measurements does not reflect bulk soil permeability for flows that is likely to occur at larger scales of several meters or more in real houses and in the test structure. The idea is that soil heterogeneity is of a nature that, as flows occur over larger scales, larger scales of heterogeneity are encountered that facilitate larger flux rates, resulting in a scale dependence of effective soil permeability.

8461 (LBL–36379) **Toxic volatile organic compounds in environmental tobacco smoke: Emission factors for modeling exposures of California populations.** Daisey, J.M. (Lawrence Berkeley Lab., CA (United States)); Mahanama, K.R.R.; Hodgson, A.T. Lawrence Berkeley Lab., CA (United States); California State Air Resources Board, Sacramento, CA (United States). Oct 1994. 109p. Sponsored by USDOE, Washington, DC (United States);California State Government, Sacramento, CA (United States). DOE Contract AC03-76SF00098. ARB Contract Number A133-186. Order Number DE95006717. Source: OSTI; NTIS; GPO Dep.

The primary objective of this study was to measure emission factors for selected toxic air contaminants in environmental tobacco smoke (ETS) using a room-sized environmental chamber. The emissions of 23 volatile organic compounds (VOCs), including, 1,3-butadiene, three aldehydes and two vapor-phase N-nitrosamines were determined for six commercial brands of cigarettes and reference cigarette 1R4F. The commercial brands were selected to represent 62.5% of the cigarettes smoked in California. For each brand, three cigarettes were machine smoked in the chamber. The experiments were conducted over four hours to investigate the effects of aging. Emission factors of the target compounds were also determined for sidestream smoke (SS). For almost all target compounds, the ETS emission factors were significantly higher than the corresponding SS values probably due to less favorable combustion conditions and wall losses in the SS apparatus. Where valid comparisons could be made, the ETS emission factors were generally in good agreement with the literature. Therefore, the ETS emission factors, rather than the SS values, are recommended for use in models to estimate population exposures from this source. The variabilities in the emission factors (μg/cigarette) of the selected toxic air contaminants among brands, expressed as coefficients of variation, were 16 to 29%. Therefore, emissions among brands were Generally similar. Differences among brands were related to the smoked lengths of the cigarettes and the masses of consumed tobacco. Mentholation and whether a cigarette was classified as light or regular did not significantly affect emissions. Aging was determined not to be a significant factor for the target compounds. There were, however, deposition losses of the less volatile compounds to chamber surfaces.

8462 (NREL/TP–433-6943) **Review of research results for the photocatalytic oxidation of hazardous wastes in air.** Nimlos, M.R.; Wolfrum, E.J.; Gratson, D.A.; Watt, A.S.; Jacoby, W.A.; Turchi, C. National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004004. Source: OSTI; NTIS; GPO Dep.

Laboratory experiments of gas-phase photocatalytic oxidation (PCO) at NREL have focused on measurements that can help commercialize this technology for treating gaseous air streams. This effort proceeds earlier NREL work and studies conducted elsewhere which demonstrated the general applicability of PCO. The more recent work has concentrated on: (1) the kinetics of the PCO process; (2) the formation and destruction of intermediates; and (3) possible enhancements to improve the destruction rates. The results from these studies will be used to help design large scale PCO equipment and they will be used to evaluate the economics of the PCO process. For trichloroethylene and ethanol, extensive studies of the rates of destruction have yielded kinetic parameters for the destruction of intermediates as well as the substrate. The kinetics of intermediates is essential for sizing a large scale reactor, as complete conversion to carbon dioxide is often desired. The kinetic data from these laboratory studies has been used for analyzing IT's pilot PCO reactor and has been used to suggest modifications to this unit. For compounds that are more difficult to destroy (such as the components of BTEX), rate enhancement experiments have been conducted. These compounds represent a very large market for this technology and improvement of the rate of the process should make it competitive. Towards this goal, the enhancement of the destruction of BTEX components have been studied. Experiments have demonstrated that there is a significant increase in the rates of destruction of BTEX with the addition of ozone. Preliminary economic assessments have shown that PCO with ozone may be cost competitive. Future laboratory experiments of PCO will focus on refinements of what has been learned. Rate measurements will also be expanded to include other compounds representing significant markets for the PCO technology.

8463 (NREL/TP–471-7262) **Overview of solar detoxification activities in the United States.** Mehos, M.; Williams, T.; Turchi, C. National Renewable Energy Lab., Golden, CO (United States). Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95000264. Source: OSTI; NTIS; GPO Dep.

The U.S. Department of Energy, through the National Renewable Energy Laboratory (NREL) and Sandia National Laboratories, has been investigating a process that uses solar energy to destroy hazardous wastes in air and water. The process, photocatalytic oxidation, uses ultraviolet light in conjunction with the semiconductor titanium dioxide to generate highly reactive hydroxyl radicals. Early research and development activities have demonstrated that photocatalysis may be cost effective for some applications. The Department of Energy is currently working to establish a commercial industry that uses solar energy to destroy hazardous wastes in air, water, and soil. To achieve this objective, NREL and Sandia are bringing together environmental firms, solar manufacturers, and organizations that have waste or remediation problems.

8464 (PNL-SA–24394) **Extraction and detection of pesticide residues from air filter inserts using supercritical carbon dioxide.** Zemanian, T.S.; Robins, W.H.; Lee, R.N.; Wright, B.W.

Pacific Northwest Lab., Richland, WA (United States). Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9410114–5: 3. international symposium on supercritical fluids, Strasbourg (France), 17-19 Oct 1994). Order Number DE95004579. Source: OSTI; NTIS; GPO Dep.

Trace quantities of airborne herbicide residues were collected on adsorbent bed cartridges and were subsequently extracted from the adsorbent using supercritical carbon dioxide. An apparatus was constructed to facilitate the extraction and recovery of the desired analytes. The resulting extracts were analyzed using gas chromatography/mass spectrometry (GC/MS) or high performance liquid chromatography (HPLC) techniques. Results are presented for a series of analytes representative of common commercial pesticides or herbicides.

8465 (RPII–94/3) **Radon in dwellings in selected areas of Ireland.** Madden, J.S. (Radiological Protection Inst. of Ireland (Ireland)); Duffy, J.T.; Mackin, G.A.; Colgan, P.A.; McGarry, A.T. Radiological Protection Inst. of Ireland (Ireland). Oct 1994. 30p. Order Number DE95612435. Source: OSTI; NTIS (US Sales Only); INIS.

This report presents and interprets the results of surveys of domestic radon concentrations carried out by the Radiological Protection Institute of Ireland between 1989 and 1992. Data from low-density monitoring surveys in various counties are presented. The highest seasonally-corrected radon level found in any of the 1755 dwellings surveyed was 2399 Bq/m^3. This is twelve times the national Reference Level of 200 Bq/m^3, and corresponds to an annual radiation dose to occupants of the house of 60 mSv, three times the maximum dose which radiation workers are allowed to receive under internationally-accepted standards. Statistical evaluation of the data has allowed classification of 10 km grid square areas on the basis of the predicted proportion of houses in each grid square with radon levels in excess of the national Reference Level, 200 Bq/m^3. The most affected areas occur in counties Mayo and Galway, and to a lesser extent in south-east Cork city. In county Galway six grid squares are predicted to have more than 20% of houses with radon concentrations in excess of 200 Bq/m^3. In the most affected grid square 30% of houses are predicted to have radon concentrations in excess of this level. It is important that householders in these areas be strongly encouraged to have the radon levels in their houses measured in order to identify the individual houses in which remedial measures are required. The risk associated with longterm exposure to radon has been calculated using the latest risk factor recommended by the International Commission on Radiological Protection.

8466 (SAND–94-8238) **The evaluation of potential limonene scavengers.** Roth, R. (Chensyn Science Labs., Lenexa, KS (United States)); Ebert, D.; Shepodd, T.J. Sandia National Labs., Livermore, CA (United States). Jan 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95006853. Source: OSTI; NTIS; GPO Dep.

This work is the study of different scavengers of limonene. Limonene is a citrus-based, low toxicity, hydrocarbon solvent for cleaning circuit boards and other parts. Though almost all limonene evaporates after cleaning procedures, trace residual limonene would be a concern if allowed to migrate freely through a sealed system. This work was charted to investigate materials that would effectively scavenge and permanently immobilize trace limonene. The requirements of a successful scavenger are the following: it must remove >90% of 30 mg/l limonene from a sealed volume with 3 months, at 20–25 C; it must not release any volatiles over prolonged aging; it must be packaged such that limonene vapors can access the scavenger, but not such that the scavenging medium can migrate; and it must operate in the presence of water, oxygen, pentane, toluene, and carbon dioxide gases. A number of adsorbents were evaluated. Additionally, a scheme for scavenging limonene by chemical reaction was investigated at Sandia. This attempt was not successful. The details of this investigation are found at the end of this report.

8467 (SLU-JBT-R–93) **Performance of additives in reducing ammonia emissions from cow slurry.** Andersson, Mats. Swedish University of Agricultural Sciences, Department of Agricultural Biosystems and Technology, Lund (Sweden). 1994. 47p. Order Number DE95737652. Source: OSTI; NTIS.

Ammonia emissions contribute substantially to environmental pollution and cause severe acidification. In Sweden, 20-25% of the total ammonia emission derives from manure in animal buildings. One technique to decrease ammonia emissions from animal buildings is to apply emission-reducing additives in the manure. However, the efficiencies of many of the manure additives on the market have not been determined, and those additives that have been evaluated are difficult to compare due to different test methods and methods of evaluation. The objectives of this study were to investigate the abilities of different manure additives in reducing ammonia emission, for how long they would be efficient, and to which cost the additives can be used. The results show that high reductions (up to 50%) in ammonia emissions are possible to obtain with some of the additives, at least during the first week after the application of the additives. The reductions decrease over time, and they are hardly noticeable after six weeks. The costs to which these additives can be used are high in relation to the amount of nitrogen they save. 33 refs, 3 figs, 13 tabs

8468 (SVF–521) **Stack gas flow measurement based on fan characteristics.** Yli-Juuti, E. (Indmeas Ky Industrial Measurements, Espoo (Finland)); Kuoppamaeki, R. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Dec 1994. 35p. (In Swedish). Order Number DE95737674. Source: OSTI; NTIS.

The aim of the project was to evaluate the accuracy and the stability of the stack gas flow meters used to calculate stack gas emissions. Special attention was given to a new continuous flow measurement method, called the fan method. In this method stack gas flow is continuously calculated from the measured values for differential pressure over the stack gas fan and for its control quantity. The mathematical form of the calculation equation is derived from the fan physics. The values for the constant in the equation are determined from in situ calibration measurements. The project was carried out as case studies on three solid fuel boilers. The boilers were chosen so that their stack gas flow meters, a thermal mass flow meter, a permanently installed pitot tube, and an ultrasonic flow meter were representative of the types most commonly used in Sweden for stack gas flow measurement. The fan method was formulated into a generally applicable measurement method which can be applied to boilers with all kinds of stack gas systems. The observations on the fan method suggested that in order to keep the measurement uncertainty within ± 4% calibrations against a flow rate reference would be needed perhaps only every second year. The results from the first calibrations of the stack gas flow meters showed that after installation and maintenance controls by the site personnel, significant errors often exist in the measurements. These errors must be eliminated by in situ calibration using a reliable flow rate reference. Long term instability was also observed. It was concluded that the flow meters should be calibrated at least twice a year in order to have some confidence that the measurement inaccuracy is below ± 4%. 12 figs

8469 (BHR–80) **Core scanning for Th, U and K. Problems and solutions.** Korsbech, U. Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Elektrofysik. Aug 1994. 66p. Order Number DE95612398. Source: OSTI; NTIS; INIS.

A core scanner with a 10cm x 10cm NaI(Tl) crystal and a 256 channel analyzer has been built and calibrated for spectral gamma-ray measurement of Th, U and K in cores from boreholes. The calibration has been performed for cores of different diameters and densities, and the influence of liners, incomplete cores, and a varying core to detector distances have been investigated. A single formula for determination of the sensitivities for the window method

has been developed. The stability against changes in temperature and radon background is evaluated. Proposals for an improved and faster measuring technique with two or more detectors is put forward. (au).

8470 (DOE/MC/28245–3922) **Soil treatment to remove uranium and related mixed radioactive heavy metal contaminants. Seventh quarterly technical progress report, July 1, 1994–September 30, 1994.** Buckley, L.P. Atomic Energy of Canada Ltd., Chalk River, ON (Canada). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-92MC28245. Order Number DE95006153. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this project is to design and develop a physicochemical treatment process for the removal of uranium and heavy metals from contaminated soil to achieve target contamination levels below 35 pCi/g of soil and a target for non-radioactive heavy metals below concentration levels permissible for release of the soil. The work will involve bench-scale and pilot-scale tests, using chelation-flotation, chemical leaching and ultrasonic leaching techniques, in conjunction with cross-flow microfiltration and filter-press operations. The effectiveness of an integrated process to treat leachates generated from soil processing will be demonstrated. Process flow-sheets suitable for in-situ and ex-situ applications will be developed and preliminary costs will be provided for the soil and leachate treatment technologies. The Task 2 Topical Report (milestone No. 4) summarizing contaminant removal results obtained from bench-scale studies using Fernald uranium soils and Chalk River Laboratories Chemical Pit soils was completed and issued on August 8, 1994. The results have shown that the soils containing uranium (about 400 pCi/g of soil) and strontium-90 (about 1200 pCi/g of soil) can be decontaminated to the target level of 35 pCi/g of treated soil in the presence of an ultrasonic field. Preliminary results obtained from the in-situ soil leaching tests are the average strontium-90 concentration in the cell was about 250 pCi/g; and the use of a dilute mineral acid (0. 1 mol/L HCl) removed in excess of 85% of strontium-90 originally present in the soil.

8471 (DOE/NV/10384–28) **Classification of groundwater at the Nevada Test Site.** Chapman, J.B. Nevada Univ., Reno, NV (United States). Desert Research Inst. Aug 1994. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-85NV10384 ; AC08-90NV10845. Order Number DE95006257. Source: OSTI; NTIS; GPO Dep.

Groundwater occurring at the Nevada Test Site (NTS) has been classified according to the "Guidelines for Ground-Water Classification Under the US Environmental Protection Agency (EPA) Ground-Water Protection Strategy" (June 1988). All of the groundwater units at the NTS are Class II, groundwater currently (IIA) or potentially (IIB) a source of drinking water. The Classification Review Area (CRA) for the NTS is defined as the standard two-mile distance from the facility boundary recommended by EPA. The possibility of expanding the CRA was evaluated, but the two-mile distance encompasses the area expected to be impacted by contaminant transport during a 10-year period (EPA,s suggested limit), should a release occur. The CRA is very large as a consequence of the large size of the NTS and the decision to classify the entire site, not individual areas of activity. Because most activities are located many miles hydraulically upgradient of the NTS boundary, the CRA generally provides much more than the usual two-mile buffer required by EPA. The CRA is considered sufficiently large to allow confident determination of the use and value of groundwater and identification of potentially affected users. The size and complex hydrogeology of the NTS are inconsistent with the EPA guideline assumption of a high degree of hydrologic interconnection throughout the review area. To more realistically depict the site hydrogeology, the CRA is subdivided into eight groundwater units. Two main aquifer systems are recognized: the lower carbonate aquifer system and the Cenozoic aquifer system (consisting of aquifers in Quaternary valley fill and Tertiary volcanics). These aquifer systems are further divided geographically based on the location of low permeability boundaries.

8472 (DOE/NV/10845–35) **The application of borehole logging to characterize the hydrogeology of the Faultless site, Central Nevada Test Area.** Chapman, J.B.; Mihevc, T.M.; Lyles, B.F. Nevada Univ., Las Vegas, NV (United States). Water Resources Center. Aug 1994. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE95003833. Source: OSTI; NTIS; INIS; GPO Dep.

The Central Nevada Test Area was the site of the Faultless underground nuclear test that could be a source of radionuclide contamination to aquifers in Hot Creek Valley, Nevada. Field studies in 1992 and 1993 have used hydrologic logging and water sampling to determine the adequacy of the current groundwater monitoring network and the status of water-level recovery to pre-shot levels in the nuclear chimney. The field studies have determined that there is a possibility for contaminant migration away from the Faultless event though the pre-event water level has not been attained, while new data raise questions about the ability of the current monitoring network to detect migration. Hydrologic logs from the postshot hole (drilled into the chimney created by the nuclear detonation) reveal inflow around 485 m below land surface. The physical and chemical characteristics of the inflow water indicate that its source is much deeper in the chimney, perhaps driven upward in a convection cell generated by heat near the nuclear cavity. Logging and sampling at monitoring wells HTH-1 and HTH-2 revealed that the completion of HTH-1 may be responsible for its elevated water level (as compared to pre-nuclear test levels) and may have also created a local mound in the water table in the alluvium that accounts for higher post-test water levels at HTH-2. This mound would serve to divert flow around the monitoring wells, so that only migration of contaminants through the underlying, higher pressure, volcanic units is currently monitored. A hydraulic high found in an abandoned hole located between the nuclear chimney and the monitoring wells further reduces the likelihood of HTH-1 or HTH-2 intercepting contaminant migration.

8473 (DOE/NV/10845–50) **Potential hydrologic characterization wells in Amargosa Valley.** Lyles, B.; Mihevc, T. Nevada Univ., Reno, NV (United States). Water Resources Center. Sep 1994. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-90NV10845. Order Number DE95005111. Source: OSTI; NTIS; INIS; GPO Dep.

More than 500 domestic, agricultural, and monitoring wells were identified in the Amargosa Valley. From this list, 80 wells were identified as potential hydrologic characterization wells, in support of the US Department of Energy (DOE) Underground Test Area/ Remedial Investigation and Feasibility Study (UGTA/RIFS). Previous hydrogeologic studies have shown that groundwater flow in the basin is complex and that aquifers may have little lateral continuity. Wells located more than 10 km or so from the Nevada Test Site (NTS) boundary may yield data that are difficult to correlate to sources from the NTS. Also, monitoring well locations should be chosen within the guidelines of a hydrologic conceptual model and monitoring plan. Since these do not exist at this time, recompletion recommendations will be restricted to wells relatively close (approximately 20 km) to the NTS boundary. Recompletion recommendations were made for two abandoned agricultural irrigation wells near the town of Amargosa Valley (previously Lathrop Wells), for two abandoned wildcat oil wells about 10 km southwest of Amargosa Valley, and for Test Well 5 (TW-5), about 10 km east of Amargosa Valley.

8474 (ENRESA–08/94) **Mobile units to hydro geochemistry characterization.** Gomez, P.; Martinez, B.; Turrero, M.J. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1994. 58p. (In Spanish). Order Number DE95739356. Source: OSTI; NTIS; INIS.

This report shows the mobile units for hydro geochemical studies. The authors analyze the work of mobile unit and the cars that conform the unit: Sampling car and analysis car: The sampling and equipment are took into account as well.

8475 (ENRESA–10/94) **Study of isotopic desequilibrium of natural radioactive series in granitic environment: Pluton of El Berrocal (Toledo).** Hernandez Benitez, A. Centro de Investigaciones Energeticas, Medioambientales y Tecnologicas (CIEMAT), Madrid (Spain). 1994. 161p. (In Spanish). Order Number DE95739385. Source: OSTI; NTIS; INIS.

This report summarizes the work funded by European Communities with contract " The Berrocal project: characterization and validation of natural radionuclide migration processes under real

conditions in a fissured granitic environment". The author takes into account the following aspects in his study: isotope of natural radionuclides, sampling methods, analytic methodology and geological characteristics of the area.

8476 (ES/ER/TM–96/R1) **Toxicological benchmarks for screening potential contaminants of concern for effects on aquatic biota: 1994 Revision.** Suter, G.W. II (Oak Ridge National Lab., TN (United States)); Mabrey, J.B. Oak Ridge National Lab., TN (United States). Jul 1994. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95005996. Source: OSTI; NTIS; GPO Dep.

This report presents potential screening benchmarks for protection of aquatic life from contaminants in water. Because there is no guidance for screening benchmarks, a set of alternative benchmarks is presented herein. The alternative benchmarks are based on different conceptual approaches to estimating concentrations causing significant effects. For the upper screening benchmark, there are the acute National Ambient Water Quality Criteria (NAWQC) and the Secondary Acute Values (SAV). The SAV concentrations are values estimated with 80% confidence not to exceed the unknown acute NAWQC for those chemicals with no NAWQC. The alternative chronic benchmarks are the chronic NAWQC, the Secondary Chronic Value (SCV), the lowest chronic values for fish and daphnids from chronic toxicity tests, the estimated EC20 for a sensitive species, and the concentration estimated to cause a 20% reduction in the recruit abundance of largemouth bass. It is recommended that ambient chemical concentrations be compared to all of these benchmarks. If NAWQC are exceeded, the chemicals must be contaminants of concern because the NAWQC are applicable or relevant and appropriate requirements (ARARs). If NAWQC are not exceeded, but other benchmarks are, contaminants should be selected on the basis of the number of benchmarks exceeded and the conservatism of the particular benchmark values, as discussed in the text. To the extent that toxicity data are available, this report presents the alternative benchmarks for chemicals that have been detected on the Oak Ridge Reservation. It also presents the data used to calculate benchmarks and the sources of the data. It compares the benchmarks and discusses their relative conservatism and utility.

8477 (FAAR–23/1993, pp. 65-68) **Characterization of soot particles by in situ measurement with different aerosol analysis tools.** Burtscher, H. (ETH-Hoenggerberg, Zuerich (Switzerland). Lab. for Solid State Physics); Matter, D.; Steiner, D. Finnish Association for Aerosol Research, Espoo (Finland). 1993. (CONF-9306401–: 5. Finnish national aerosol symposium, Espoo (Finland), 1-3 Jun 1993). In *Report series in aerosol science*. 292p. Order Number DE95737628. Source: OSTI; NTIS.

Properties of aerosol particles emitted from combustion processes significantly depend on the fuel used and on the characteristics of the combustion as flame temperature, air/fuel ratio etc. Particle analysis therefore is not only important for environmental reasons but can also be used to monitor and optimize the combustion process either when designing a combustion system or during operation in closed loop control systems. first some results from the parallel application of commercial aerosol equipment, mainly Aethalometer and TEOM, will be discussed, which allow to determine emission factors for black carbon (BC) and the ratio of BC-mass concentration to total mass concentration. In a second section features of a newly developed multi-wavelength aerosol photoemission sensor will be discussed, which allows to distinguish between particles from different sources.

8478 (IAEA-TECDOC–721, pp. 7-22) **Development of hydrogeological isotopic techniques in Sahelian countries. General framework and realization of regional project RAF/8/012 (Senegal, Mali, Niger, Cameroon).** Aranyossy, J.F. (Dakar (Senegal)); Gonfiantini, R.; Louvat, D.; Maksoudi, M. International Atomic Energy Agency, Vienna (Austria). Oct 1993. (In French). In *Water resources in the Sahel. Hydrogeological and hydrological studies in West Africa by isotopic techniques. Statement of accounts of studies carried out in the framework of the project RAF/8/012: Isotopic hydrology in Sahelian countries.* 211p. Order Number DE95615467. Source: OSTI; NTIS (US Sales Only); INIS.

Periods of drought strongly affecting the Sahel region during the previous two decades have outlined the precariousness of surface water reserves as well as the need to tap underground water. Extensive programs of ground water exploitation have been initiated throughout the region. Within a few years thousands of boreholes have been put in place. However, prematurely exploited underground layers often demonstrated their qualitative and quantitative vulnerability, thereby showing the need to embark on global studies of water resources, in order to come to as complete an understanding of aquifers as possible. Therefore, the IAEA started its first hydrological activities in Mali, Niger and Senegal within the scope of its Technical Cooperation programs. Isotope studies have revealed communications between layers, the connection between surface and ground water, the occurrence (or absence) of replenishing. The IAEA also put into place the first infrastructures for the application of tracer techniques and the use of nuclear instrumentation, as well as hydro-sedimentology. This document describes the objectives of the Regional African project on "the development of isotopic and nuclear techniques in hydrology in the Sahel countries", as well as the methodology and results (on transport of water and their solubles within the unsaturated soil; the relation between the surface waters and the aquifers; on the origin of piezometric depressions; on "very ancient" aquifers reported on more elaborately in the Ph.D. thesis of Mr. A. Faye of the University of Dakar; hydrological overview; isotopic characterization of water layers and origin of precipitation; isotopic composition of organic materials; study of nitrate pollutants; tracer techniques applied to study the balance of water flow; transport of suspended particles and sediment formation). The document ends with information on training, dissemination and exchange of (Abstract Truncated).

8479 (IAEA-TECDOC–721, pp. 39-51) **Estimation of effective recharge of aquifers under semi-arid conditions: Example in North Senegal.** Tandia, A.A. (C.A. Diop Univ., Dakar (Senegal). Dept. de Geologie); Gaye, C.B.; Aranyossy, J.F. International Atomic Energy Agency, Vienna (Austria). Oct 1993. (In French). In *Water resources in the Sahel. Hydrogeological and hydrological studies in West Africa by isotopic techniques. Statement of accounts of studies carried out in the framework of the project RAF/8/012: Isotopic hydrology in Sahelian countries.* 211p. Order Number DE95615467. Source: OSTI; NTIS (US Sales Only); INIS.

Application of various "classical methods' for the estimation of effective infiltration rate to the phreatic aquifer in North Senegal, results in a large range of values (from 0 to 95mm.an^{-1}). Chlorine balance method gives, on the basis of 11 profiles, a smaller range of values between 6.7 and 80.5 mm.y^{-1}. In this situation, the location of the bomb tritium signal in deep unsaturated soil zone, appears to be the most effective method for evaluating recharge. Tritium peaks, found in two profiles at respectively 12 and 20 m depth in the sand dunes formation near Louga, has provided an infiltration rate estimate of 22 to 26 mm.y^{-1}. (author). 21 refs, 6 figs, 5 tabs.

8480 (IAEA-TECDOC–721, pp. 53-63) **Importance of evaporation processes in the formation of the piezometric depression in Sahelian region: Hypothesis and modelling.** Ndiaye, B. (C.A. Diop Univ., Dakar (Senegal). Dept. de Geologie); Aranyossy, J.F.; Faye, A. International Atomic Energy Agency, Vienna (Austria). Oct 1993. (In French). In *Water resources in the Sahel. Hydrogeological and hydrological studies in West Africa by isotopic techniques. Statement of accounts of studies carried out in the framework of the project RAF/8/012: Isotopic hydrology in Sahelian countries.* 211p. Order Number DE95615467. Source: OSTI; NTIS (US Sales Only); INIS.

Results of the environmental isotopic studies carried out in Sahelian countries (Mali, Senegal, Niger, North-Cameroon) seem to attribute major importance to evaporation and transpiration processes in the formation of the regional piezometric depressions. The conceptual model developed on the basis of this theory considers a large time scale evolution corresponding to the global climatic change from the last holocene pluvial period to now. The vertical water deficit is considered, in each point, as exponentially decreasing with the water table depth. An analytical model is first presented to check this hypothesis and to analyze the importance of the different parameters involved in the formulation. A transient

numerical model is then described to depict, in one dimension, the evolution of an unconfined aquifer between two constant head boundaries. Simulation of a 8000 years evolution generates a figure in conformity with the piezometric profile observed in the field. (author). 14 refs, 7 figs.

Source: OSTI; NTIS (US Sales Only); INIS.

A chemical and stable isotopes study (0-18, H-2) has been carried out on the aquifers located in the 'dallol Bosso' region at about 100km eastward of the capital Niamey. Preliminary results demonstrate: (1) that the alluvial aquifer is mainly recharged by direct infiltration of runoff and rainwater but also shown, in some places a mixture with oldest water coming from the upward drainage of the underlying "Continental Terminal" aquifer; (2) the "direct recharge" is efficient and quick but directly dependant on the precipitation variability while the "deep recharge" (the value of which has not been yet quantified) is certainly more constant. Chemical and isotopic results also suggest that quite important water losses are taking place through evaporation processes. (author). 11 refs, 9 figs.

8482 (IAEA-TECDOC–721, pp. 77-93) **Impact of environmental isotopes in the fissured aquifer study in Mali.** Sidoro, M. (Direction Nationale de l'Hydraulique et de l'Energie, Bamako (Mali)); Guerre, A.; Aranyossy, J.F. International Atomic Energy Agency, Vienna (Austria). Oct 1993. (In French). In *Water resources in the Sahel. Hydrogeological and hydrological studies in West Africa by isotopic techniques. Source: OSTI; NTIS (US Sales Only); INIS.

Interpretation of environmental isotopes in fissured au Mali has led to an improvement of the general knowledge obtained through classical hydrogeology and piezometric measurements. Tritium concentrations has proved the occurrence of important renewable water resources in the western and southern fissured aquifers of the country, even in the Sahelian zone. For this aquifer's type however, the recharge rate mainly depends on the lithology, the granulometry and the thickness of the superficial layers. Stable isotope contents and C-14 activities have confirmed the general present origin of most of the water bodies. However, some fossil water, recharged during the last humid Holocene period, has been demonstrated in precambrian sedimentary formations. The spatial distribution of isotope contents does not show any regional trends. It demonstrates the main importance of local circulation and evaporation in the natural water balance. (author). 16 refs, 8 figs, 5 tabs.

8483 (IAEA-TECDOC–721, pp. 95-105) **Environmental isotopic study of the Korama aquifers, south of Zinder (Niger).** Zakara, Z. (Direction Departementale de l'Hydraulique, Maradi (Niger)); Karbo, A.; Aranyossy, J.F. International Atomic Energy Agency, Vienna (Austria). Oct 1993. (In French). In *Water resources in the Sahel. Hydrogeological and hydrological studies in West Africa by isotopic techniques. Source: OSTI; NTIS (US Sales Only); INIS.

A first environmental isotope study has been carried out on the "Korama" aquifers located in the southern part of the city of Zinder (Niger). Preliminary interpretation confirms that most of the aquifers are presently recharged by direct infiltration of rainwater. Structural fractures seem to play an important role in the water circulation allowing vertical drainage of oldest water coming from deeper aquifers and facilitating the recharge by surface water in the prheatic zone. It does not appear any difference between the so-called "superficial Korama" and the "Deep Korama" aquifers on the basis of the isotopic compositions. (author). 11 refs, 7 figs, 2 tabs.

8484 (IAEA-TECDOC–721, pp. 107-122) **Environmental isotopic study of the "Grand Yaere" aquifers (North-Cameroon).** Ketchemen, B. (C.A. Diop Univ., Dakar (Senegal). Source: OSTI; NTIS (US Sales Only); INIS.

The Grand Yaere ("alluvial plain" and "Yaere plain ss") belongs to the "Great Chadian sedimentary basin". Aquifers are hosted in the last-Tertiary formations and Quaternary deposits linked to the Chad lake fluctuations. Interpretation of environmental isotope data on precipitation, surface water and groundwater has led to an understanding of the general hydrogeologic scheme. The main aquifer recharge zone is localized in the alluvial plain at the piedmont of the Mandara mountains. Surface water spread on the plain by seasonal floods are totally lost by evapotranspiration. Furthermore, it appears that the "generalized Yaere aquifer" should be divided in an upper part - with recent water - and a deeper part holding fossil water. Consequently, the depth of the piezometric depressions is certainly lower than it was before considered. (author). 19 refs, 9 figs, 4 tabs.

8485 (IAEA-TECDOC–721, pp. 123-132) **Contribution of environmental isotopes in the hydrogeological study of the Casamance's aquifers (South of Senegal).** Faye, A. (C.A. Diop Univ., Dakar (Senegal). Dept. de Geologie); Tandia, A.A.; Travi, Y.; Le Priol, J.; Fontes, J.C. International Atomic Energy Agency, Vienna (Austria). Oct 1993. (In French). In *Water resources in the Sahel. Source: OSTI; NTIS (US Sales Only); INIS.

Environmental isotopes study (^{18}O, ^{2}H, ^{14}C, ^{13}C) on the aquifers of the Casamance region has provided new information in addition to "classical" hydrogeological investigations. (1) The "Continental Terminal" aquifer, in the Sedhiou-Marsassoum basin, is characterized by recent non evaporated water. Its recharged correspond to the direct infiltration of present precipitation. (2) The Oligo-Miocene aquifer recharge proceeds from two different origins: a direct recharge from precipitation and a vertical upward drainage from the Maastrischian formations. (3) the C-14 activities in the Maastrischian aquifer confirm that a present recharge still occurs on the Eastern edge of the basin where the formation outcrops in contact on the crystalline basement. In the western part of the Oligo-Miocene and Maastrischian aquifers, ^{14}C activities become extremely low and groundwater datation needs long-live radiochronometers. (author). 5 refs, 7 figs, 7 tabs.

8486 (IAEA-TECDOC–721, pp. 133-145) **Natural groundwater recharge in the Garoua basin (North-Cameroon): Hydrochemical and isotopic approaches.** Njitchoua, R. (Laboratoire d'Hydrologie et de Geochimie Isotopique, Orsay (France)); Fontes, J.C.; Dever, L.; Naah, E.; Aranyossy, J.F. International Atomic Energy Agency, Vienna (Austria). Oct 1993. (In French). In *Water resources in the Sahel. Hydrogeological and hydrological studies in West Africa by isotopic techniques. Statement of accounts of studies carried out in the framework of the project RAF/8/012: Isotopic hydrology in Sahelian countries.* 211p. Order Number DE95615467. Source: OSTI; NTIS (US Sales Only); INIS.

The stable isotopic content of daily precipitation sampled at Garoua (North Cameroon) shows large variations principally due to the climatic conditions during rain events and to the type of air masses which generated the precipitation. The isotopic values of groundwater suggest, throughout the basin, a rapid and easy recharge of the aquifers by direct infiltration of precipitation. In some places, isotopic enrichment content could be attributed to evaporation processes during precipitation. Groundwater is generally of calcium and sodium bicarbonate type, deriving from the hydrolysis of the sandstone silicate minerals. They are chemically good for drinking water, but localised high concentrations in nitrates indicate a real risk of pollution of the aquifer. Carbon-13

values of the TDIC indicate that the geochemical system is open with respect to the soil-CO_2. Carbon-14 activities, corresponding to modern water, show that the aquifer is currently actively recharged. In some parts however, old waters have been evidenced, corresponding to recharge occurred under more humid conditions than those presently prevailing. (author). 29 refs, 8 figs, 3 tab.

8487 (IAEA-TECDOC–721, pp. 169-179) **In situ measurements of suspended sediment transport in the wadi dourou ("pays Dogon" - Mali).** Sissoko, M.F. (Direction Nationale de l'Hydraulique et de l'Energie, Bamako (Mali). Section Amenagement des Bassins Fluviaux); Diarra, S.; Fofana, A.; Alpha, A. International Atomic Energy Agency, Vienna (Austria). Oct 1993. (In French). In *Water resources in the Sahel. Hydrogeological and hydrological studies in West Africa by isotopic techniques. Statement of accounts of studies carried out in the framework of the project RAF/8/012: Isotopic hydrology in Sahelian countries.* 211p. Order Number DE95615467. Source: OSTI; NTIS (US Sales Only); INIS.

A nuclear gauge has been installed in the riverbed of little wadi in the "pays Dogon" in order to measure the sediment transport during the floods. The region, formed by outcrops of precambrien sandstones and little valleys filled by sandy alluvial deposit, undergoes intense erosion due to violent storms during the rainy season. The phenomenon is furthermore aggravated by deforestation processes which reduce natural infiltration of water and increase surface run-off. Like all water courses on the plateau, the "Dourou" wadi is ephemeral and runs only during the rainy season with very short and violent floods after rain events. The principle of the sediment transport measurements is based on the absorption of gamma rays between a nuclear source (Am-241) and a detector, both installed in the wadi-bed. As the gauge response depends on the geometry of the system (mainly distance source - detector) and on the mineralogic nature of the suspended sediments, a proper calibration curve should be determined before application in the field. Measurements made during the rainy season 1990 and 1991 has shown a sediment transport of some tens to several hundred tons depending on the force of the storms. The total amount during one rainy season has been estimated to about 5,000 tons which would given an average erosion rate of about 10tonnes/km^2/year on the basin. The main advantages of the method consist, especially in remote regions of difficult access, in the possibilities of automatic and continuous measurements. The equipment installed in Mali has provided fundamental information on erosion processes on the "plateau Dogon". In this particular case, however, the geometry of the system would have to be modified in order to enable measurements of the sediment transport at the very beginning of the floods. (author). 10 refs, 7 figs, 1 tab.

8488 (IAEA-TECDOC–721, pp. 187-199) **Volcanic CO_2 contribution in the geochemical and isotopic equilibrium of the TIDC in the Irhazer aquifers (Niger).** Joseph, A. (Niamey Univ., Niamey (Nigeria). Dept. de Geologie). International Atomic Energy Agency, Vienna (Austria). Oct 1993. (In French). In *Water resources in the Sahel. Hydrogeological and hydrological studies in West Africa by isotopic techniques. Statement of accounts of studies carried out in the framework of the project RAF/8/012: Isotopic hydrology in Sahelian countries.* 211p. Order Number DE95615467. Source: OSTI; NTIS (US Sales Only); INIS.

Geochemical and isotopic characteristics of total inorganic dissolved carbone (TIDC) of groundwater bodies in the Irhazer sedimentary basin, do not follow the natural evolution of the balance linked to confinement process. On the other side of a main tectonic accident, we demonstrate an important increase of the alkalinity and of the CO_2 partial pressure, added to an enrichment in carbon-13 content. Among different hypothesis, we take into account a volcanic production of CO_2, $\delta^{13}C_{co2}$ of which is closed to -7 deg./00 PDB. This gas feeds the system through the active "In Azaoua" fracture system. (author). 24 refs, 6 figs, 1 tab.

8489 (IC–94/238) **An approximate inversion method of geoelectrical sounding data using linear and bayesian statistical approaches. Examples of Tritrivakely volcanic lake and Mahitsy area (central part of Madagascar).** Ranaivo Nomenjanahary, F. (Institute of Geophysical Observatory, Antananarivo (Madagascar)); Rakoto, H.; Ratsimbazafy, J.B. International Centre for Theoretical Physics, Trieste (Italy). Aug 1994. 16p. Order Number DE95612415. Source: OSTI; NTIS (US Sales Only); INIS.

This paper is concerned with resistivity sounding measurements performed from single site (vertical sounding) or from several sites (profiles) within a bounded area. The objective is to present an accurate information about the study area and to estimate the likelihood of the produced quantitative models. The achievement of this objective obviously requires quite relevant data and processing methods. It also requires interpretation methods which should take into account the probable effect of an heterogeneous structure. In front of such difficulties, the interpretation of resistivity sounding data inevitably involves the use of inversion methods. We suggest starting the interpretation in simple situation (1-D approximation), and using the rough but correct model obtained as an a-priori model for any more refined interpretation. Related to this point of view, special attention should be paid for the inverse problem applied to the resistivity sounding data. This inverse problem is nonlinear, while linearity inherent in the functional response used to describe the physical experiment. Two different approaches are used to build an approximate but higher dimensional inversion of geoelectrical data: the linear approach and the bayesian statistical approach. Some illustrations of their application in resistivity sounding data acquired at Tritrivakely volcanic lake (single site) and at Mahitsy area (several sites) will be given. (author). 28 refs, 7 figs.

ESAA is an X-window based, graphical and interactive, software system for analyzing seismic activity, using the earthquake catalogues of a given region as input. Basic design idea and structure of this system, as well as the progress in its implementation are reported. (author). 12 refs.

8491 (INIS-mf–14415) **Study of radon-222 emanation from sedimentary phosphates and corresponding phosphogypsum. Temperature effect.** Boujrhal, F.M. Universite Mohammed 5, Rabat (Morocco). Faculte des Sciences. 16 Jul 1993. 186p. (In French). Order Number DE95612386. Source: OSTI; NTIS (US Sales Only); INIS.

The aim of this study is to examine the effect of temperature on radon emanation from the phosphates of various regions of Morocco, from corresponding phosphogypsum and from teeth fossilized of Youssoufia phosphate. The interpretation of obtained results was carried out by the physicochemical studies with various approaches; the X-ray diffraction analysis, the measurement of the specific surface area and porousness, the determination of the oxygen content by activation analysis with 14 MeV neutron. The thermal treatment between 100 and 900 degrees C conducted to the following points: - An increase of the radon degassing rate, which is first slow when the temperature increase from 20 to 600 degrees C, then becomes brutal beyond this temperature. We attributed this variation to the training effect (transport effect) of radon by the others gas susceptible to be released with thermal effect, particularly the CO sub 2. - The reduction of the radon emanation power versus temperature. We could demonstrate a linear correlation between the power emanation and the specific surface area. 122 refs., 102 figs., 20 tabs. (Author).

8492 (INIS-mf–14436, pp. O3.1-O3.11) **International comparison of environmental protection provisions in remedial actions on uranium mine and mill tailings.** Dahlkamp, F.J. No corporate text available. Oct 1993. 157p. (In German). (CONF-9310403–: The mining Pribram in science and technology, Pribram (Czech Republic), 13-16 Oct 1993). In *The mining Pribram in science and technology. Section O: Mining and the environment.* Order Number DE95612417. Source: OSTI; NTIS (US Sales Only); INIS.

For the five major western countries involved in uranium mining and milling (the USA, Canada, Australia, South Africa and France) as well as for Germany, the philosophy is summarized of remedial actions on environmental damage caused by uranium minimg and milling. The related legislation adopted so far in these countries and the responsible authorities are listed. The actual remedial technologies, their management and licensing procedures used in the

countries are described. The situation in the Czech Republic is then briefly characterized. In conclusion recommendations are given for former COMECON countries in general and the Czech Republic in particular, listing a number of individual steps to be taken, including e.g. the removal of leaching solutions from leached ore-bearing strata, compilation of a data base of remedial action concepts and remedial technologies, and the performing of cost-benefit analyses of remedial plans. (A.K.).

8493 (INIS-mf–14436, pp. O4.1-O4.3) **The Institute's view of the use of wastes for environmental remedial actions and land reclamation.** Sirotkova, D. No corporate text available. Oct 1993. 157p. (In Czech). (CONF-9310403–: The mining Pribram in science and technology, Pribram (Czech Republic), 13-16 Oct 1993). In *The mining Pribram in science and technology. Section O: Mining and the environment.* Order Number DE95612417. Source: OSTI; NTIS (US Sales Only); INIS.

The problems of land reclamation in regions affected by uranium ore mining and milling are discussed from the point of view of its effects on man. The health hazards of individual wastes are assessed based on applicable hygienic regulations. Waste is regarded as hazardous if it possesses at least one of the following properties: acute toxicity, serious irreversible delayed effect, serious local caustic effect, potential for the spread of a serious infection. Sludges from wastewater treatment plants are considered to be suitable for land reclamation. (J.B.). 4 refs.

8494 (INIS-mf–14436, pp. O5.1-O5.4) **Results of actions to reduce the amount of radon in the town of Jachymov. The nursery school building.** Domas, J. (Ministerstvo Zivotniho Prostredi, Prague (Czech Republic)); Posmourny, K. No corporate text available. Oct 1993. 157p. (In Czech). (CONF-9310403–: The mining Pribram in science and technology, Pribram (Czech Republic), 13-16 Oct 1993). In *The mining Pribram in science and technology. Section O: Mining and the environment.* Order Number DE95612417. Source: OSTI; NTIS (US Sales Only); INIS.

Radon measurements in some buildings in the town of Jachymov indicated that the limiting volume activities were exceeded substantially. Remedial actions were made in the nursery school building. These included gravitational ventilation of the cellar, fitting of all doors and passages between the cellar and school rooms with packing, installation of overpressure ventilation with heat recuperation, and sealing of all window gaps. (J.B.). 2 refs.

8495 (INIS-RU–378) **Complex probabilistic estimation of seismic resistance of nuclear power plants.** Butorin, S.L. Vsesoyuznyj Nauchno-Issledovatel'skij i Proektnyj Inst. Ehnergotekhniki (VNIPIEhT), Moscow (Russian Federation). 1991. 15p. (In Russian). Order Number DE95615485. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes an approach to quantitative probabilistic assessment of seismic resistance of nuclear power plants. General scheme of NPP seismic reliability assessment is described. A technique is proposed for assessing reliability of plants basic components (ground formations, building structures, process equipment) within the framework of two traditional approaches to the problem of installation seismic resistance: dynamic and linearly-spectral. A quantitative assessment of RBMK-100 plant reliability is presented as an example of probabilistic assessment of nuclear safety function.

8496 (Juel–2925) **Measuring program of the Federal Republic of Germany. Results of environmental measurement in Russia, Byelorussia and Ukraine in the time from May 17 to September 2, 1993, and from October 8 to November 1, 1993.** Heinemann, K.; Hille, R. Forschungszentrum Juelich GmbH (Germany). Abt. Sicherheit und Strahlenschutz. Jun 1994. 139p. (In German). Order Number DE95738044. Source: OSTI; NTIS (US Sales Only); INIS.

This report gives an overview on the results of the environmental measurements 1993, which have been gained in the frame of the measuring program of the Federal Republic of Germany in Russia, Byelorussia and Ukraine. In the time from May 17, to the end of October 18 scientists and engineers conducted environmental measurements and determined the contamination of soil and foodstuff. Samples of food of the population were measured and the results were given in a certificate with short explanation in Russian language. In 3 appendices of this report all results are given in detail. They are discussed in the way of local mean values. In regard to the preceding year the external dose and the soil contaminations are nearly constant. However the milk contaminations decreased with the exception of a few villages. Possible explanations for these exceptions are discussed. (orig.)

8497 (LA–12753-MS) **High explosive spot test analyses of samples from Operable Unit (OU) 1111.** McRae, D.; Haywood, W.; Powell, J.; Harris, B. Los Alamos National Lab., NM (United States). Jan 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95005742. Source: OSTI; NTIS; GPO Dep.

A preliminary evaluation has been completed of environmental contaminants at selected sites within the Group DX-10 (formally Group M-7) area. Soil samples taken from specific locations at this detonator facility were analyzed for harmful metals and screened for explosives. A sanitary outflow, a burn pit, a pentaerythritol tetranitrate (PETN) production outflow field, an active firing chamber, an inactive firing chamber, and a leach field were sampled. Energy dispersive x-ray fluorescence (EDXRF) was used to obtain semi-quantitative concentrations of metals in the soil. Two field spot-test kits for explosives were used to assess the presence of energetic materials in the soil and in items found at the areas tested. PETN is the major explosive in detonators manufactured and destroyed at Los Alamos. No measurable amounts of PETN or other explosives were detected in the soil, but items taken from the burn area and a high-energy explosive (HE)/chemical sump were contaminated. The concentrations of lead, mercury, and uranium are given.

8498 (LA-UR–94-3685) **A brief review of environmental transport of tritium at the Los Alamos LLRW disposal facility.** Vold, E.L. Los Alamos National Lab., NM (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941214–1: 16. US Department of Energy low-level radioactive waste management conference, Phoenix, AZ (United States), 13-15 Dec 1994). Order Number DE95002699. Source: OSTI; NTIS; INIS; GPO Dep.

A large data base of tritium in the environmental the Los Alamos National Laboratory LLRW disposal facility, Area G, is summarized. Tritium in surface and subsurface soil moisture indicates three disposal areas significantly elevated above background with the highest results around the currently used tritium disposal shafts. Airborne concentrations are well below appropriate concentration guidelines but vary seasonally by over an. order of magnitude. Surface efflux measurements show seasonal and diurnal time dependent variations with a positive correlation with ambient temperature. The integral of the surface efflux is estimated as a release on the order of ten Curies/year. A subsurface tritium plume observed in the early seventies has since been greatly reduced indicating an effective half-life in the environment which is significantly shorter than the radiologic half-life. Subsurface migration from the mesa top disposal facility has resulted in tritium in the canyon water immediately adjacent to the disposal site which is marginally elevated above background. The hydrogeologic diffusion near the tritium shafts is compared to model results to predict the vertical extent of the tritium migration. Field work to define this limit and additional quantification of tritium sources and migration is continuing.

8499 (LBL–36211) **Development of hydrogeological modelling approaches for assessment of consequences of hazardous accidents at nuclear power plants.** Rumynin, V.G. (St. Petersburg Mining Inst. (Russian Federation)); Mironenko, V.A.; Konosavsky, P.K.; Pereverzeva, S.A. Lawrence Berkeley Lab., CA (United States). Jul 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95006719. Source: OSTI; NTIS; INIS; GPO Dep.

This paper introduces some modeling approaches for predicting the influence of hazardous accidents at nuclear reactors on groundwater quality. Possible pathways for radioactive releases from nuclear power plants were considered to conceptualize boundary conditions for solving the subsurface radionuclides transport problems. Some approaches to incorporate physical-and-chemical interactions into transport simulators have been

developed. The hydrogeological forecasts were based on numerical and semi-analytical scale-dependent models. They have been applied to assess the possible impact of the nuclear power plants designed in Russia on groundwater reservoirs.

8500 (NEI-DK–1754) **Winter meeting on ground water pollution.** Akademiet for de Tekniske Videnskaber, Lyngby (Denmark). 1993. 242p. (In Danish). (CONF-9303327–: Winter meeting on ground water pollution, Bredsten (Denmark), 2-3 Mar 1993). Order Number DE95737555. Source: OSTI; NTIS.

8501 (NEI-DK–1754, pp. 31-41) **Organic micro-pollutions in ground water resources, cleaning and water usage.** Arvin, E. (Laboratoriet for tekniske Hygiejne, Danmarks Tekniske Hoejskole (Denmark)). Akademiet for de Tekniske Videnskaber, Lyngby (Denmark). 1993. (In Danish). (CONF-9303327–: Winter meeting on ground water pollution, Bredsten (Denmark), 2-3 Mar 1993). In *Winter meeting on ground water pollution.* 242p. Order Number DE95737555. Source: OSTI; NTIS.

A short survey is given of sources of organic pollutive substances and of what has actually been found in Danish groundwater. Possibilities for cleaning the water and the criteria for the use of water and the criteria for the use of water containing micro-pollutants, are discussed. Micro-pollution is the term used for a concentration of substances of 1 μg/l. It is generally concluded that Danish groundwater resources are polluted with organic substances and chemicals only to a limited degree as a result of human activities. (AB) (14 refs.)

8502 (NEI-DK–1754, pp. 43-58) **New method for cleaning ground water which contains chromate.** Christensen, T. (I. Krueger A/S (Denmark)); Aktor, H. Akademiet for de Tekniske Videnskaber, Lyngby (Denmark). 1993. (In Danish). (CONF-9303327–: Winter meeting on ground water pollution, Bredsten (Denmark), 2-3 Mar 1993). In *Winter meeting on ground water pollution.* 242p. Order Number DE95737555. Source: OSTI; NTIS.

A pilot system for cleaning ground water that has been polluted with chromates and sulphates leached from deposited fly ash is described. The cleaning method was found to be satisfactory for removing chromates, the use of iron was minimal and the process was simple. (AB) (13 refs.)

8503 (NEI-DK–1754, pp. 157-170) **What is the actual diffusion of pollutants through the earth surface/cellar floor? Can flux-chamber measurements give an answer?.** Wille, E. (Dansk Teknologisk Institut. Miljoeteknik (Denmark)). Akademiet for de Tekniske Videnskaber, Lyngby (Denmark). 1993. (In Danish). (CONF-9303327–: Winter meeting on ground water pollution, Bredsten (Denmark), 2-3 Mar 1993). In *Winter meeting on ground water pollution.* 242p. Order Number DE95737555. Source: OSTI; NTIS.

A method of measurement of the diffusion of hydrocarbons into buildings from polluted soil is described, especially with regard to the use of a flux chamber a half-sphere placed directly on the surface through which the flux should be measured. (au)

8504 (NEI-DK–1754, pp. 171-185) **Diffusion of volatile organic components through concrete floors.** Kirkegaard, C. (Geoteknisk Institut, ATV (Denmark)); Holm, J. Akademiet for de Tekniske Videnskaber, Lyngby (Denmark). 1993. (In Danish). (CONF-9303327–: Winter meeting on ground water pollution, Bredsten (Denmark), 2-3 Mar 1993). Source: OSTI; NTIS.

The dissolution of the water-soluble components from an oil plume into groundwater represents the most direct threat to groundwater quality following a subsurface oil spill. This process is dependent, amongst other factors, on the migration of the bulk oil within the subsurface. An experimental study of the subsurface migration of both the miscible and immiscible components following a light oil spill in an unconfined aquifer is presented. Using two-dimensional groundwater flumes, two controlled spills of a light oil above a sloping groundwater table were performed. During the first spill the movement of the immiscible bulk oil in the unsaturated and saturated zones was monitored using time-lapse video, as well as a dual gamma attenuation device. For the second spill water samplers were installed downstream of the spill and a single water-soluble component added to the injected oil. Observations of the miscible contaminant plume were obtained by gas chromatography analysis of water samples downstream of the plume. It was found that the transfer of the water-soluble components is controlled by the multiphase flow of the bulk oil within the saturated and unsaturated zone. The front of the developing miscible flume appears confined to the capillary fringe. Dye tracing of the groundwater flow shows this is consistent with the flow of water around the oil plume. Such long narrow plumes may reduce the effectiveness of conventional contaminant recovery schemes and complicate plume delineation. (AB)

8507 (NEI-DK–1755, pp. 157-161) **Contaminant transport at a waste incinerator residue deposit. 2D hydrogeochemical modelling.** Traberg, R. (Institute og Hydrodynamics and Hydraulic Engineering/Groundwater Research Centre, Technical University of Denmark (Denmark)); Engesgaard, P. Akademiet for de Tekniske Videnskaber, Lyngby (Denmark). 1993. (CONF-9311278–: ATV meeting on research projects on ground water pollution, Lyngby (Denmark), 17 Nov 1993). A 2D hydrogeochemical model based on the USGS programs MOC and PHREEQE has been developed and applied to an accidental aquifer contamination, where ion exchange was the controlling geochemical reaction. MOC has the advantage of introducing little numerical dispersion, which is here shown to be essential for hydrogeochemical transport modelling. Simulation of component breakthrough curves from a laboratory column experiment showed very good agreement with measured concentrations. The calibrated geochemical parameters were subsequently utilized for aquifer contamination modelling. At the field scale, the overall patterns of movement of the various components were simulated correctly, but with deviations from the observations when comparing with individual components from well to well. 8508 (NEI-SE–180) **Chernobyl cesium in the Swedish moose population: Effect of age, diet and habitat selection.** Nelin, P. Swedish Univ. of Agricultural Sciences, Umeaa (Sweden). Dept. of Animal Ecology. 1994. 28p. Order Number DE95612388. Source: OSTI; NTIS; INIS.

The most important game in Sweden is moose (Alces alces (L.)). To study the ^{137}Cs levels in moose, hunters were asked to send in moose meat for analysis. About 6500 samples were analysed from 1986-1993. There was a positive correlation between the fall-out of cesium from Chernobyl and the cesium concentration in moose. The differences in ^{137}Cs concentration between moose of the same age and sex, results from individual moose consuming plants of different ^{137}Cs concentrations, due to the use of different habitat types. The differences in ^{137}Cs levels between years probably depends on between-year variation in habitat utilization due to the

weather. During warm summers and autumns, moose utilize more wetlands (cool habitats during warm days) or mature forests (which are shady during sunny days) and consume the plants (of high ^{137}Cs levels) found there, whereby their meat will have a higher ^{137}Cs concentration. If, during colder summers, moose instead use farmlands or clear-cut forest areas and consume the plants (of low ^{137}Cs levels) found there, a lower ^{137}Cs concentration will be the case. The ^{137}Cs concentration in moose also fluctuates seasonally depending on diet, i.e. there are high average concentrations and large differences between individual moose killed during the plant growing season, but low ^{137}Cs concentrations and low variation between individuals and years, for moose killed during the winter. The analyses of ^{137}Cs in moose and its food plants from before and after the Chernobyl accident indicates that the ^{137}Cs from Chernobyl will stay in the northern forest ecosystem for a long time. The physical decay (30.2 years) seems to be the major factor for its disappearance from the ecosystem. I also expect that the fluctuation between years in the ^{137}Cs concentration will persist, although decrease in maximum values. 44 refs, 7 figs.

8509 (NUREG/CR–6136) **Uncertainty and sensitivity analysis of food pathway results with the MACCS Reactor Accident Consequence Model.** Helton, J.C. (Arizona State Univ., Tempe, AZ (United States)); Johnson, J.D.; Rollstin, J.A.; Shiver, A.W.; Sprung, J.L. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 90p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–93-2372). Source: OSTI; NTIS (documentation only); ESTSC (complete software package), P.O. Box 1020, Oak Ridge, TN 37831-1020 (United States); GPO; INIS.

Uncertainty and sensitivity analysis techniques based on Latin hypercube sampling, partial correlation analysis and stepwise regression analysis are used in an investigation with the MACCS model of the food pathways associated with a severe accident at a nuclear power station. The primary purpose of this study is to provide guidance on the variables to be considered in future review work to reduce the uncertainty in the important variables used in the calculation of reactor accident consequences. The effects of 87 imprecisely-known input variables on the following reactor accident consequences are studied: crop growing season dose, crop long-term dose, milk growing season dose, total food pathways dose, total ingestion pathways dose, total long-term pathways dose, area dependent cost, crop disposal cost, milk disposal cost, condemnation area, crop disposal area and milk disposal area. When the predicted variables are considered collectively, the following input variables were found to be the dominant contributors to uncertainty: fraction of cesium deposition on grain fields that is retained on plant surfaces and transferred directly to grain, maximum allowable ground concentrations of Cs-137 and Sr-90 for production of crops, ground concentrations of Cs-134, Cs-137 and I-131 at which the disposal of milk will be initiated due to accidents that occur during the growing season, ground concentrations of Cs-134, I-131 and Sr-90 at which the disposal of crops will be initiated due to accidents that occur during the growing season, rate of depletion of Cs-137 and Sr-90 from the root zone, transfer of Sr-90 from soil to legumes, transfer of Cs-137 from soil to pasture, transfer of cesium from animal feed to meat, and the transfer of cesium, iodine and strontium from animal feed to milk.

8510 (OPRI-RM–06-1994) **Monthly results of measurements; Jun 1994.** Office de Protection contre les Rayonnements Ionisants, 78 - le Vesinet (France). 1994. 56p. (In French). Order Number DE95615468. Source: OSTI; NTIS (US Sales Only); INIS.

This report of the OPRI (Office of Protection against Ionizing Radiations) exposes the principal results concerning the routine monitoring of environmental radioactivity in France: atmospheric dusts, rainwater, surface water, underground water, sewage water, drinking water, food chain (milk, vegetables, fishes), sea water around nuclear sites and other sites. The activities of various radioisotopes are presented in tables.

8511 (ORNL/TM–12886) **Fall 1994 wildlife and vegetation survey, Norton Air Force Base, California.** Oak Ridge National Lab., TN (United States). 15 Dec 1994. 29p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95004875. Source: OSTI; NTIS; INIS; GPO Dep.

The fall 1994 wildlife and vegetation surveys were completed October 3-7, 1994, at Norton Air Force Base (AFB), California. Two biologists from CDM Federal Programs, the U.S. Environmental Protection Agency (EPA) regional biologist and the Oak Ridge National Laboratory (ORNL) lead biologist conducted the surveys. A habitat assessment of three Installation Restoration Project (IRP) sites at Norton Air Force Base was also completed during the fall survey period. The IRP sites include: Landfill No. 2 (Site 2); the Industrial Wastewater Treatment Plant (IWTP) area; and Former Fire Training Area No. 1 (Site 5). The assessments were designed to qualitatively characterize the sites of concern, identify potential ecological receptors, and provide information for Remedial Design/Remedial Action activities. A Reference Area (Santa Ana River Wash) and the base urban areas were also characterized. The reference area assessment was performed to provide a baseline for comparison with the IRP site habitats. The fall 1994 survey is the second of up to four surveys that may be completed. In order to develop a complete understanding of all plant and animal species using the base, these surveys were planned to be conducted over four seasons. Species composition can vary widely during the course of a year in Southern California, and therefore, seasonal surveys will provide the most complete and reliable data to address changes in habitat structure and wildlife use of the site. Subsequent surveys will focus on seasonal wildlife observations and a spring vegetation survey.

8512 (PNL–10195) **Three-dimensional conceptual model for the Hanford Site unconfined aquifer system: FY 1994 status report.** Thorne, P.D.; Chamness, M.A.; Vermeul, V.R.; Macdonald, Q.C.; Schubert, S.E. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 106p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95004225. Source: OSTI; NTIS; GPO Dep.

This report documents work conducted during the fiscal year 1994 to development an improved three-dimensional conceptual model of ground-water flow in the unconfined aquifer system across the Hanford Site Ground-Water Surveillance Project, which is managed by Pacific Northwest Laboratory. The main objective of the ongoing effort to develop an improved conceptual model of groundwater flow is to provide the basis for improved numerical report models that will be capable of accurately predicting the movement of radioactive and chemical contaminant plumes in the aquifer beneath Hanford. More accurate ground-water flow models will also be useful in assessing the impacts of changes in facilities and operations. For example, decreasing volumes of operational wastewater discharge are resulting in a declining water table in parts of the unconfined aquifer. In addition to supporting numerical modeling, the conceptual model also provides a qualitative understanding of the movement of ground water and contaminants in the aquifer.

8513 (PSI–94-21) **Colloid properties in groundwaters from crystalline formations.** Degueldre, C.A. (Paul Scherrer Inst. (PSI), Villigen (Switzerland)). Paul Scherrer Inst. (PSI), Villigen (Switzerland). Sep 1994. 104p. Order Number DE95612389. Source: OSTI; NTIS; INIS.

Colloids are present in all groundwaters. The role they may play in the migration of radionuclides in the geosphere must be studied. Colloid sampling and characterisation campaigns have been carried out in Switzerland. On the bases of the results from studies in various areas, a consistent picture is emerging. The groundwater colloids in crystalline formations are predominantly comprised of phyllosilicates and silica originating from the aquifer rock. Under constant hydrogeochemical conditions, the colloid concentration is not expected to exceed 100 $ng.ml^{-1}$ when the calcium concentration is greater than 10^{-4}. However, under transient chemical or physical conditions, such as geothermal or tectonic activity, colloid generation may be enhanced and the colloid concentration may reach 10 $\mu g.ml^{-1}$ or more, if both the calcium and sodium concentrations are low. In the Nagra Crystalline Reference Water the expected colloid concentration is <100 $ng.ml^{-1}$. This can be compared, for example, to a colloid concentration of about 10 $ng.ml^{-1}$

found in Zurzach water. The small colloid concentration in the reference water is a consequence of an attachment factor for clay colloids close to 1. A model indicates that at pH 8, the nuclide partition coefficients between water and colloid (K_p) must be smaller than 10^7 $ml.g^{-1}$ if sorption takes place by surface complexation on colloids, ≡ AlOH active groups forming the dominant sorption sites. This pragmatic model is based on the competition between the formation of nuclide hydroxo complexes in solution and their sorption on colloids. Experimental nuclide sorption data on colloids are compared with those obtained by applying this model.

8514 (SKB-TR–94-09) **Tectonic framework of the Hanoe Bay area, southern Baltic Sea.** Wannaes, K.O. (Stockholms Univ. (Sweden). Dept. of Geology and Geochemistry); Floden, T. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jun 1994. 49p. Order Number DE95615486. Source: OSTI; NTIS; INIS.

The tectonic framework and the general geologic development of the Hanoe Bay, from the Scanian coast in the west to south of Oeland in the east, has been investigated by means of reflection seismic methods. The Hanoe Bay is in this paper subdivided into four areas of different geologic settings. These are: (1) The Hanoe Bay slope, which forms a southward dipping continuation of the rigid Blekinge coastal plain. (2) The eastward dipping Kalmarsund Slope, which southwards from Oeland forms the western part of the Paleozoic Baltic Syneclise. (3) The Mesozoic Hanoe Bay Halfgraben, which forms the central and southern parts of the Hanoe Bay. The ongoing subsidence of the Halfgraben is estimated to be in the order of 20-60 m during the Quaternary. (4) The Yoldia Structural Element, which forms a deformed, tilted and possibly rotated block of Paleozoic bedrock located east of the Hanoe Bay Halfgraben. Two tectonic phases dominate the post-Paleozoic development of the Hanoe Bay, these are: (1) The Early Kimmerian phase, which initiated subsidence and reactivated older faults. (2) The Late Cretaceous phase, which is the main subsidence phase of the Hanoe Bay Halfgraben. The tectonic fault pattern of the Hanoe Bay is dominated by three directions, i.e. NW-SE, NE-SW and WNW-ESE. The two main tectonic elements of the area are the Kullen-Christiansoe Ridge System (NW-SE) and the Bornholm Gat Tectonic Zone (NE-SW). Sinistral strike-slip movements in order of 2-3 km are interpreted to have occurred along the Bornholm Gat Tectonic Zone during the late Cretaceous. 20 refs, 19 figs.

8515 (SLU-EKOMIL-R–68) **Modelling the impacts of sulphur and nitrogen deposition on forests.** Oene, Harmke van. Swedish Univ. of Agricultural Sciences, Uppsala (Sweden). Dept. of Ecology and Environmental Research. 1994. 28p. Order Number DE95737672. Source: OSTI; NTIS.

In this thesis the effects of sulphur and nitrogen deposition on forests are analysed. Two different models, an ecosystem model, and a model that describes uptake of cations, were developed with the purpose of increasing the understanding of the effects of air pollutants on the long-term nutrient availability for forest growth. In addition, the limitations and consequences of the models used to analyse effects of air pollutants on forest were studied in a comparison of different models and model descriptions. The ecosystem model showed that imbalances between nutrients in the leaf biomass of trees are causally related to decreased nutrients stores in forests affected by leaching induced by acid deposition. High forest growth levels are attained by the fertilizing effect of nitrogen deposition. The uptake model showed that aluminium affect the uptake of cations negatively through changes in root surface chemistry that can be interpreted as decreasing the uptake capacity of the roots. Increased concentrations of Ca and Mg can mitigate the negative Al effects. However, Ca and Mg appeared to be antagonists by affecting each others uptake negatively. In the field, Al may, through its inhibiting effect on uptake of cations, be a contributing factor to the nutritional imbalances observed in trees affected by air pollutants. The magnitude of this effect is also dependent on tree growth rate and supply rates of nutrients. A reduction in nitrogen deposition is required to compensate an additional scarcity of base cations induced by the recently decreased deposition of these ions. A future reduction in forest growth will occur by reduced supply rates of either base cations or nitrogen. This reduction should be viewed against the increased present-day forest growth. Attention needs therefore to be directed at the effects of air pollutants on the sustainability of forest ecosystems. 78 refs, 10 figs

8516 (SNV–4244) **Eutrophication of soil, fresh water and the sea.** Persson, Gunnar (comp.) (Swedish Environmental Protection Agency, Solna (Sweden)). Swedish Environmental Protection Agency, Solna (Sweden). 1994. 209p. Order Number DE95737655. Source: OSTI; NTIS.

The report is one in a series produced by the Swedish Environmental Protection Agency, project 'The environment in Sweden - status and trends (MIST)'.

The term 'eutrophication' is used here to refer to the increased input or availability of plant nutrients, especially nitrogen and phosphorus. It is primarily the biological effects of the increased supply of nutrients that lead to noticeable changes and problems. These effects are therefore often included in the concept of eutrophication. We distinguish however between eutrophication and its biological effects and can therefore apply the term to media in which direct biological effects are lacking, such as atmosphere and groundwater. This report is based on 5 background reports and follows the plant nutrients via the atmosphere, natural terrestrial ecosystems, agricultural systems, groundwater, watercourses/lakes and sea/coast. 195 refs, 62 figs, 21 tabs

8517 (VF-BIO–94-5) **Cadmium in Salix. A study to show the capacity of Salix to remove cadmium from farmland.** Oestman, G. (Umeaa Univ. (Sweden)). Vattenfall Utveckling AB, Vaellingby (Sweden). 16 Jun 1994. 39p. (In Swedish). Project Bioenergy-UB93-843. Order Number DE95615487. Source: OSTI; NTIS; INIS.

The aim of this report has been to show the ability of Salix to take up cadmium and how the uptake varies between different types of soil. The information that the results are based on has been obtained from analyses of soil and Salix. The samples were taken at five sites in the district around Lake Maelaren. Two or three stands were taken at each place. The factors studied were the pH, the organic matter content, and the concentration of cadmium in the soil. Salix has a good ability, relative to other crops, to remove cadmium from arable land. The cadmium uptake is 35 times higher with Salix than with straw or energy grass. Salix uptake of cadmium varies between 3 and 14% of the cadmium content in the soil that is accessible to plants. The present annual increase of cadmium in arable land is 1 g/ha, whereas the removal in a Salix plantation is 21 g Cd/ha, yr at an annual growth of 10 tonnes DM. If the Cd uptake is the same each year, then a total of 420 g Cd/ha is removed when Salix is grown over a 20-year period. This is a very large part of the topsoil's total cadmium content, which is 550 g/ha on average in Sweden. The investigation reveals no clear relationship between the Cd concentration in Salix and the concentration of Cd in the soil, the organic matter content or the pH. 22 refs, 4 figs, 2 tabs.

8518 (WHC-EP–0446-2) **Quality Assurance Project Plan for Facility Effluent Monitoring Plan activities.** Frazier, T.P. Westinghouse Hanford Co., Richland, WA (United States). 20 Oct 1994. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95002361. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Project Plan addresses the quality assurance requirements for the activities associated with the Facility Effluent Monitoring Plans, which are part of the overall Hanford Site Environmental Protection Plan. This plan specifically applies to the sampling and analysis activities and continuous monitoring performed for all Facility Effluent Monitoring Plan activities conducted by Westinghouse Hanford Company. It is generic in approach and will be implemented in conjunction with the specific requirements of the individual Facility Effluent Monitoring Plans.
